THE BUILDERS' JOURNAL

AND ARCHITECTURAL RECORD

APPEALING TO THOSE ENGAGED IN

THE ART OF BUILDING.

IT is our aim, our ambition, our aspiration even, to build our Journal worthily and well, not for the hour only, but for future years; for the few men in the forefront of an enduring and a laborious Art; for the disciplined ranks of a distinguished Profession; for the young men—Architects to be—and for all who love a clustered column or a flying buttress, a traceried window or a Greek frieze, for the man, too, who honestly plumbs a jamb. . . . . .

EFFINGHAM HOUSE,
ARUNDEL STREET, STRAND,

THE BUILDERS' JOURNAL & ARCHITECTURAL RECORD
WITH SURVEYING AND SANITARY SUPPLEMENTS.

AUGUST 9, 1899.
No. CCXXXV.

EFFINGHAM HOUSE,
ARUNDEL STREET,
STRAND, W.C.

An Architectural Causerie.

Basis of Contract. UNDER most building contracts, the "undertaking" is to perform certain works described by means of drawings and specification within a given period of time for a definite sum of money. Alternatively with this there is in use by some architects a system under which the undertaking is to perform such works as are described in a bill of quantities, reference being still made to drawings and specifications for the relative positions of various parts of the works, and for their quality. Which is the better system is a moot question, each having strong advocates. On behalf of the first named it is argued that, with properly prepared quantities, the estimate tendered by the builder should be an accurate estimate of the value of the whole work; that it is the intention of the building owner and of his architect that the whole building as set forth should be erected, and that it is most convenient for all parties to contract on this basis, and leads to fewest disputes. The advocates of the alternative system contend that, granted accurate quantity surveying, the result is the same in either case, but that in the event of inaccuracies, which even the most careful surveyors will occasionally be guilty of, it is only just that the quantity of work included in the quantity bill, from which the builder's estimate was prepared, should alone be executed without extra charge. This last argument would be an exceedingly powerful one but that in practice it is found to act usually in the builder's favour only. It is quite rare for a building owner, or anyone on his behalf to check against the quantities, to ascertain during the progress of the works the exact amount actually executed; while this is invariably done on the builder's behalf where proper books are kept; and the practical result of basing the contract upon the quantities is frequently the presentation on completion of a considerable bill for extras, which it is then difficult to check without great expense, without a corresponding bill of omissions. In fact, to base a contract upon quantities is almost to compel entire remeasurement during and after completion, the original priced quantities then becoming little more than a schedule of rates, the total, even though named in the contract, being well understood by both parties to it to be but an approximation to the eventual cost of the building, and the expense of remeasurement having in any case to be added. Probably it would be found that neither system was best under all circumstances. In the many cases, especially in the provinces, where no proper quantities are prepared, or where builders prepare their own, the alternative system is obviously out of the question, and in most instances of straightforward building operations, where the original quantities have been prepared by a skilled surveyor, the advantage to neither side would be sufficient to compensate for the cost and trouble of closely checking the amount of work actually done, either during construction or subsequently. On the other hand, when much variation from the plans is anticipated, or when dealing with alterations, or with treacherous foundations, or in any case when it is difficult to tell in advance how much work will actually be performed, to base the contract upon quantities, or upon schedule, is the only just plan to pursue.

G. A. T. M.

Post Office Architecture. THE key-note of all modern post office building was sounded by the First Commissioner of Works, the now almost forgotten Professor Ayrton, in 1873, when performing the official ceremony of opening that vast block opposite the old General Post Office in St. Martin's-le-Grand, which is now known by the official title of "G.P.O., West." The building was inaugurated amid a cloud of official apologetics, deprecatory of the severe criticisms to which it had been subjected by both lay and professional opinion during the course of its construction. The Department was then on its own defence, and it was considered necessary to attempt to show that the exigencies of public business necessitated a departure from accepted architectural models. Professor Ayrton undertook the task of defending the new and ugly pile as against the classic General Post Office building on the other side of the road, and he did it in bold, not to say militant, style. Architecture was nothing to him but a pile of stones and bricks and mortar, going towards providing a certain number of offices for departmental use. "I have read criticisms of the style in which this building has been designed," he said, "but it is an example of the post office order of architecture, and an admirable specimen of its class." Was the First Commissioner making an elaborate play upon words when he spoke of the "Post office order," or was it just an inevitable conjunction of phrases? At any rate, he was serious enough in his defence of the unnamed official draughtsman who designed the huge building. Since that official pronouncement we have naturally been led to expect all new post office buildings to be designed in a spirit of frank utilitarianism; nor have we been disappointed in that expectation. Indeed, all expectations have been exceeded in this direction, and succeeding First Commissioners have diligently crossed the t's and dotted the i's of their predecessors; and so we go from bad to worse. Professor Ayrton's pet, "G.P.O., West," was bad, and they made it worse in after years by building another storey on to it, but it is infinitely better than that other great barrack, completed, after seven years' unremitting labour, in 1895—the supremely unlovely, Cyclopean block called "G.P.O., East." From first to last something like £600,000 was spent upon site and building, and it might well have been supposed that a structure of so costly a nature, and of such national importance would have been designed in a manner worthy of its cost, site, and use. Unhappily, these considerations have not weighed in the least with Her Majesty's Office of Works, and it needs only for the reader of these lines to examine the place, to arrive at the conclusion that for elaborate meanness and coarse workmanship it would be difficult to match. The acme of bad designing is seen in the shapeless, squalid courtyard, designed for the admission of light and air, but failing in the object; while, for decoration, let the passing architectural student glance at the carved keystone masks of the entrance archways, "ornamented" with portrait-heads of departed Postmasters General. In short, the veriest city warehouse is nowadays more likely to be a building with some pretensions to architectural art than any Government building of the Middle or Late Victorian periods.

C. G. H.

THE CASTLE ARCH, GUILDFORD. DRAWN BY SYDNEY NEWCOMBE. (*See p.* 3.)

Incomplete London.

There is nothing, perhaps, more striking to a foreigner or a casual visitor in London than its incomplete arrangements in many parts, its patches of unfinished ornament, its spaces without any central object, its arches without groups, and pedestals without heroes. Hyde Park Corner is a case in point. Here, some years ago, there was an effective group of buildings; two leafy parks, the colonnade, Apsley House, St. George's Hospital, and above all Wellington towering, grim and colossal, over an arch of triumph. Two lines of traffic crossed here, and caused the usual stoppages; to give relief, it was resolved to round off the corner of the Green Park and alter the position of the arch. The modelling of the horse was much objected to; so were the Duke's cocked hat and cloak, so horse and man were taken down and removed to Aldershot, the arch was set back, and a new statue was put up in the midst of the large space thus created. The result was startling. All the buildings seemed to have been removed to a distance, the inevitable consequence of altering the position of the arch and denuding it of its equestrian figure. The arch stands beside the main line of traffic to Victoria, instead of facing it, and is placed at an angle of the "Corner," a position without a parallel for absurdity in the world; its effect is completely lost. So dwarfing, and even obliterating, is an open space to objects not proportioned to it, that the new Wellington statue attracts no attention; the enormous stream of vehicles and pedestrians surges round it, but if removed to Aldershot like its predecessor, the public would not notice the change. A far larger and more commanding group was required for the central object of so extended a clearing. And, curious as the position of the arch now is, it is rendered worse by its incomplete character; it loudly calls for a bold group of statuary to crown it. Will it ever receive it? Another structure also demands completion here; this is the screen and gateway forming the entrance to Hyde Park. It was designed by Decimus Burton, and is an excellent example of a light, open colonnade with three arches for traffic, marking the entrance without hiding the trees and space within; in short it is "garden architecture," where artificial and natural features are pleasantly contrasted. But it has, nevertheless, an unfinished air; three groups are required here, of moderate size, proportioned to the structure. Attempts at improvement have been many of late years in London, but all are more or less marred by a separation of use and beauty. The Regent's Circus, Piccadilly, illustrates this: formerly it was a circus, now it is not; a much needed street was opened in Shaftesbury Avenue, but the new buildings and the old do not harmonise; care should have been taken to replace the old grouping of structures by a new one, but here "every man has had his will, and nobody his way," and the result, though "handsome" in the modern sense, is confused and disconnected. Passing eastwards, we find at either end of Blackfriars Bridge, four immense pedestals, palpably intended for statuary. Upon one of these some time since was placed a large equestrian model in plaster of Francis I. of France, in all the bravery of the sixteenth century, equipped as for a tournament. After a time it disappeared, and why he should have been chosen to decorate a London thoroughfare none can say. Statuary is too much neglected as a detail of architecture; money is squandered upon buildings but grudged for sculpture, yet Wren declared that used in this way there was nothing more effective.

J. C. P.

On Reflection.

Le Castel Berenger.

"Le Castel Bérenger" is the name given by M. Hector Guimard to the curious structure which he has designed for Madame Fournier. It may be considered a sign of the times, and perhaps portends an architectural revolution in Paris. Singularly enough, it is placed in Passy, an old suburban quarter where "villas" abound—not the endless lines of monotonous little bay-windowed houses now incorrectly so styled, but more resembling our older detached and gardened residences, such as those still left by the Great Central Railway in St. John's Wood. Like, yet unlike, for the revived Tudor and Elizabethan villas of that pretty neighbourhood are of brick and stucco; those of Passy are of light Creil stone. But more noticeable, perhaps, is the contrast in style; severity, coldness even, is the note of the French outline, with marked symmetry in design. The Mansard roof, though effective, gives rather a pompous air to a small residence. Until the great development of steel and iron construction in the last few years, and the raising of buildings to a great height, there was nothing more noticeable about French architecture than its conservatism. Is all this about to be cast to the winds? The "Castel" is seven stories high, and resembles a block of flats. It is not only in its proportions that it varies from the regular type of French dwelling-house; the materials are quite differently disposed, and a "staircase hall" in red brick runs through a stone front *vertically*. There is much ironwork visible, as in all French designs, where, in fact, it is generally a strong point, but here again tradition is cast to the winds. Usually simple and restrained, it is in the "Castel" erratic to a degree, and conveys the idea—purposely, it would seem—of insecurity, of iron grilles being off their hinges, and of the building being about to fall. A curious sweeping flourish is carried through the ironwork, resembling now a twirl with a paint-brush, now a flying thong of a whip; the same midsummer madness runs through the interior, and extends to carpets, hatpegs, mirrors, and almost all details. France is the land of the unexpected; of long periods of submission, broken by sudden outbursts, but to certain leading principles of art she has hitherto been constant. At the Renaissance she adopted a national style which is not without grandeur, but which has the fault, perhaps, of being very strictly conventionalised. Is it to be abandoned, and with it all artistic restraint? The spoiling of Paris would be a loss to the world.

Railways and Beauty.

It is, perhaps, somewhat too hastily assumed—probably on the authority of Mr. Ruskin—that a railway is necessarily an ugly thing. There are landscapes to which, it might be contended with some reason, the cutting of a railway has given additional charm. But, however this may be, it is undoubtedly true that, in another sense, railways form one of the most potent means for ministering to our desire for and appreciation of the beautiful in Nature and in Art. Of the many thousands who, during these holiday weeks, are gaining rest, recreation, and artistic inspiration, amidst the beautiful scenes of wood and dale, mountain and moorland, how few there are who do not owe their opportunity for doing so to the despised locomotive. So, too, in regard to the works of man; the cathedrals and abbeys, the noble public buildings and picturesque cottage homes, the treasures of art galleries at home and abroad, to which we look for enjoyment and instruction, would be for most of us as inaccessible as if they were situated in another planet, were it not for the facilities for travel afforded by our railways. Whether these facilities are all they might be is another question, and with that we are not now concerned. There is a passage in one of Mr. Ruskin's books, in which he contrasts the case of the Coniston peasant of a former generation, who, wishing to reach the town of Ulverstone, would take a lovely and health-giving walk of twelve miles by lake and sea, with that of his successor to-day who makes the journey by rail, and arrives at his destination "jaded, half drunk, and otherwise demoralised, and three shillings, at least, poorer than in the morning. Of that sum, a shilling has gone for beer, threepence to a railway shareholder, threepence in coals, and eighteenpence has been spent in employing strong men in the vile mechanical work of making and driving a machine, instead of his own legs, to carry the drunken lout. The results—absolute loss and demoralisation to the poor on all sides, and iniquitous gain to the rich." The picture, though overdrawn, has no doubt a germ of truth in it as regards the Coniston peasant, but for the great majority of mankind the delights of a Lakeland ramble are only possible at the price of much of this "vile mechanical work" which, in view of its serviceableness to the majority of mankind is by no means to be regarded as ignoble.

A Competition at Blackburn.

The latest example of the peculiar ideas of building committees on the subject of architectural competitions comes from Blackburn. The Committee of the proposed Nurses' Home in that town invited plans for the new building, and appointed Mr. Alfred Culshaw, of Liverpool, to act as assessor. The assessor awarded the first premium to Messrs. Cheers and Smith, and the second to Messrs. Fairbrother and Hall, and gave his reasons for this choice in a report which the Committee have allowed to be published in a local newspaper. Instead of adopting their assessor's suggestions, the Committee have selected the plans of Messrs. Stones and Stones, and the only answer they make to the inevitable comment to which their action gives rise is that they have given full weight to the assessor's award, and that they reserved to themselves the right to select any design. As we have not seen the designs submitted, we can say nothing as to their relative merits, except that it is far more likely that a distinguished architect would choose the best design than that a body of men, presumably without professional knowledge, would do so. It is, of course, quite a usual thing for a committee to reserve to themselves the right to select a design other than that recommended by the assessor. But the appointment of a professional assessor implies an intention to be guided by his advice, unless any very special reason should arise for ignoring it. If such a reason exists in the present case, the Committee ought to make it known. To allow the publication of the assessor's report, and withhold their reasons for setting that report aside, is to allow judgment to go against themselves by default. An explanation of their action is equally due to the assessor whose advice they have treated with such scant respect; to the competing architects, who may reasonably expect to know that their designs have been fairly considered, and not capriciously passed over; and to the subscribers to the building fund, who have a right to the assurance that their money will be laid out to the best possible advantage.

GUILDFORD.

SOME HOLIDAY NOTES.

BY SYDNEY NEWCOMBE.

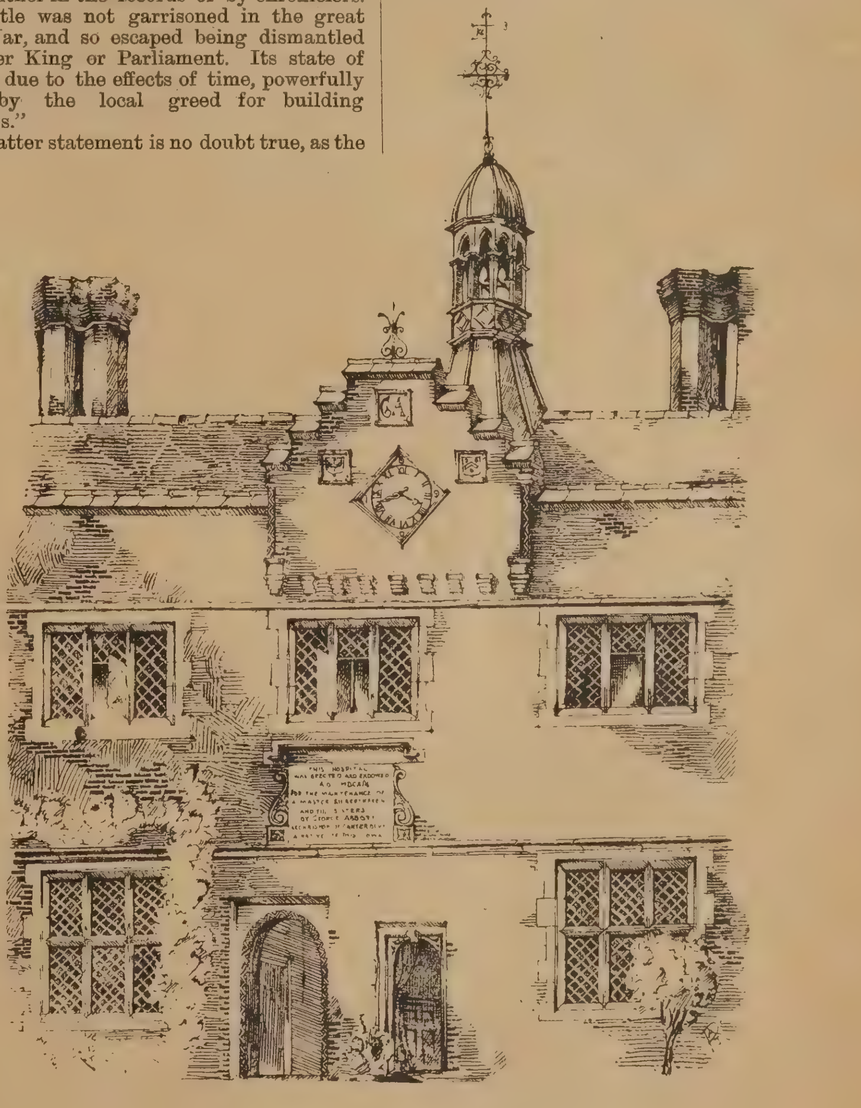
AMONG the many places of interest within a short distance of London, few can compare with Guildford, the county town of Surrey. Situated on the banks of the Wey, and in the midst of beautifully wooded scenery, its landscape appeals as much to the artist as do its quaint old buildings to the architect. It consists principally of one main street—High Street—which rises on a steep ascent from the river to an eminence from which one beholds a panorama of surrounding scenery so beautiful as to be almost beyond description. A peep down at the old town on a summer's day, with its red tile roofs and red brick chimneys, and here and there wreaths of smoke lazily rising skywards, is a sight to be remembered, and well repays the climb. To the westward rises the chalk ridge known as the Hog's Back, while to the eastward lie the Merrow Downs, and a stretch of beautiful country as far as the eye can see. To the southward, beyond the wooded slopes of Chantry Downs, is seen St. Martha's Hill, on the top of which, looking majestic in its solitude, stands St. Martha's Chapel, a Norman structure of great interest, erected on the supposed scene of some early martyrdom. The church is dedicated to St. Thomas of Canterbury and all Holy Martyrs, and was a chantry for the use of pilgrims wending their way to Canterbury. Because of its lofty situation a fire pan was fixed on the tower in days gone by to give notice of approaching danger. The church was restored and prepared for public worship in the year 1848.

In the surrounding valleys are noticed houses dotted here and there, with occasionally a spire peeping out from among the trees, while on the summit of the hill on which we stand is seen the Semaphore House. This is now a private residence, but was one of the lines of semaphores between London and Portsmouth. The land adjoining the lane which runs at the side of this house belongs to the War Department, who have constructed a fort thereon, which from its position is well situated to check the advance upon London of an enemy from the south coast of England. In the adjoining field it is said the inhabitants watched the burning of Old St. Paul's in 1666. Below us the river Wey winds serpent-like through the meadows at the foot of the hill, and on the opposite bank stands St Catherine's Hill, with its ruined chapel standing out in bold relief against the foliage of the hill behind, on top of which can be seen Booker's Tower on Guildown and the gravestones of Guildford Cemetary peeping out in strong contrast to the green turf. The charming surroundings seem to impress on one the thought that it would be preferable to be buried in Guildford than to be alive in some towns that one could mention.

Returning to the town itself, we find it dates back to Saxon times, and that in the year A.D. 900 "it was a Royal manor, and was bequeathed by King Alfred to Ethelwald, his nephew, at whose death or rebellion it again became the property of the Crown." Some authorities, however, claim it was a place of importance in Roman times, and that it was the site of Noviomagus, the chief of the Regni. The most ancient building existing at present is the old castle keep, which, with the exception of a few walls, is all that remains of the ancient building. The date of its erection is unknown. The keep is well elevated (this was necessary for its possible use as a fortress), and stands on what is probably an artificial mound. Its dimensions are about 45ft. by 47ft., and its height is 70ft. The walls are 10ft. thick in parts, and are built of ragstone flints and Roman bricks, some of the courses being in herring-bone work. The roof, it appears, was removed about 1630, as it was much decayed. There are no windows till we reach the upper floors, to which there is one large window on each side. A stone archway in the west front is claimed to have been an entrance doorway. This is at a considerable height, and must have been approached by a staircase on the outside of the wall, which is not uncommon in buildings of this class.

The old castle has been frequently visited by kings and other Royal personages. It has also served as a prison and torture chamber to others less fortunate. The town was associated with the terrible massacre of the Norman followers of Prince Alfred by Earl Godwin in 1036, many of whom were lodged in Guildford Castle. That such exciting scenes were rare in Guildford, which was essentially a town of peace, is shown by Clark in his "Mediæval Military Architecture," in which he says: "Though of great age, neither the town nor the castle has played any great part in English history. The town was never walled, the castle never stood a seige. No considerable battle was ever witnessed from its towers. No Parliament or great council was ever held within its hall. Though always a Royal manor and long maintained as a Royal residence, it was used also as a prison, and it is but rarely mentioned either in the records or by chroniclers. The castle was not garrisoned in the great Civil War, and so escaped being dismantled by either King or Parliament. Its state of decay is due to the effects of time, powerfully aided by the local greed for building materials."

This latter statement is no doubt true, as the present High Street is said to have been built of old materials taken from the castle. King Henry II. spent his Christmas in the castle in 1186; King John in 1201; King Edward in 1339; an dseveral succeeding monarchs down to the time of Queen Elizabeth have done the same. In 1611 it was granted by King James I. to Francis Carter, of Guildford, and it remained vested in his descendents until it was purchased some time back by the Duke of Norfolk, and afterwards became the property of Lord Grantley. In 1885 the site was purchased by the Guildford Corporation, who laid out the grounds and bowling green as a pleasure garden. A brass tablet erected in the grounds states that: "The site of the ancient castle of Guildford, together with the adjacent bowling green, was in the year 1885 purchased by the Town Council of the Borough of Guildford from the Right Honourable John Brinsley, Lord Grantley, for the sum of £4,490, and a further sum of £2 500 was expended in laying out the estate as public pleasure grounds. Towards this expenditure a sum of £1,000 was generously given by the Right Honourable Geo. Cubitt, M.P., for many years one of the members of Parliament for the Western Division of this County, and the balance was raised by loans contracted on security of the general district rates of the town. On Coronation Day, 28th June, 1888, the grounds were formally declared open by William Swayne, Esq., J.P., mayor, and they are dedicated to the use of the public for ever." This was a wise step, as, in addition to the natural beauty of the spot, it has been further improved by laying out the old bowling green as a terrace, and forming flower beds, a fountain, rustic bridge, and fish pond, making it a promenade of great beauty, cut off from the noise and bustle of the streets. At the Quarry Street entrance stands the old Castle archway, which formerly had a portcullis with this date, "J. C. 1669," built by John, the grandson of Francis Carter the grantee. The old house adjoining, shown in the sketch on page 1, which had been occupied by the late tenant, Miss Duncombe, for about forty years prior to her death in 1897, has been thoroughly renovated, and is now used as a museum by the Surrey Archæological Society. Needless to say, the excellent old chalk fire-place, shown in my drawing, has been retained, also the old entrance door, which has been freed of its suc-

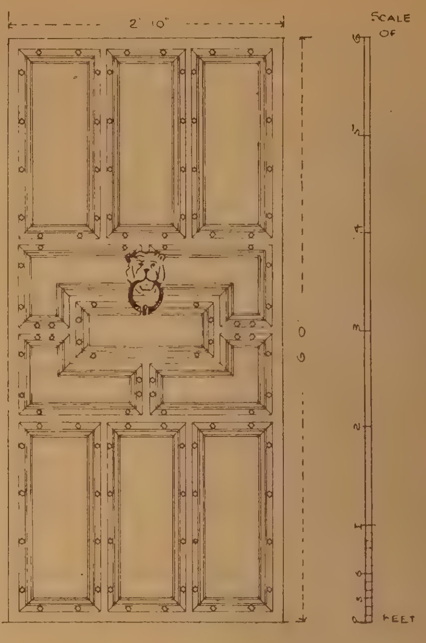


ARCHBISHOP ABBOT'S HOSPITAL, GUILDFORD.

cessive coats of paint, and prepared to withstand the decay of future years. Perhaps the most interesting building, architecturally, is the Town Hall, and the first to attract one's attention on going up the High Street because of its projecting clock, said to be one of the finest in England. The building is of brick, faced with woodwork, and was erected by subscription in the year 1683, and replaced an earlier building which stood "across the street."

The building from the first floor level overhangs the pavement and is supported by four "grotesque" brackets. The gable end is surmounted by an open hexagonal bell turret with a wooden balustrade and lead cheeks, and roof with a weather vane. The bell fixed in the turret is said to have been brought from St. Martha's Church, Chilworth, and on it the clock strikes the hours. The main front windows are of lead lights, and open on a balcony with a wrought iron balustrade. The clock, which is a very fine one, was given by Mr. John Aylward in 1683 in return for his freedom. At this time the trade of the town was strictly governed by the town Guild (Gilda Mercatoria). No one was allowed to set up in business who did not belong to the Guild. Aylward was not a member or able to purchase his freedom. So, in conjunction with his sons, he made this clock and presented it to the town, and was given the freedom of the town in return. As a proof of the workmanship it is only necessary to state the clock has gone ever since, requiring very little repair. The wrought iron stays to this clock are of excellent design and well worth sketching. They were made locally. In the building are held the Borough and Petty Sessions and County Court, and the Council Chamber is situated over the southern portion of the building, with windows opening on to the front balcony. The latter room is in oak wainscoting, and contains a fine old chimney-piece in stone, brought from an old mansion called Stoughton House, in the parish of Stoke. In this chamber is a picture of Sir Richard Onslow receiving the Dutch flag after the victory of Camperdown in 1797, painted by John Russel, R.A., a native of the town, and also a portrait of the Right Hon. Arthur Onslow, who held the office of Speaker in the House of Commons during the reign of George II. The Onslows have been closely connected with the town of Guildford, and "Speaker" Onslow received his education in the Guildford Grammar School. The walls of the hall in which the County Court is held are decorated with the town arms, and some fine pictures by Sir Peter Lely. The town possesses plate of great interest, and two maces, the smaller of which is said to be the oldest in the kingdom, its date being approximately about the middle of the fifteenth century. The Mayor's staff was presented to Guildford by Queen Elizabeth, while the Mayor's gold chain was given in 1673 by Arthur Onslow, Esq., then High Steward.

On the same side of High Street as the Town Hall, and slightly higher up stands Abbot's Hospital, a red brick building erected in 1619 by Archbishop Abbot, who was a Guildford man, educated in Guildford Grammar School. He afterwards rose to be Archbishop of Canterbury. The street front has a fine central quadrangular tower, with octagonal turrets at the corners, while at each end project gabled wings. The main entrance archway is of stone, while the massive entrance doors are of oak, panelled and decorated with the Archbishop's coat of arms. This entrance leads to the quadrangle, to the west of which are allocated the brethrens' quarters, the sisters' quarters being to the east. The founder's rules required that the inmates should be unmarried persons not less than sixty years of age. The brethren and sisters are elected by the Governors, consisting of nine officials, including the Mayor, and four non-official governors, gentlemen resident in or near the town. There are at present residing in the hospital, twelve sisters, two nurses, ten brethren, and the master of the hospital. The inmates receive eight shillings a week in addition to lodging and firing. On the north-east end of the quadrangle is situated the chapel. The two Gothic windows in this chapel contain some very fine stained glass depicting events in the lives of Jacob and Esau.



FROM OLD HOUSE, CASTLE ARCH, GUILDFORD. MEASURED AND DRAWN BY SYDNEY NEWCOMBE.

THE "ANGEL" YARD, GUILDFORD. SKETCHED BY SYDNEY NEWCOMBE.

Through the archway in the north side of the quadrangle we get to the garden, which is spacious and well kept, and doubtless sufficient for all needs. A drawing of the door in the garden front is given on page 6. Next to the chapel in this block is the dining hall, with a fine stone and wood fireplace and oak furniture. The inmates rarely use this hall now, as they partake of their meals in their own apartments. On the first floor above this room is the library. The carved oak mantelpiece, with its grotesque figures, is characteristic of the period. The panelling around the room and the furniture is of oak, and very substantial in character. The door to this apartment is very massive, as will be seen by reference to the drawing, as also is all the woodwork in this building. The master has a fine suite of apartments, and the staircase and Board room are worth seeing. There are some excellent examples of rubbed brick chimneys, reminding one of those at Hampton Court, and the lead rain-water heads are good in design. The Duke of Monmouth was lodged in the tower of the hospital while on his way to London after his defeat at Sedgemoor.

Guildford has had several charters granted it, the first and second from Henry III., and it has also had three distinct religious houses—the Dominican Friars, the Carmelites or White Friars, and the Crutched or Red Friars. Of the first establishment nothing remains to mark its site, though it was, in its time, of great importance. Of the second establishment there remain two crypts, with groined roofs supported by a circular column, one being under the Angel Hotel, High Street, and the other under a building immediately opposite; these are now used as stores. This friary was dedicated to St. Michael and All Angels, and from this the inn probably derived its name. On this spot stood the Fish Cross, erected in 1345, and in 1598 a wooden house was erected on the same spot to serve as a fish market. The Rectory House for Holy Trinity and St. Mary's parishes, once known as Poyle House, was the home of the Crutched Friars.

Of the churches, the most interesting is St. Mary's Church, situate in Quarry Street. It was probably started in the reign of King Stephen, when the tower and aisles were built by the Testard family for the use of their tenants. William the Conqueror had granted a portion of the Crown lands on the east bank of the river to the Testard family. St. Mary's Church consists of a nave with aisles and a chancel and two side chapels, dedicated to St. John the Baptist and St. Mary. In the former are several fresco drawings attributed to William of Florence, probably because he had been employed by King Henry III. to retouch the paintings in Guildford Castle. The aisles have several grotesque corbels of an early date. The church underwent a complete restoration in 1863. The Holy Trinity Church in High Street is a comparatively modern structure, replacing the old church, which had been built by a branch of the Testard family. Pepys visited this church on August 6th, 1668, and makes the following reference in his diary: "At Gilford we dined; and I showed them the hospitall there of Bishop Abbotts and his tomb in the church, which, and the rest of the tombs there, are kept mighty neat and clean with curtains before them." Owing to some repairs having been executed, and some arches and pillars removed, the structure was weakened causing the steeple to fall in with a sudden crash in 1740. Some of the old memorials were destroyed, but fortunately some were uninjured, including the monument to Archbishop Abbot. There is also a fine monument to the Right Hon. Arthur Onslow, Speaker to the House of Commons, before referred to.

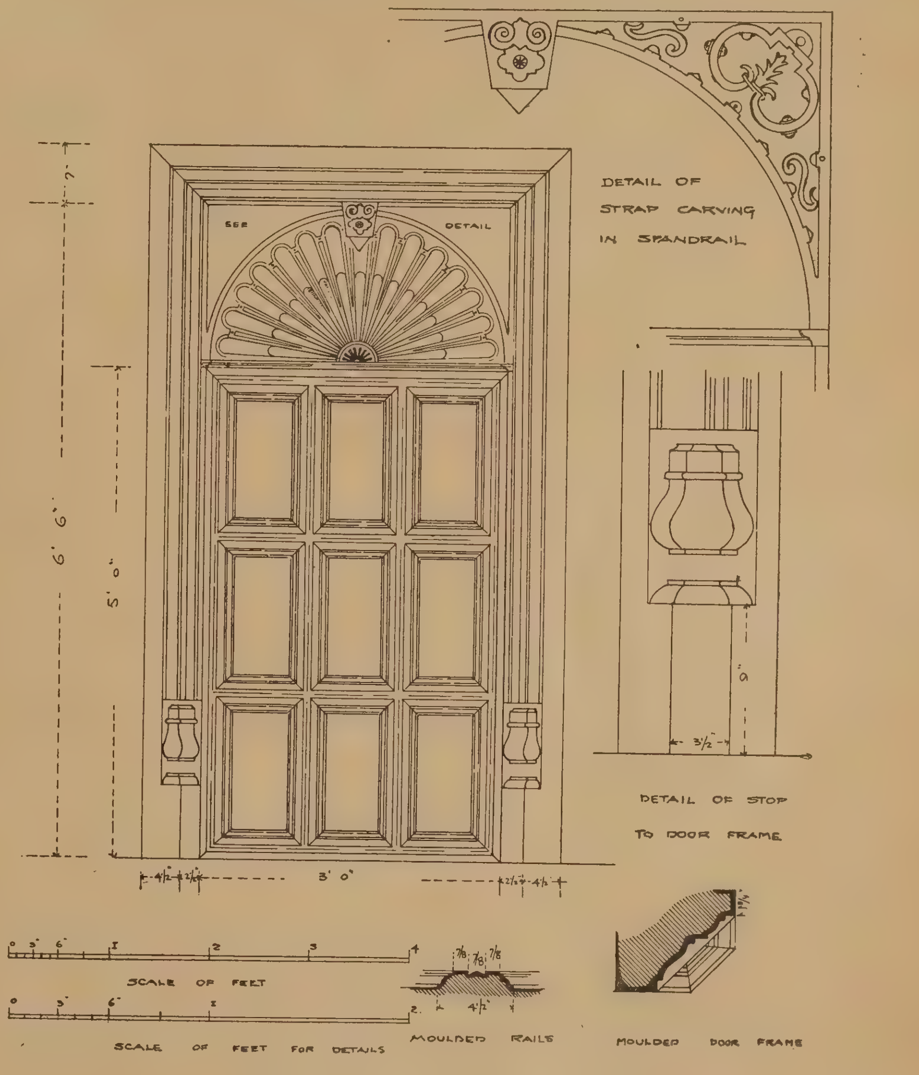
St. Nicholas Church, situate near the Town Bridge, is a modern structure built in 1875 from designs by Mr. Ewan Christian. This is the third church which has been erected on this site. There are a great number of old domestic and business premises in the town, most of which are charmingly simple and quaint in design, and shine conspicuously against the modern work which here, as in most towns, cannot compare in point of beauty with the old. There is, however, some good modern work. Two buildings at least of those I saw were far above the average work of to-day. I refer to the Hillier Almshouses in the Farnham Road, built on land given by the Earl of Onslow, from designs by Messrs. Ernest George and Peto, and Wycliffe Buildings in the Portsmouth Road, which are simple and quaint enough to remind one of Mr. Voysey's work, with overhanging eaves on wrought iron brackets and plastered dormers. There are many other buildings and items of interest to the architect and antiquarian, but for details of these and a fuller description of the beauties of the neighbourhood I cannot do better than refer the reader to the researches of Mr. G. C. Williamson, Mr. E. A. Judges, and others, to whose excellent works on the subject I am greatly indebted for much of the information contained in this article.

Cardiff New Town Hall.—At Cardiff Town Hall a Local Government Board inquiry was held respecting the application of the Cardiff Town Council for sanction to borrow a further £33,000 for the erection of a new town hall and law courts, and £3,800 for the provision of a depôt at Harrowby Street. The inquiry was conducted on behalf of the Local Government Board by Mr. W. A. Ducat. The £33,000 now applied for is an additional sum to the £200,000 borrowed under powers of the Cardiff Corporation Act of 1898 for the erection of a new town hall. The extra expenditure has been necessitated chiefly through the project to raise the height of the façade all round and the provision of sundry conveniences for the different staffs.

ROYAL ARCHÆOLOGICAL INSTITUTE.

SUMMER GATHERING AT IPSWICH.

Following the annual business meeting of the Institute, which was held, as reported in our last issue, at the Town Hall, Ipswich, on Friday, the 28th July, a paper on "Orford Castle" was read by Mr. V. B. Redstone. Many of the historical facts referred to in the paper had up to that time, said Mr. Redstone, been concealed in the archives of the county ever since the first stone of the Castle was laid. In the Pipe Rolls, he had found the whole story of its erection. After touching upon the facts that the hamlet of Sudburnham, as it was called, was in the "Honour" of Eye, and that this "Honour" was held by Thomas à Becket from 1154 to 1163, Mr. Redstone showed by means of a rough map that the reason which induced the King (Henry II.) to build Orford Castle was to provide a means of coast defence, in order to check the constant landing of hired troops from Flanders, who came over to support the Earl of Leicester, and his ally, Roger Bigod, who held in his possession all the then-existing castles of Suffolk which commanded the sea coast. This Roger Bigod is still, in these parts, Mr. Redstone maintained, the headless horseman of the untutored rustic. Between his Ipswich Castle and his castle of Framlingham, there were many lanes down which he nightly rode, according to tradition, and along which, when he was in the flesh, he did actually lead his troops of mercenaries.



ARCHBISHOP ABBOT'S HOSPITAL, GUILDFORD (A.D. 1619): DOOR IN DINING-ROOM. MEASURED AND DRAWN BY SYDNEY NEWCOMBE.

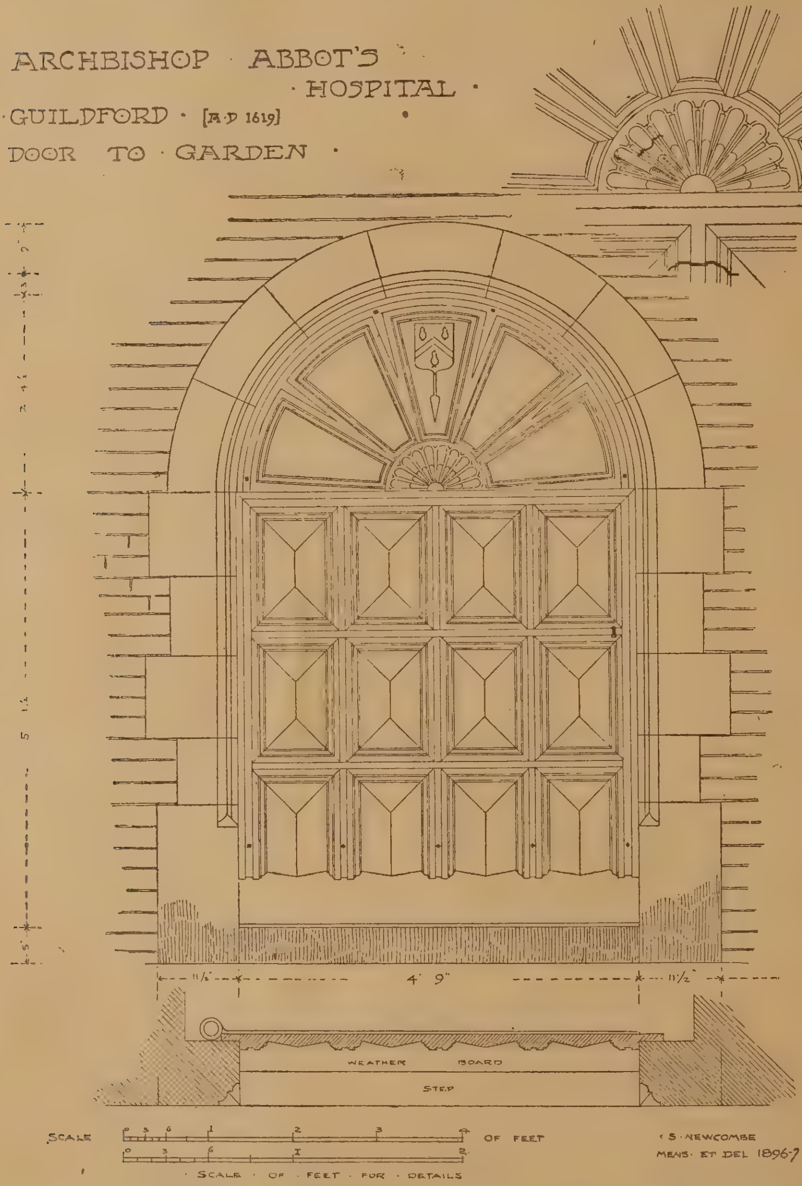
The Castle at Orford was begun in 1165. The earliest work undertaken was the construction of a road and the erection of a mill. It was obvious that a road was required to facilitate the conveyance of stones from the sea-shore and of timber from inland.

The walls were mainly built of materials furnished by the rocks of the neighbourhood, with a skin of Caen stone. The supervision of the work was given to Bartholomew Glanvil, Robert de Valeins (his son-in-law), and Wimar, the future Vicar of Orford, then chaplain. In the Pipe Rolls, Mr. Redstone found a return of the expenditure on the work, drawn up by Oger, the Steward of the "Honour" and Constable of Eye Castle. Similar accounts for the following years are preserved, and these were kept with such exactness as to show a fine of fivepence which was inflicted upon a workman for neglect or bad work. Amongst those employed were two "Normans of Ipswich." The probability was that these men were skilled surveyors, because they were called in at the commencement, when the ground was prepared as a site for the castle, and again in 1170, when a great marsh was reclaimed and made fit for the herding of sheep. This marsh and others are still known as "King's Marshes." Touching upon the tragic murder of Thomas à Becket, Mr. Redstone said that this prelate was greatly honoured and revered in the county of Suffolk. An altar was dedicated to him in most of the churches, especially in the churches of the "Honour" of Eye; that in Orford Church was so dedicated until just prior to the Reformation, when, by a mandate of Henry VIII., such veneration was ordered to be done away with.

The quarrel with Becket was brought to a close at the prelate's murder in 1170, but a storm far more dangerous to Henry's power had been gathering both at home and in France. A rebellion broke out in 1173, and the Earl of Leicester, with his wife and a large force of Flemings, landed in Norfolk, and were welcomed by Hugh Bigod, who had received the promise of extensive honours from the King of France if the rebellion should prove successful. Bigod held all the castles of Suffolk, except Orford, which was in this contingency garrisoned and put into a state of defence. A large and deep fosse was dug around; a strong kind of wattled fence, strengthened with timber, was set up between the fosse and the keep; and wooden towers were erected to protect the stone bridge thrown across the moss. The services of the Normans of Ipswich were again requisitioned to carry out this work, the total cost of which was £52 2s. 8d. A garrison of seventy-five men was placed within the castle, and provisions were collected to enable it to withstand a long siege. The purchases were recorded of 200 "seams" of wheat, according to Ipswich measure, at £21 13s. 4d., of 100 pigs at 2s. each, and 500 cheeses at 2d. each, together with iron, rope, and small cord, three hand-mills, and charcoal. The Flemings attacked the convoy guarding these provisions, but were only successful in carrying off four-fifths of the charcoal; and they also attacked the castle, but did little more than destroy the two towers, which the handy Normans repaired at a cost of about £12.

Meanwhile, Norwich Castle was safely held for the King also, whilst William, Count of Flanders, was with Bigod, now at Bungay and now at Framlingham. When Bigod saw that the contest was hopeless he made his submission to the King at Syleham. In considering the history of the castle, Mr. Redstone went on to say there was a local tradition, of which he was a little sceptical, namely, that whilst the sea had destroyed other towns on the Suffolk coast, it had deserted Orford. He could not reconcile this with the constantly repeated fact, chronicled in the Pipe Rolls, of devastations made by the inroads of the sea, and the destruction thereby of the mills belonging to the castle.

In 1336 the castle was granted to Robert de Ufford, and after that date it was no longer a fort, but was used as the residence of the Lord of the Manor. Its fortunes may be traced with those of the Uffords, the Willoughbys, and their descendants. The present owner of the castle (Mr. A. H. E. Wood), it was added, is a member of the Suffolk Institute of Archæology, and has recently responded to an appeal to place in repair a part which, if it had been allowed to fall into ruins, would have speedily caused the destruction of the whole fabric.



ARCHBISHOP ABBOT'S HOSPITAL, GUILDFORD: DOOR TO GARDEN. MEASURED AND DRAWN BY SYDNEY NEWCOMBE. (*See p. 4.*)

On the following day (Saturday) a visit was paid to the castle which formed the subject of the above paper, and further details with regard to the structure of the building were given on the spot by Mr. St. John Hope.

The keep of the Castle, it was stated, which is the one part left standing, differs from most others in shape—instead of being rectangular, with corner turrets, it is circular within and polygonal without, with three large towers or bastions stuck on round the outer circumference. The main body of the keep is divided into two storeys standing on a basement. In the basement there is a well; immediately upon entering the building the remains of what was formerly a chapel can be seen, with the stone on which the altar once stood; the first large room once formed the barracks, or the place where the soldiers lived, and the fine apartment above it was the constable's or governor's apartment.

After inspecting the castle a visit was paid to the church, where Mr. Micklethwaite, under whose directions the building is being restored, gave an interesting address. He said that when he saw the church some time ago it was practically a ruin, insomuch that it was seriously proposed to abandon it altogether, and build a new church for the use of the parishioners. Fortunately the rector opposed this idea, and sufficient money had been raised to put a roof upon the edifice and proceed with other work. He did not think that anything was known really of the origin of the church. The parish church of Sudbourne was some distance away; a town grew up around the port; no doubt it became necessary to make further accommodation, and this was done, not by creating a new parish, but by the erection of a chapel-of-ease. Mr. Micklethwaite went on to relate the history of the church, so far as it is known, and to point out the objects of special interest. With regard to the tower, which presents such a singular appearance with the upper part entirely gone, he said the people thought it was dangerous many years ago, and began to pull it down. When they found it to be such hard work, they gave the job up, but, unfortunately, they did not leave the place properly protected, and the rest of the upper part fell down in 1829.

Later in the day a visit was paid to Butley Priory, where an explanatory lecture was given by Mr. St. John Hope.

On Monday, the 31st, an excursion was made to Clare Abbey and Clare Castle; Mr. Hope again acting as guide. The church at this place, a very fine edifice, was afterwards visited. The tower is in process of restoration, under the care of Mr. Tettmar Blow, architect to the Society for the Preservation of Ancient Buildings. A descriptive statement was given by Mr. Micklethwaite; Mr. J. S. Corder, of Ipswich, in proof of the former magnificence of the church, said that Will Dowsing, of the Commonwealth period, reported that he "brake down a thousand superstitious pictures," two hundred of them with his own hand; and the Rev. Dr. Cox directed attention to the church plate, more especially to an elaborate chalice, supposed to be of Flemish workmanship, which is considered a great curiosity.

After luncheon an excursion was made, by special train, to Long Melford. From the station carriages were taken to Kentwell Hall. The old Elizabethan mansion of this name is situated not far beyond the famous church of Long Melford, and is approached from the high road through an avenue of lime trees nearly a mile in length, which is said to be the finest in all England. In regard to the house itself, Mr. J. S. Corder pointed out that the plan took the outline of three sides of a quadrangle—a style which was adopted after it became unnecessary to build fortified houses. The structure is surrounded by a moat, spanned by two bridges, while a second moat encloses the pleasure grounds, as at Helmingham. The founder of the house was Thomas Clopton, who died about 1597. Mr. Corder traced briefly the fortunes of this family, to whom Long Melford Church owes much of its grandeur.

At Long Melford Church, which was next visited, the visitors were received by the Rev. G. St. John Topham. Mr. Micklethwaite said that this was the finest church they had seen during their visit to East Anglia. It took about fifty years to build—a period which was nearly, but not quite, coincident with the last half of the fifteenth century. The church was not only built in a very grand and expensive sort of way, but furnished with equal magnificence. The Clopton Chapel was said by Mr. Micklethwaite to be one of the most remarkable that could be found in any English church.—Mr. Brabrooke, C.B., gave an account of the effigies in the windows. Some amongst them represented, he said, the old Sergeants-at-Law in their parti-coloured robes. "Sergeants" of this kind were no longer created, and almost the only pictures of what they were like in full costume were presented in these windows.

In the evening a general meeting of members was held at the Town Hall, the president, Sir Henry Howorth, in the chair. In his introductory speech, the chairman said the members of the Institute had had an excellent and most enjoyable meeting, and were very grateful for the welcome which had been extended to them by local residents. Some of them would go away with the feeling, however, that in a county so full of archæological treasures, it was a pity there should be so little genuine archæological work on the part of the gentry of the neighbourhood. They hoped very much indeed that one result of their visit to Suffolk would be to give a stimulus to such work. The Royal Archæological Society was one which inherited great traditions; their particular mission was the evangelisation of archæological inquiry, in respect to the encouragement of local societies; and he did not hesitate to point out that some changes in their methods of carrying out the work might be made with good results. He contended that it was desirable to call upon local men to give an account of buildings or other objects of interest before hearing the views of their own learned pundits, and that, disregarding the temptations to mere "picnicing," they must endeavour to maintain their reputation as a learned society.

Several new members were nominated and elected, and the remainder of the meeting was devoted to the passing of votes of thanks to various ladies and gentlemen who had helped in different ways to render the annual meetings interesting and successful.

On Tuesday, August 1st, the final excursion took place to Hadleigh and the neighbourhood. At Hadleigh Church, Rev. Dr. Cox acted as guide. Dr. Cox spoke at some length of the age of the building, as it is revealed in various features. Although the church is very large, it is not the largest in Suffolk, as was sometimes said. St. Mary's, at Bury St. Edmund's, is larger, as is also the church at Long Melford, which they had seen on the previous day. The tower and spire are 150ft. high. The spire put the Rev. Doctor in mind of that at Chesterfield Church, and he contended that spires were not sham or insecure ornaments, but legitimate elaborations of the roofs of church towers. After referring to the curiously reticulated form of the headwork of the spire, Dr. Cox said it was wonderful to note the lovely silvery grey "tone" of colour which this part of the church had assumed. Visits were next paid to Gifford's Hall and to Little Wenham, where there is a ruined church of remarkable interest. Mr. Micklethwaite said it was an almost unaltered thirteenth century church, the most interesting that they had seen during the meeting. After considerable discussion—in which the speakers were Sir H. Howorth, Chancellor Fergusson of Carlisle, Dr. Cresswell, Sir Francis Boileau, Mr. Fox, and the Rev. Mr. Bartlett, of Gloucester—a resolution was passed that a message should be sent to the clergyman, the patron of the living, and the Bishop of the Diocese, urging in respectful words that such an edifice should be maintained in decent repair. Little Wenham Hall was then visited, and declared to be no less remarkable than the church. A pleasant drive back to Ipswich brought to a close the programme of the annual meetings for 1899. The general verdict of those who took part in them was that the meetings and excursions have been this year of an exceptionally interesting character.

RIGHTS OF LIGHT AND AIR*

By T. WALTER L. EMDEN,

(*President of the Society of Architects.*)

A VERY practical work, and one of the first importance, which is being undertaken by the Society of Architects, is that of bringing about some change in the law which (without affecting the rights of property) shall prevent the vast waste of time and money, which there is every year in negotiating and litigating over questions of light and air. Every architect and surveyor knows well the annoyance which his client often suffers when proposing to erect buildings. It is no exaggeration to say that in some cases a building, the erection of which may greatly improve the surrounding property, is attacked on all sides by questions of light and air, and that a crop of ten or a dozen cases may be raised against it; many of them often of the most trivial nature, and it must be an especially lucky building owner, who commences and completes his building without any such claim being made. Almost all of these cases arise from, or are encouraged by, the uncertainty as to what does or does not constitute the legitimate rights of an adjoining owner, and I am afraid it is only the truth to say that the desire of gain largely affects the claims made. And the fear of being stayed by an injunction and the risk of large costs in fighting an action induce the building owner to pay sums of money far larger than the damage warrants. Look for an instance at what has to be faced by the latter, and it will be seen at once that the risks must often enough curtail building enterprise, and seriously impede those who legitimately wish to rebuild. Everyone seems to think that a building owner is

Fair Game for Compensation.

It is only natural that each surveyor should desire to look first to his client's interest; and the state of uncertainty as to what are, or what are not, a client's exact rights, tends to prevent a settlement and produce a lawsuit. The same thing affects the solicitors when they come on the scene, and consequently not only dò the professional costs get piled up by further expert evidence being called in, but the law's uncertainty makes litigation almost inevitable. In order therefore to protect the interests of a client an injunction is obtained, and I fail to see that the architect or solicitor can be blamed if he takes this step where the case may be of a trivial character, even if he thinks his client is likely to obtain a monetary benefit by so doing, larger than the real value of the damage. These cases, too, depend so much on

Technicalities,

while the necessity to bring home to judge and jury the facts as they are, is so great, that models and numberless plans have to be prepared, and experts at expensive rates are called in order to prove fully the views of each side to those who have to try and decide the case. What wonder is it then that these cases become enormously expensive, and thousands of pounds are every year more or less wasted in costs; this very expense is the opportunity of the man with small rights to obtain from the building owner a large sum of money, which he would rather pay than try the case with its attendant risks of costs and delays. I venture to think that no inquiry into this subject could be made, without disclosing not only the great number of these actions, but their wasteful cost and the trivial character of the majority. I am sure that every honourable professional man is desirous of avoiding this useless waste of money and of preventing blackmailing opportunities. The Council of this Society has set to work to make a determined effort in the direction of preventing this useless waste, which affects not only the public, but the honour of professional men. There is no doubt the question is a difficult one to deal with when first approached, because it is not desirable that vested interest and the rights of property should be interfered with; but it seems to me that the object which we have in view can be obtained without any such interference, and the waste which has been and is a growing evil justly and effectively prevented. In Scotland, the Court of the Dean of Guild deals with these questions, and the canny Scot is saved much annoyance and expense; and, conservative as we may be in England, there can surely be no reason why we should not adopt some similar or suitable means to accomplish the same end here. The Building Act Tribunal, in dealing with Building Act cases in London, has shown that there can be no difficulty in appointing a Technical Court to deal with these matters; and the payment of its cost would be the merest fraction of the costs to which the building owners are now put. The secret of this

Wasteful and Improper System

lies, like all other wasteful systems, in its uncertainty, and until this can be decided before commencing to build by an independent decision from a court tò which it is compulsory to go as in Scotland, the evil will grow and discredit our ability as business-like and honourable men. The suggestion which I would make, and which I think this meeting should adopt, is that a Technical Court under the London County Council in London should be established, and every building owner should be compelled to deposit a full set of the plans of any new building or material alteration of an existing building with the authority, paying such fee as may be deemed necessary, and that the authority should then require the

Owner to Give Notice

to all the adjoining owners who may be affected. Then the Tribunal or Local Authority should proceed to hear the objectors and the building owner, and, after hearing, decide as to what height, &c., the building can be carried without interference with the lights and easements of the objectors. The fact that such a decision was given before building operations were commenced and before the building owner was pledged to his contract with his builder, would of itself be a substantial boon, apart from the great saving of time and money, and the absolute prevention of blackmailing by factious and petty cases being raised. I fail to see that anyone could suffer injury by this course, and the good arising from it, I think I have shown, must undoubtedly prove a valuable saving to the public and a help to the professional man in building operations. There is no doubt that when cases are carried on men's feelings and judgment get involved and warped, and cases are carried, in consequence, to such lengths that thousands, as I have said, are spent on small and petty matters, which in themselves, taken at the very largest valuation, would not represent more than a tithe of the costs which are incurred. I in no way wish to pledge myself or the Society of Architects to the details or the exact methods by which this beneficial change should be brought about, but I suggest what seems to me a simple means, that is, an extension of the powers of

The Building Act Tribunal

in London, and by giving power to the provincial local authorities, to appoint a similar tribunal. The fees charged could be made to cover all the expense of the court and its attendant officers, and would then be moderate enough to prove a mere drop in the ocean, compared to the present wasteful process. Future discussion on this subject may devise better means, but anyway it is in my opinion, and I trust in the opinion of all those to whom I speak, necessary that the settlement of this subject should not be longer delayed, and that the remedy should be applied at an early date. The Society have presented a petition to the Lord Chancellor, and I have also laid before the London County Council a notice of motion for the Building Act Committee to consider this important question. One difficulty is that the question does not appeal directly to the great body of the public who, though they may suffer in certain ways, only suffer occasionally and for the most part indirectly; but those who build and have built will, I am sure, feel the necessity for the remedy which we advocate, and I trust they will use also their best endeavours to bring it about. I trust, too, that the efforts of leading men, both architects and surveyors, as well as those of the Legal Profession, will not be wanting in the necessary effort to bring about a reform so greatly needed, a reform which will once and for all sweep on one side the exaggeration of claims of a petty and improper character with all the attendant waste of clients' money which comes in its train, and protect more thoroughly from infringement, legitimate rights of light, air, and other easements.

---

* A paper read at a meeting of the Society of Architects, held at Sheffield, on June 30th, 1899.

Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor.

RIGHTS OF LIGHT.

To the Editor of The Builders' Journal.

Hove.

Sir,—Referring to your issues of July 5th, and July 19th, re Rights of Light. Does a conservatory (with a glass panel door from a room of a dwelling house) extending the whole side of a house and half-way up, constitute an "ancient light?" There are windows at side of house. The land adjoining was purchased as building land.—Yours, &c.,

CONSERVATIVE.

The answer is in the affirmative.—H.P.B.

SURVEYORS' INSTITUTE EXAMINATION PAPERS.

To the Editor of The Builders' Journal.

Skipton.

Dear Sir,—Can any of your readers let me have a copy of this year's Students' Preliminary Surveyors' Institute examination papers? Thanking you in anticipation,—Yours truly, STUDENT.

"Student" should apply to the secretary of the Surveyors' Institute for particulars of the examination and also for the papers. Failing this, the secretary would probably furnish him with a list of this year's students, to one of whom he might write for the papers.

A SADDLE-BACK BOILER.

To the Editor of The Builders' Journal.

Burnley.

Sir,—I am about to lay down a boiler for hot-water heating, and am strongly advised to select one which, although a saddle, stands on feet, and has a firebox and return flue. The chimney is carried over the boiler so as to have the boiler enveloped from under the edges in addition to the flues. I have tried to ascertain the makers, so far unsuccessfully, and in my extremity apply to you. The one known was at Swansea, and was used by my adviser.—Yours, &c., J. R. L.

We think you would have to order specially the boiler you mention. We have never come across one at work, although they have been described to us about six or seven years ago as powerful, economical, and durable. Against these advantages had to be set the greater skill required in setting, and the need of cleaning-holes at the back feet, which latter point is not always easy to obtain in the heating chamber provided. The boiler had to project from one wall only. A similar boiler, though not as good, can be arranged by placing bricks at the corners of an ordinary saddle-boiler with a single fire flue. Such a boiler would need more frequent cleaning, as there is no pocket for the sediment to collect in. The idea is old, we believe, but we do not think it has ever been patented.—O. W.

SOLUBLE GLASS AND DELPH STONE.

To the Editor of The Builders' Journal.

Richmond.

Sir,—Can you tell me what Soluble Glass is, and where I could obtain it? Can you give me information about Delph Stone? Is it suitable for rubble or ashlar?—Yours, &c.,

T. H. S.

Soluble glass is silicate of sodium. It should be obtainable at the nearest pharmacy or drug stores; but if wanted in wholesale quantities it may be had from Wright, Layman, and Umney, Southwark Street, London, E.C. We have never come across any Delph stone (probably a local stone) so cannot say anything of its quality; but any stone that is *stone* should be suitable for rubble or ashlar work.

H. E.

PERSPECTIVES AND SPECIFICATIONS.

To the Editor of The Builders' Journal.

Manchester.

Dear Sir,—Will you kindly inform me how I can learn to ink in perspectives, and also how to learn to write a specification. I may tell you that I have taken in your valuable journal since No. 1, and I have derived a good deal of benefit from it.—Yours truly, P. C.

The information on perspectives which you require can be obtained from Middleton's "Linear Perspective," price 1s., published by B. T. Batsford, 94, High Holborn, London. For full information with regard to the preparation of specifications obtain a copy of "Specification," price 5s., published at the offices of the Builders' Journal and Architectural Record.

SOUND PROOFING ARRANGEMENT.

To the Editor of The Builders' Journal.

London, N.

Dear Sir, — Would you kindly let me know the best treatment for preventing sounds through floors of flats. I have recently erected some and pugged joists with three inches of lime and hair, but the sounds through ceilings are very apparent and objectionable; the above refers to ordinary floors. In others I have done I have used steel joists and concrete, and laid floors on 3in. by 2in. across steel joists, but you can still hear one walking across floors above; I made sure that the 6in. of concrete would have prevented this. —Yours truly, NORTH LONDON.

It is practically impossible to prevent the passage of absolutely *all* sound through floors, as the "sound" of people walking overhead consists really, in part, of vibration. It would be less noticeable if the floors were made hollow, the ceiling being thick and impervious to sound. The supporting joists should be deeper that the concrete by several inches, so that the ceiling being carried on the bottom flange would naturally leave a good non-conducting air space. G. A. T. M.

FINISHING HALF-TIMBERED WORK.

To the Editor of The Builders' Journal.

Manchester.

Sir,—I should be much obliged by your kind replies to the following questions:—(1) What would be a good and effective *black* preservative material for painting half-timbered work, which is to be of oak or pitchpine. How many coats will be required, and how applied? (2) What is the most durable white cement in the market for filling in between half-timbered work. It will require to resist the atmospheric conditions of a smoky, damp, Lancashire town? Also to retain its colour for a reasonable length of time before requiring renovating. (3) Would a rough cast filling to half-timbered work composed of one part Portland cement, to two parts sand, finished with Derbyshire spar chippings, be as effective architecturally as the usual white finish?—Yours, &c., Q.

(1) For a black preservative compound a substance generally known as tar varnish, and retailed at about 1s. per gallon, would probably meet the querist's needs. This could be applied with a rough paint brush, and to prevent a glossy finish it might be diluted as required with turpentine. For a brown tone Stockholm tar could be used, or the timber might be coated with boiled oil toned with a little burnt umber. (2) Generally speaking none of the white cements on the market are suitable for outdoor use, and the querist wil probably best gain his end by executing the rough cast in Portland cement or seleniti lime, and afterwards treating it as often a necessary with a white washable distemper "Petrifite" might, perhaps, answer the purpose. (3) There is no reason why the spa finishing to the rough cast should not give a pleasing effect when new, but its appearanc might be anything but pleasing after a year' exposure to a "damp, smoky atmosphere."—

H. E.

Correspondence.

MEMBERSHIP OF THE SOCIETY OF ARCHITECTS.

To the Editor of The Builders' Journal.

St. James' Hall, Piccadilly, London, W

Dear Sir,—The reply to your Crouch En correspondent in your last week's issue is no quite correct as to particulars of membershi in this Society.

Examinations are held twice a year, an there are four sections, the last one bein Sanitary Science, in addition to those mentioned in your paper, as per syllabus herewit —Yours faithfully,

C. McARTHUR BUTLER,

Secretary, the Society of Architects.

[Intending candidates should apply to th Secretary for a copy of the syllabus above referred to.—Ed. B.J.]

CEMENT COVERING FOR BRICK WALLS.

To the Editor of The Builders' Journal.

Sir,—The letter of your corresponde Anglice, in your issue for July 12 (p. 344 helps one to realise the truth of the poet dictum that "a *little* knowledge is a dangero thing"—italics mine. In asserting that ce tain technical terms used by me in the rep to which he takes exception, are "unknown the trade," Anglice commits the error assuming that he, or the district in which resides, is the centre of the plastering univers and that the terms and practices thereof a the only ones recognised in "the trade Several years of experience and residence in district where the technical terms employ by me are in daily use by thousands, and whe the class of work referred to is executed by t acre, enables me to speak with some degree authority, and to maintain the absolute corre ness on all points of what I wrote in the answ which has called forth the criticism.

To shed a little more light upon the poin raised, I may add that the cement covering referred to is employed primarily as a coveri for bricks of poor quality, that it is two-co work, the finishing coat being merely supe ficial—hence the "lightly-scored" renderi coat; that cheapness being necessarily an i portant factor, the proportion of cement in t rough stuff is kept as low as possible, combin with a reasonable efficiency; that the dam resisting qualities of the covering are not serious moment, provided it is as resistent wet as ordinary good stock brick work; a that appearance being the first factor, a float face is never employed, the rough gritty su face left from the float having a much mo pleasing appearance.

That such a covering as I specified will r turn driving rains in exposed situations, I a perfectly aware, and, I might add, neither c a ¾in. coat of much better material be rel upon to do so in all circumstances. H. E.

A New Lecture Hall at Fulham, wh has been erected in connection with t Primitive Methodist Chapel in Wandswo Bridge Road, was opened recently. Mr. Wray was the architect.

SHOP FRONTS.*

By JAMES LOCHHEAD, A.R.I.B.A.

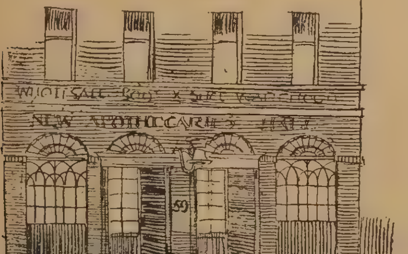
WHETHER Napoleon Buonaparte's ironical reference to us as a "nation of shopkeepers" was founded upon experience, or hearsay, or observation, the fact remains that the faculty of "buying, selling, and getting gain," has always been well developed in the British mind, and commercial interests have always maintained an important place in the progress of the country. It is therefore natural that business requirements, or more particularly for our present purpose, those special requirements which demand a "standing at the receipt of custom," should exert a strongly marked influence upon our street architecture.

By reason of the advance and multiplication of those requirements, shop building may be said to occupy a place in the study of architectural practice as important as any other, and, moreover, it occupies almost a unique position in the want of parallels in the past. Church building in the present, for instance, presents features identical with the past; modern requirements are not diametrically opposed to mediæval wants. Not so with shop building. The modern shop is to a very great extent without such parallels, and archæological researches as to the street architecture of olden times, except in a few connections which I shall discuss, serve little or no practical purpose.

It will, however, impart some interest by way of showing development, to review very generally some work of the past in the way of old time shop keeping, before proceeding with the more practical consideration of the modern solution of difficulties which did not exist for the discomfiture of architects "in the golden days."

Here let me state that *street fronts*, broadly speaking, do not come under my treatise, but, merely—I do not say "merely" in a depreciatory way—shop fronts as an integral part of street architecture.

It was invariably the custom in the olden time—by this I mean that period of which the oldest examples are on record, viz., the sixteenth and seventeenth centuries—for the owner to live over his shop, and, an Englishman's house being his castle, it followed that the house was made more important, to the comparative impoverishment of the humble, if necessary shop below. "It will be said," says Ruskin, in a tirade against the modern beatification of shops, "that much of the best decoration of the Middle Ages was in shop fronts. No; it was in house fronts, of which the shop was a part, and received its natural and consistent portion of the ornament. In those days men lived and intended to live by their shops or over them all their days. The upper stories were always the richest, and the shop was decorated chiefly about the door which belonged to the house more than to it.



NEW APOTHECARIES HALL, GLASGOW.

This relegation of the shop front to a secondary position is well shown in some of the Chester buildings and the famous Rows, where by the mere accident of encroachment, due to a mediæval laxity of building line legislation, the shop occupies an "upper floor," recessed some 8ft. from the line of street front, and thereby producing a remarkably convenient arrangement for public as well as private use, of which I shall speak later.

But public opinion superseded private taste, and no doubt the seventeenth century shopkeeper soon found that if he was to exist, his shop must be made attractive, so that from this point onward we find it at least more important than hitherto if also to a great extent less ornate.

This reticence, if you care to call it so, was due in no small measure probably to the comparative simplicity of the succeeding Renaissance, in which style, of course, new structures would be erected, while in London some early building legislation with respect to shops undoubtedly had some restraining influence, for after the Great Fire of 1666 an Act was drawn up (it is supposed by Wren) for the purpose of guiding building operations.

Some of its details are interesting not only on account of their showing that architects then had troubles on this account, but because they explain the future development, in London at least, to a certain point, which I shall illustrate.

For instance, the Act requiring "The outside of all buildings in and about the said city to be made of brick or of stone, or of brick and stone together," limits the architect in his choice of materials very considerably. One clause with respect to shops in particular, however, had a decidedly unique result. "For conveniency of shops . . . no bricks, jetties, windows, posts, or anything of like sort, shall be made or erected in any streets, lanes, or by-lanes, to extend beyond the ancient foundations, nor that any house be set further into the street than the ancient foundations, *saving only* that in the high and principal streets it shall be lawful for the inhabitants to suffer their stall boards (when their shop windows are set open) to turn over and extend 11in. and no more from the foundations of their houses into the street for the better conveniency of their shop windows." That is to say, the shop window boards might be hinged as a flap, and be turned out when the shop window was open as a stall, upon which to expose goods for sale, and, of course, to be turned in when the window was shut.

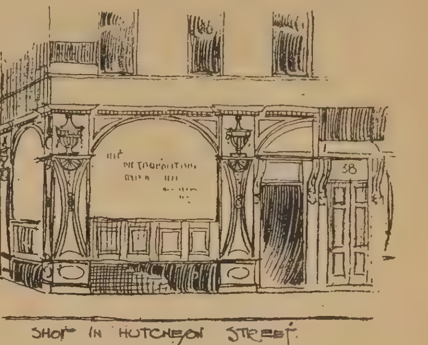
Sir Christopher's concession, however, appears to have been unduly taken advantage of, for this permitted flap came to be a fixed projecting base to the window, and the pent house shelter (which the Act had required over the footpath) became the cornice to the protruding shop front, and thus a "bulk" with foundations came to be extended over the ancient foundations.

These "bulk shops," as they were called, were in use at the end of the seventeenth century, and, not unlike the chest in the "Deserted Village" inn, the bulks "contrived a double debt to pay" by being a stall board by day, upon which the goods were displayed, and a bed by night in so far as they provided a ready couch for the "flotsam and jetsam" of Old London.

An illustration of the last of the Old London bulk shops appeared in the BUILDERS' JOURNAL for August 31st, 1898.

With the advent of the eighteenth century came a new order of things, for, although Architecture was in a kind of desolation, it was a notable time for the designing of shop fronts, and, as a counteraction to the previous regulations in the reign of George III., it was enacted that bow windows or other projections "against or before any house situate in any public street, lane, or place," should be limited to 5in. projection in lanes and 10in. in streets, a regulation which produced the well-known features of flat bow windows, some of which are still existing. Other familiar features of this period are the small windows, divided into small squares, or into various radiating arrangements of astragals, substantial piers, distinguishing signs and symbols, and appropriate signboards.

In Glasgow there are still a few examples of this era of shop fronts, and artistic evidence of the taste which characterised them exists in the premises of the New Apothecaries' Company, and others in its vicinity, which, with their quaintly shaped astragals and well-proportioned voids and solids, form quite a refreshing change from the more modern abominations in the neighbouring Trongate. The satisfactorily supported building at the corner of Glassford Street and Wilson Street, with its combination door and window, is hardly so original as the horseshoe arrangement which still exists on Hutcheson Street. Like most old examples, these possess few points for emulation in the modern shop, although, in some respects, which shall appear, we might with advantage "tak' a hint and learn."



For a long time, and until comparatively recent times, and until the improved manufacture of plate glass became known, for it is certain that the windows of a hundred years ago were limited in the size of their panes by the manufactured tables of crown glass, and that the picturesqueness of the small squares was the fitting outcome of necessity, these shop fronts underwent no great change until it was seen that the introduction of plate glass lent itself to the better display of wares.

Whether it was this supply which first produced the demand, or *vice versa*, it is hardly worth while discussing, at all events the competition between tradesmen in the display of their goods producing what Sir Walter Besant calls "the endless rows of that great and wonderful exhibition which benevolent tradesmen show gratuitously to all," soon necessitated the great business requirement of a large unobstructed surface of plate glass, for the obtaining of which, one by one, these old fronts disappeared, either to be unrecognisably transformed into the new order of things, or make way for a new building—if some of these could be called building.

It is as needless for me to dwell upon the æsthetic constructional absurdity of plate glass in this connection, or deplore the paramouncy of business interest over all æsthetics as to declaim against the absurdity of shopkeepers requiring it—they *will* have it, and they ought to know their own business. The modern shop front, therefore, has to be faced as a straightforward problem, with the chief end as *glass all over*. Certain it is, and fortunately so, that nowadays there is slightly less tendency for this all glass front, perhaps, born of a more artistic period, but the cessation of the desire has not been enough to cause a cessation of all difficulty—artistic and constructional—on the part of the architect.

As Viollet-le-Duc puts it: "What is required is a ground floor, free, as far as possible, from solid masses, piers, or walls—this is what business demands. Shops such as our times call for should present a surface entirely free, separated from the street only by glazed partitions, admitting as much light as possible."

You are all familiar with the common or garden style of thing. Glasgow is prolific in examples, and although in many cases attempts have been made to minimise the æsthetic objections, as far as circumstances and money will permit, for the most part, the whims of the shopkeeper have been realised beyond his fondest hopes.

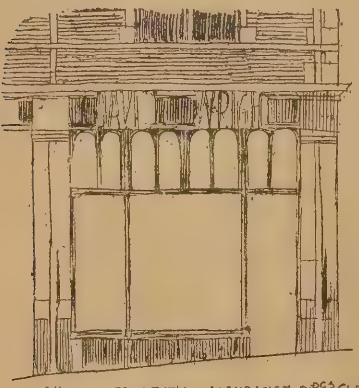
The problem is a varied one, and it is in this versatility that the principal difficulty lies. Without doubt the worst to face is the long one-shop front at the corner of a street, with a superstructure of three or four stories, where the owner insists upon the corner being rounded off in glass, and all visible means of support eliminated. This is hardly less troublesome if it is to be divided into separate shops, with, say, entrances at intervals to the flats above. As the front narrows the difficulty lessens, 'tis true, but still the client yearns for every square inch of space, obtained by the reduction, to a dangerous extent, of all means of support. The glass must, as a rule, be in one great unobstructed sheet, as if it were some inducement to buy, further reducing the architect, who might have one forlorn hope in the decorating by some means the upper portions of the window to a state of artistic despair.

---

* A paper read before the Glasgow Architectural Association on February 7th, 1899.

Into the solutions of these problems of course iron must enter largely, and by reason of its very unobtrusive utility, another difficulty has to be met (which does not concern the client) in exposing its function, which our friend would fain see concealed under a cleverly arranged combination of mirrors.

I cannot say that any of these problems have been or for that part can ever be—*under the conditions I have quoted*—satisfactorily solved. But while allowing that what "cannot be cured must be endured," it remains for the architect to minimise as far as lies in his power the offensiveness of the modern shop front and assist in promoting the refinement of the tradesmen's surroundings, and as Mr. Edwin T. Hall remarked recently "raising the standard of his wares and fabrics, and indirectly of his customers."



SHOP IN PRUDENTIAL, ASSURANCE BDGS GLASGOW
ALFRED WATERHOUSE ARCHT

This is contrary to Mr. Ruskin's dictum with regard to shop fronts "that you must not mix ornament with business any more than you mix play, for," as he goes on to say "there is not a tradesman's sign nor shelf, nor counter in all the streets of all our cities which has not upon it ornaments which were invented to adorn temples and beautify kings' palaces. . . . Many a pretty beading and graceful bracket there is in wood or stucco above our grocers' and cheesemongers' and hosiers' shops. How is it that the tradesmen cannot understand that custom is to be had only by selling good tea and cheese and cloth, and that people come to them for their honesty, and their readiness, and their right wares, and not because they have Greek cornices over their windows, or their names in large gilt letters on their house fronts? . . . It is curious . . . to see the whole system of our street decoration based on the idea that people must be baited to a shop as moths to a candle."

Possibly true; but, for all that, the decoration of shop fronts for the previous reasons is not so undesirable as Mr. Ruskin makes out, and, like everything else, requires to be carried out in a reasonable spirit.

Assuming, in the first place, therefore, that things are to remain, so far as clients' desires are concerned, pretty much as they are, there still remains to be seen what can be done to make the best of it, and assist in giving as much architectural expression as possible under the circumstances; and, in the second place, assuming that clients are willing to forego a little in window space and so on, we can discuss with profit a possible solution.

The angle of a building is at all times worthy of one's study, and a shop corner especially so. Mr. Burnet has managed to obtain a solid corner at Forsyth's building in Gordon Street, and the result while adding to the architectural effect has certainly not detracted from the commercial purpose. Where this is not possible, the ingenuity of the architect is taxed with the juggling of beams of varying lengths over an iron column, or what is rare, a stone pier.

But in the case quoted, the architect has had to contend with the conditions already stated with regard to the remainder of the fronts, with the like result so far as visible support is concerned. Whereas in the case of several shops where the same conditions of minimised support are to be observed, the result is hardly so bad inasmuch as a stanchion in place of a column has to face the dividing partition, breaking up the line of front—a questionable acquisition when a "close" has to be negotiated, which introduces a most undesirable vertical strip into the composition.

Over the whole usually a continuous signboard runs, behind which obviously are the beams, supporting the building proper. It sometimes happens that stone or granite butts are permitted between the shops, in which case a part of the supporting element is certainly visible.

Mr. Waterhouse in his Prudential buildings in Renfield Street, has to a certain extent got over this by exposing his beams entirely—the skeleton sign being placed in front—making a logical and certainly truthful arrangement.

The concession regarding piers also relegates the closes to their own position by enabling them to be lowered, and at the same time assist in strengthening the appearance of the front.

As the frontage narrows down to a strip, the necessity for columns decreases, although the beam difficulty still remains. This can be got over, of course, by an arch, which must of necessity be flat, and is usually weak in appearance, giving the appearance in most cases of having a girder concealed behind, in addition to obstructing the light.

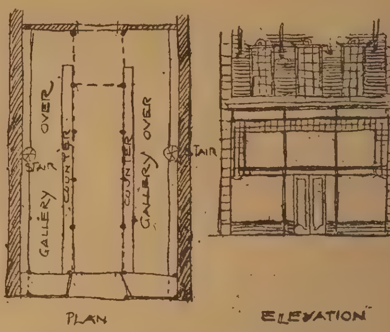
Rectangular openings admit the largest amount of light, and arched openings, especially when pointed or semi-circular limit it, and apart from the lighting power of a square-headed window, the greater facilities afforded for such fittings as blinds and shutters give it a practical advantage over an arched form.

Taking, however, "a plain, unvarnished tale" in the shape of a square-headed window-glass from sill to lintel, and assuming that the necessary evils of hidden support must be endured, a great deal cannot be done to make it less obtrusive. It is equally difficult to make it serviceable for the shopkeeper, for with the utilisation of all available space, the relegation of ventilating arrangements to an infinitesimal fret at the top, or in some cases their total omission, causes an amount of sweating which seriously interferes with the primary purpose of the glass itself.

Now if the available front must be *all* glass, it can be for no other purpose than to cause a great glitter, for so far as the display of goods is concerned, a window 8ft. or 10ft. high is ample, and the remaining space lends itself in a variety of ways to some sort of decoration, as well as providing means for ventilation and better lighting for the interior. In the Prudential example the show window proper has been ceiled at this level, a transome thrown across, and the space over divided by pilasters and arches into bays, some of which are made to open. Objection might be taken that these appear to act as supporting features, but when kept in their proper place, and receiving appropriate treatment, they need not appear to have other than decorative and convenient functions.

Mr. W. Eckstein, in a paper before the Architectural Association (published in the Builders' Journal for May 11th, 1898), threw out a valuable suggestion that this space could be well adapted for lighting the interior, and in our murky Glasgow atmosphere, the inner regions of shops are at times very dismal, which might be avoided by glazing with light prismatic glass, when an external effect as well as internal convenience could be obtained.

Numerous treatments of this space will, of course, suggest themselves, some of which might well be based upon the radiating astragal arrangement of some of the older examples.

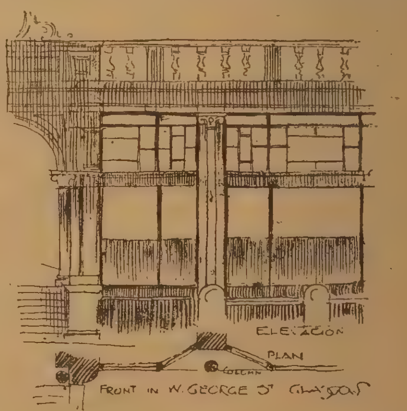


RESTAURANT IN INGRAM STREET, GLASGOW.

A useful suggestion for certain purposes is afforded by the treatment of Miss Cranston's restaurant in Ingram Street, where a high ceiling otherwise useless has been advantageously utilised by forming an entresol, the bisecting floor having been prettily emphasised by some appropriate woodwork, without interfering with the plate-glass window proper.

Now, in shops with high ceilings the goods in the higher shelves are awkward to get at, involving some dangerous feats in preserving equlibrium on the part of the assistants; a height at which goods are accessible by merely reaching, would be a great deal more convenient. For this purpose an entresol or gallery running parallel with the counter front, accessible from either end, would be more convenient; this carried right out to the window face and worked into the same, might be the means of obtaining a thoroughly logical architectural setting, as well as preserving the shopkeepers interests in the way of window display.

In some of the illustrations accompanying this paper the oriel is very prevalent, and it seems as if this is likely to become more popular with shopkeepers, as it affords more possibilities in the way of construction for the architect. I say construction advisedly, for a building in West George Street (by Mr. Gordon, I think) seems to me to afford some food for thought. Here the iron columns supporting the superstructure are exposed, and stand in front of butts, between which the windows extend in flat oriel form. If these butts were removed to give a large area of glass, the supporting column adequately strengthened, and the re-entering angles at bottom suitably protected and treated, there seems to me to be a possible solution of the difficulty, of giving some better architectural expression. The columns need not be protected, that is so far as the Building Regulations go, as their provisions for surrounding and protecting against fire "with plaster or cement, or other fire-proofing material three-quarters of an inch thick," only refer to the supports of main walls within a building.



FRONT IN W. GEORGE ST GLASGOW

(*To be concluded.*)

Bricks and Mortar.

> *"Not a hut man builds but is the visible embodiment of a thought; but bears visible record of invisible things; but is in the transcendental sense symbolical as well as real."*—
> Thomas Carlyle.

Cartwright Memorial Competition. The drawings reproduced in our centre plates were submitted by Mr. Harold A. Woodington, A.R.I.B.A., of 130, Jermyn Street, Haymarket, in the recent competition at Bradford for a memorial to take the form of a museum and art galleries, to be erected at Lister Park. The elevations were intended to be built of freestone which is very largely used in Yorkshire. The total cost was not to exceed £38,000. The principal entrance placed on the south, approached by an external staircase, is an effective feature of this quiet and dignified design.

Extending the Athenæum Club. The erection of scaffolding upon the roof of the Athenæum Club has caused many persons to wonder whether one of our best examples of classic architecture was to be spoiled by the addition of an ugly modern second storey. They need not worry on this point. The intention of the committee of the club is to provide necessary accommodation, which when Decimus Burton designed the building, was not included in the sheme of construction. The smoking room accommodation is at present very limited, and it has been deemed necessary to increase it by the addition of an attic storey. This work will be carried out with due regard to architectural fitness. The new storey will be recessed from the main walls, and only a slight glimpse of it will be obtained from the street. The Hon. John Wilson Croker was the originator of the Athenæum. He was determined that the front should be ornamented with a frieze, although some of the members were advocating the erection of an ice-house on the premises. To show them that he meant to have his own way, he had the following lines posted up in the hall:—

I'm John Wilson Croker,
I do as I please;
Instead of an ice-house,
I give you a frieze.

National Art Competition. The prize designs and other works of the students rewarded in 1899 in connection with the national competition of Schools of Art will be on view in the southern galleries at South Kensington until the end of August. The students are those of the schools under the Science and Art Department, beginning with the Royal College of Art in South Kensington. The exhibition is of about average excellence. The work done of modelling from Nature shows a falling off, and in drawing from the antique the examiners say that "the standard of work by students of the Royal College of Art is not so high as it was last year." The only recommendation the college has received is in respect of painting from the living model and designs for internal decorations and damasks. The number of works produced during the year ending with April was 53,960 from 299 schools of art and branch schools, 31,116 from 275 schools of science, and 12,454 from 454 art classes. Of all these works the number entered for national competition was 5,780, and the successful exhibits on view number 1,091. Twelve gold medals, 102 silver medals, 280 bronze medals, and 480 prizes of books were awarded to the schools and students named in the catalogue. In addition to these, honorary awards were made to free students at the Royal College of Art to the extent of five gold, thirty-six silver, and seventy-three bronze medals, and 103 book prizes, in respect of 755 works submitted for judgment. The winners of the twelve gold medals are:—Edith Olga Armour, Battersea, for designs for printed muslin; Thomas William Long, Battersea, also for a design for printed muslin; William Haywood, Birmingham, for a design for a royal mausoleum; Frank S. Eastman, Croydon, for chalk drawing figure from the nude; Lizzie St. Bell, Glasgow, for model of a figure from the nude; James Kincald, Glasgow, for design for printed hanging; Ernest H. Simpson, Leeds, for stencilled designs for the decoration of a dining-room; William J. Metcalf, Liverpool, for design for the frieze of a hall; Jennie Delahunt, Manchester, for modelled design for a ceiling; Ernest G. Gillick, Nottingham, for model of figure from the nude; Thomas Claughton, Pudsey, for modelled design for a leaden cistern-head; and Maria Thekla Pearce, West Bromwich, for oil painting from the nude figure. The recipients of honorary awards of gold medals to free students of the Royal College of Art were Mary G. Houston, George Marples, Charles J. Pibworth, and Harry G. Theaker.

Architectural Design and Drawing. The examiners in architectural design were Messrs. G. F. Bodley, A.R.A., T. G. Jackson, R.A., and Aston Webb, A.R.A. They reported that the number of works submitted for competition was larger than last year, and there were a few good designs, but, speaking generally, the level of the work was distinctly below that for several years. In many plans the lighting was not sufficiently considered. The masters would do well to set their students less ambitious subjects than those often given, such as large town halls, &c., which are quite beyond the experience of the students. Messrs. J. Belcher, T. G. Jackson, R.A., and J. J. Stevenson were the examiners in drawing from measurement. They expressed regret that the general standard of the work was lower still than that of last year. On the other hand they thought that the masters had shown greater discretion in the selection of good subjects for the students to study. With regard to full-size details of mouldings, they did not believe in the accuracy of those which were drawn with compasses. Altogether, the report is a rather depressing one, and seems to imply that the teachers have to some extent allowed their pupils to waste their time upon unprofitable and unpractical work.

Transforming the Imperial Institute. Along with the Treasury Minute issued recently was a Supplementary Estimate for £65,000 for the purchase of buildings now occupied by the Imperial Institute, and for their adaptation in part for use by the London University. The Minute is dated July 13th, and refers in general terms to the arrangements which have been made by her Majesty's Government with the governing body of the Institute respecting the whole group of buildings now in their possession. The arrangements are as follow: 1. The lease under which the buildings are held from the commissioners for the Exhibition of 1851 will be transferred to the Commissioners of Works as representing the Crown, and the Commissioners of Works will become responsible for the maintenance, rates, custody, and protection of the buildings. The Commissioners for the Exhibition of 1851 have assented to this arrangement. 2. An agreed portion of the buildings will be assigned for the use of the Institute, free of rent, but with the responsibility for internal maintenance and repairs of that portion. 3. The cost of removing the Institute from the portions of the buildings which they will surrender, including the necessary structural alterations, will be paid by Government. 4. In consideration of the transfer of the lease, the Government will provide funds sufficient to pay off the existing mortgage of £40,000 on the building, and also to discharge a floating debt of the Institute, not to exceed in all £15,000.

The London University's Premises. The following is a general description of the accommodation which the Government will be able to offer to the London University: The eastern and central portions of the main block, including the principal entrance, vestibule and staircase, and the great hall; subject to occasional use by the Institute of certain portions of the central block when not required by the University, under regulations approved by the Chancellor of the University, and subject also to certain reservations in favour of the Government of India. Also a portion of the upper floor of the inner block of building running east and west; and the temporary structure now standing in the South-Eastern Court. It has been agreed that accommodation for the practical examinations of the University in physics and chemistry shall be provided in the new buildings about to be erected for the Royal College of Science, subject to arrangement between the two bodies as to dates of use.

Trowse Newton's Dilapidated Church. It seems a pity that the quaint church in the village of Trowse Newton, which is just outside the city of Norwich, should have been allowed to fall into the state of decay it is in at present. Within and without, it is sadly in need of renovation, and, in some portions, of reconstruction. The woodwork of the interior is in many places literally rotten, and the flooring has given way, especially in some of the old-fashioned pews. The church still retains a relic of the past in the form of a "three-decker" pulpit, the ascent of which is said to be not unattended with danger. The West window is blocked with an unsightly gallery, wherein probably in past times the singers, the fiddlers, and the flautist, led the congregational psalmody. There are many interesting features in Trowse Church; the font, for instance, with its quaint but mutilated old sculptures; also the well-preserved brasses dating from the sixteenth century. The ancient history of the church is told in its varied architectural features. Outside the chancel to the North of the East window is a niche, in which once stood a statue of St. Andrew the Apostle, to whom the building is dedicated. An inscription beneath records that the figure was given by a Prior of Norwich in the thirteenth century. The present vicar, the Rev. W. H. Macnaughten-Jones, is very anxious to effect an improvement, and, with the sanction of the Bishop, has issued an appeal for £2,000.

Bishop Westcott on Art. A missionary fresco has been painted by Mr. J. Eadie Reid in the apse of St. Columba's Church, Cornhill, Sunderland. In the centre of the picture is the River Wear, which the artist has endeavoured to depict as it appeared in the days of the Ven. Bede. On either side are grouped the figures of those most prominent in the conversion of England; at the head of the first or northern group is St. Columba, representing the Celtic influence, while the other is led by St. Gregory, as the head of the Italian mission. Above these figures is to be placed a representation of Christ in glory, on whom they are all gazing. At a special service in St. Columba's on Saturday evening the fresco was formally unveiled by the Lord Bishop of Durham (Dr. Westcott). After unveiling the fresco the Bishop delivered an address, in the course of which he said that, like the poet, the artist had a prophetic gift. The beauty he portrayed was simply his discovery and not his creation. But the pursuit of Art was beset with the greatest difficulties. It was easier to limit his powers than to use them rightly, and therefore fulness of culture should be his aim, even though in the end he might be forced to acquiesce in an incomplete attainment. If, however, Art once looked for an end to itself, it passed to idolatory. It was only the corruption of Art which tempted them to think of pictures as garniture and household stuff—the appendages of luxury and pride. He thought it was nothing to wonder at that the progress of imitative Art had been slow, considering the nature of its task. Its appeal was to the senses through which the most universal perils came to the moral life. The progress of the social arts—music and architecture—had been greater. Christians, fortunately, had from the first an insight of what painting and sculpture should be. Art helped to bring back to us the sense of the divine in the field, in the workshop, and in the great course of life. The works of the artist were the books of the unlearned; nay, the books of the wisest to be pondered upon.

Modern Babylon.

An attempt to revive on a modest scale the hanging gardens of Babylon is on foot in Paris at present. M. Tabary, a well known French architect, is the chief mover in the matter. At the corner of the Avenue de Suffren and the Boulevard Garibaldi, he has built two six storey houses and planted charming triple-terrace gardens on the top of them. The extent of this aerial floral paradise is 400 square yards. For the support of the gardens he has only found it necessary to strengthen the uppermost storey with ordinary iron girders and supports. The solidity of the houses is not affected by the additional weight. Cement is laid on the topmost ceiling and then a bed of fine sand, over which are several thicknesses of a sort of coarse blotting-paper, then another layer of sand and cement. Upon this is laid the mould for the garden, and the bed is sloped so as to allow water to drain off it by the ordinary pipes of the house. M. Tabary's idea has been adopted by other architects, among them Mr. Gustave Rives. The Automobile Club, which is housed in the building opposite the Admiralty in the Place de la Concorde, has been adapted by him for a "hanging garden." On the flat Italian roof of that splendid house he has created a little park, with a pretty lawn and a fountain. The idea of roof gardens is not without an advocate in London. Mr. Wyndham, if the London County Council will let him, intends to have a roof-garden on his new theatre in the Charing Cross Road. Mr. W. G. R. Sprague is the architect of the theatre, and has designed what is practically a large and handsome conservatory of iron and glass on the roof of the theatre. It will be cut off from the theatre by a fireproof flat, and will be accessible (but only to the stalls, circle, and boxes) by a lift in which a dozen people can travel at a time.

The Proposed Cromwell Statue.

Mr. Lucas Shadwell, the member for Hastings, presented, on Tuesday last week, the following petition to the House of Commons:—"Whereas Oliver Cromwell deprived the people of this realm of Parliamentary institutions, and compassed the death of their King, and persecuted and destroyed their Church, and set himself up as the head of that most detestable form of government, a military despotism, we, your petitioners, consider him unfit to be honoured by the erection of a statue on public land, especially as, by so doing, a deliberate insult is offered in particular to that portion of the United Kingdom called Ireland, where the said Oliver Cromwell's butcheries and cruelties caused the most terrible sufferings amongst its unfortunate people, and created evils which have not yet been obliterated. Your petitioners therefore pray that your honourable House will be pleased to refuse permission for the erection of a statue to Oliver Cromwell on public land." Another member of the House, Mr. Lowther, suggested the other day that a suitable place for the proposed statue would be the Chamber of Horrors at Madame Tussaud's. It is not likely, however, that these and similar vapourings will prevent the erection of a fitting memorial to one of the greatest of Englishmen. The gift of the statue was accepted and a site granted by the late Government, and the present Government have ratified the arrangement, which will undoubtedly be carried out.

A Secret Dungeon Discovered at the Tower.

During the building of the new guard-room in the inner bailey of the Tower of London, the interesting discovery of a secret dungeon has been made. The new guard-room is situated between the Bloody Tower and the White Tower, and in preparing its foundations, a subterranean passage was discovered (or, to be accurate, re-discovered, for its existence was known), extending from the moat, near the Traitor's Gate, beneath St. Thomas's Tower, in the direction of the White Tower. The passage is lined throughout with Norman masonry and has a level floor. It runs straight from the moat into a dungeon which is completely isolated from all parts of the fortress, and has communication with the upper air by a shaft which descends into the passage. Several objects of interest were found in the dungeon. These consist mainly of masses of potsherds, amid which are fragments of green-glazed ware such as was common throughout the Middle Ages; several broken brown jugs, known as bellarmines, and pieces of coloured delft and Fulham ware—all no doubt fragments of the broken utensils of the garrison, thrown down the shaft after the dungeon had ceased to be used, in Elizabethan times and later. A number of stone and iron cannon shot were also found. One of the most interesting finds was a mass of Roman cement, in which are embedded three of the well-known tiles with which the Roman builders banded their walls. The bottom of the subterranean passage is 17ft. beneath the level of the ground, and the shaft by which access to it is gained descends straight into it. Towards the moat the passage was closed by a strong iron grille firmly embedded in the masonry; at its other end is the dungeon, a horrible black cell, oval in shape, originally vaulted, and measuring about 7ft. across.

The "Vandalism" at St. Dunstan.

In last Wednesday's issue of the "City Press" Mr. Allen S. Walker, of Hampstead, laments the various misfortunes which have befallen the parish of St. Dunstan-in-the-West. He writes: "One cannot help being struck with the singular misfortune which seems to be continually attending the parish of St. Dunstan-in-the-West. In and about 1831 the parish was greatly purturbed at the vandalism which tore down its ancient church and erected a 'Revived Gothic' in its place. In 1878 the parish lost Wren's graceful gate of Temple Bar, and afterwards received in place of it the very doubtful Griffin, which leers threateningly upon all who dare to enter the City from the westward. That interesting Jacobean building, 17, Fleet Street, with its royal history and finely-moulded ceiling, has been announced to disappear almost immediately, and, in fact, the parish bids fair to be left without any features of historic or architectural interest. When the present 'Revived Gothic' church displaced the ancient St. Dunstan's, it had two only redeeming features—the one its decidedly stately and graceful tower, and the other a statue of Queen Elizabeth, formerly standing on the gate of Ludgate. Now, in this year of grace, 1899, to complete its annals of unfortunate loss, the parish is threatened with the practical spoliation of these two redeeming features of its church. As surely as the offices on the west of the tower are extended as proposed, so surely will the whole effect of the tower be disfigured. If, at any future time, the intended rectory is built to restore the balance on the east of the tower, then the statue of the Virgin Queen will cease to be a feature of Fleet Street, and the tower, whose stateliness depends upon its isolation and projection from the adjacent buildings, will be finally ruined."

Ranworth Church.

The old church of Ranworth, Norfolk, requires renovating very much. It is a fourteenth century building of somewhat ordinary type, but once possessed a roof of timber richly carved and gilt, which was taken down in 1811 and replaced by a very inferior covering. The great glory of the church is its rood screen, and funds are required for its proper maintenance. It is a very fine example of the school of decorative painting which flourished in the eastern countries during the fifteenth century. The work was very probably done by travelling artists from the Lower Rhine and the Netherlands, although there are traces of local influence. The faces of the Apostles and Saints have, unfortunately, been almost obliterated, though enough remains to give an idea of the dignity and grace they once displayed, even if there was not such an example as the head of St. Jude in the neighbouring church of Cawston to refer to. The rich ornament on the robes of the figures is still in excellent preservation, and is of the highest possible value in the history of art, forming a splendid record of mediæval textile pattern. The rood itself has, of course, disappeared, but a great deal of the sculpture of the screen is still left, the richness of the central arch alone showing with what care and completeness the whole work was originally done. Of other objects of interest in the church the most important are the unique lectern, some good misericords and a pulpit. An appeal is being made to the public for funds to restore the church, but no restoration of the paintings, in the ordinary sense of the word, is intended. It is desired to raise the sum of £4,350, and more than £3,000 is urgently needed to make the fabric of the church sound enough to protect the screen against the weather. Subscriptions to the fund may be sent to the vicar, the Rev. R. L. Paterson, Ranworth, Norwich, or to the treasurers of the fund, Messrs. Barclay and Co., Norwich.

The New War Office.

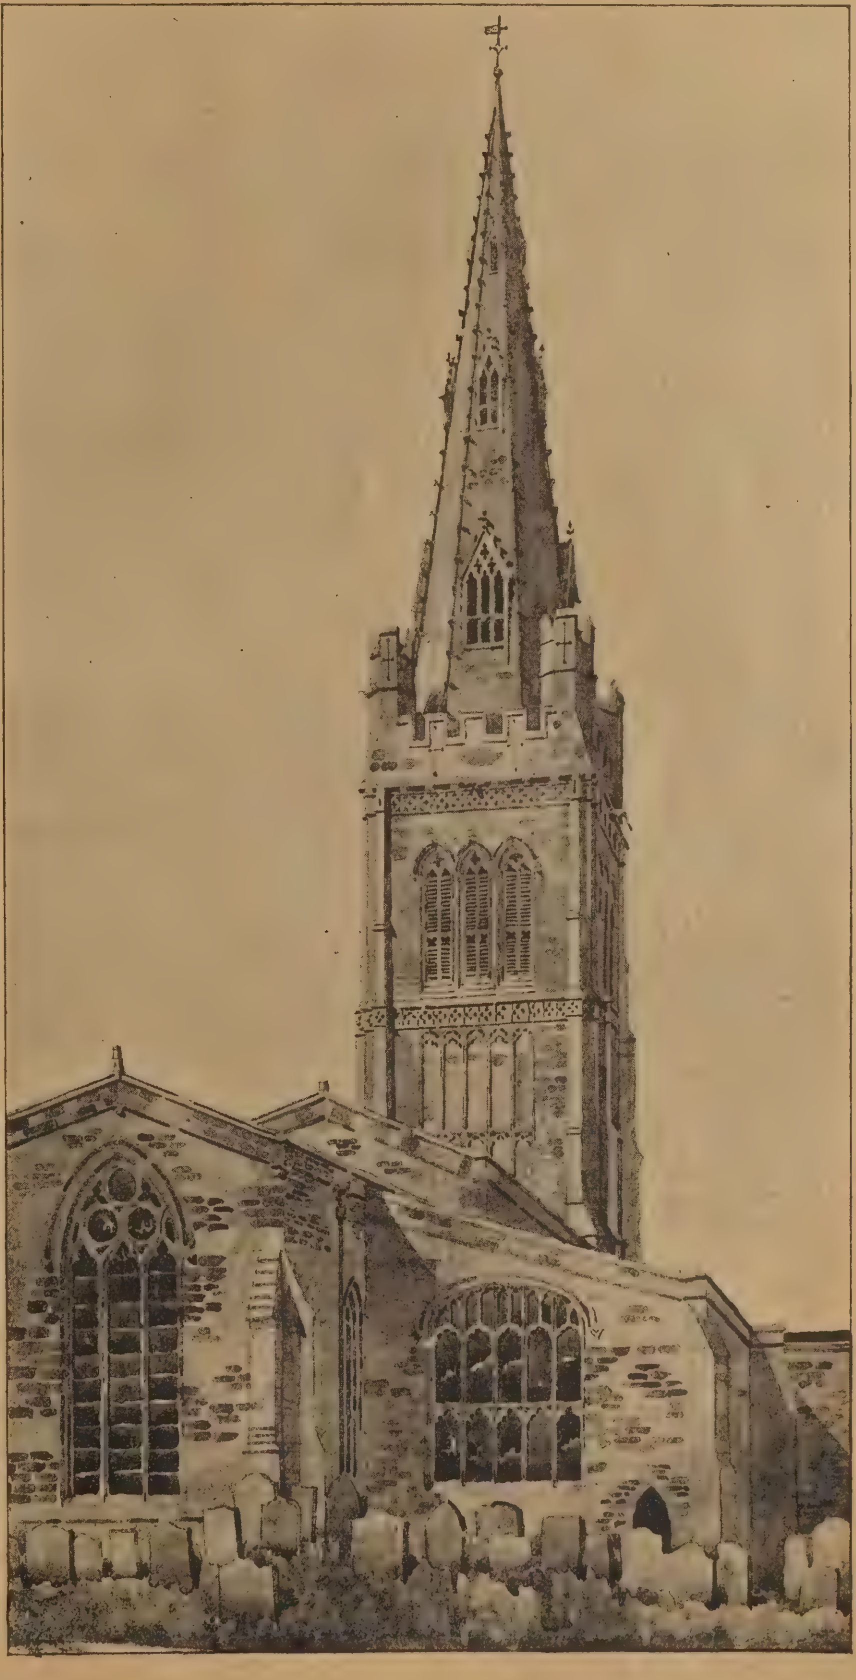
Last Friday the Earl of Wemyss moved in the House of Lords that it was in the opinion of the House desirable that models of all public buildings of importance about to be erected at the public cost should be made and publicly exhibited. He thought that this was more especially to be desired at the present time, and the system he proposed was the almost universal custom in other countries, and had been successfully adopted in our own when Sir Henry Layard was First Commissioner of Works. If a model such as he proposed had been prepared in connection with the new Government buildings in Whitehall the defects of the architect's design in relation to the surrounding buildings would at once have been apparent. All matters affecting public buildings were entirely in the hands of the Office of Works. He had had a long experience of Parliamentary life, and, having followed since 1841 the action of the Office of Works with regard to public buildings and monuments, he had no hesitation in saying its career was marked by many blunders. Was the First Commissioner of Works appointed because of any special aptitude with regard to buildings? Not necessarily. The office was simply regarded by young Ministers as a half-way house between an Under-Secretaryship and a seat in the Cabinet. Among the monstrosities for which the Office of Works was responsible was the flight of stairs in Westminster Hall, which entirely altered the character of the grand old pile. The memorial he had had the honour of presenting to Lord Salisbury was one of the most weighty ever presented. It included the signatures of an archbishop, several bishops, six dukes, two field-marshals, and the names of peers on either side showed the interest taken in this national non-party question. A memorial such as this deserved consideration, and all that the memorialists asked was that for the sake of those who come after us all possible care and precaution should be taken to ensure the erection of War Office buildings in all ways worthy of the site. On the strength of this memorial he rested his motion.

Non-Competitive Designs.

The Marquis of Lansdowne, in reply, said the Government were far from treating the memorial with disrespect, but on the contrary liked to reflect that the memorialists and the Government had the same object, that for a purpose of such importance no building should be erected unworthy of the site and inharmonious with the surroundings. The noble earl asked that a model should be exhibited whenever a public building was about to be erected, in order to protect the public against the erection of an unworthy or inartistic structure, and, above all, that there should be an appeal from the Government of the day to some other tribunal, the precise character of which he certainly failed to explain to the House. Was it so clear as the noble lord supposed, that there was much instruction to be gained from the exhibition of models of buildings? A model on a table never by any chance presented the appearance of the actual building. A model would enable you to regulate the size and proportion of a building on Government ground, but there was no power to regulate buildings alongside on ground not the property of the Government. You might adjust the height of the new War Office buildings, but the huge building, Whitehall Court, behind might put out the whole scale of proportion. As regarded the War Office buildings, it was impossible to comply with the request for a model, but in regard to buildings to be erected hereafter the Chief Commissioner of Works would consider the suggestion. A great part of the speech of the noble earl was an indictment of the manner in which plans were prepared, and their lordships who signed the memorial might not be fully aware of the steps taken by Her Majesty's Government when the matter was decided. The Government decided not to adopt the procedure of inviting competitive designs. The general result of recourse to competitive designs was generally admitted to be unsatisfactory, and our best architects refused to take part in such competitions. Putting that procedure aside, the Government invited the Institute of British Architects to recommend the names of a certain number of architects who in their opinion were well qualified to undertake a building of this sort. A list of names was sent, and a committee of the Cabinet considered these with designs of work done by the architects, and from the list selected two gentlemen, Mr. Young and Mr. Brydon, both architects with considerable reputation. These two gentlemen sent in designs for the new public offices, and these were examined by a committee presided over by the president of the Institute of British Architects and professor of architecture to the Royal Academy. Then the designs were published in March in various illustrated papers, and on the whole the verdict of public opinion upon them was exceedingly favourable.

No Further Delay. The plans and specifications had all been prepared, and they were ready for the quantity surveyor, the ground had been broken in order to test it for the foundations, and to ask them now to hold their hands and to begin again seemed to be an altogether unreasonable proposal. The site, which was worth £20,000 a year, had lain idle quite long enough. The War Office at this moment was scattered about in no less than eleven different buildings; it was an intolerable state of things which interfered to an extent which he did not suppose anybody realised with the efficient conduct of business, and they protested against any further delay in supplying that office with a suitable home. How was the noble earl going to take a *plébiscite* on this matter of plans? What was in the noble earl's mind was a preference for his own plan which he had fathered and put before the public. He admitted that in the noble earl's plan there was a very beautiful façade, but the building was entirely unsuited to a public office; it would completely dwarf the Horse Guards, it cut the site to waste in a most reckless manner, it would cost more money, and it would provide only 17,000ft. of flooring, instead of 29,000ft. as in the Government plan. The fact was the noble earl began at the wrong end. Instead of saying, "I want a public office containing such and such accommodation, give me a beautiful building to put it into," he said, "Here is a beautiful building, shove your public office into it, it has to get there somehow." The noble earl was thinking entirely of the external appearance of these buildings; he himself thought also of the occupants. No amount of adaptation would ever make the plan of the noble earl fulfil the requirements on which they insisted. The Government contended that their buildings would be a very useful and ornamental addition to the buildings which already surrounded Whitehall, and it was their fixed intention to go on with the construction of these buildings as rapidly as possible. After some remarks by Lord Stanmore, the Duke of Norfolk, and the Marquis of Lothian, the motion was withdrawn.

Kettering Church, Northants. This church belongs to the Perpendicular period, with the exception of some few small portions of an earlier date, the remains of a previous church. The tower and spire are, perhaps, the most interesting features. They, together, reach a height of about 176ft., and are well proportioned, good in detail, and good also as regards the quality of the masonry. Our illustration is taken from a wash drawing by Mr. J. Hervey Rutherford which was one of the set that gained the Pugin Studentship prize at the Royal Institute of British Architects, in January this year.



KETTERING CHURCH, NORTHANTS. DRAWN BY J. HERVEY RUTHERFORD.

Professional Practice.

Bedminster.—The foundation stone of a new mission church was laid recently by Lady Smyth. The church is designed in the Gothic style, red Winterbourne stone being used with Bath stone dressings. It has an open timber roof of pitch pine, covered with patent interlocking tiles. At the east end, and raised three steps above the floor of the nave, is a spacious chancel, which will be fitted with choir stalls, room being left for a full-sized two-manual organ. The sanctuary is raised one step above the floor of the chancel, from which it is divided by an oak rail resting upon wrought iron standards of ornamental design. The church is to have an aisle on the south side, divided from the nave by arches and columns of Bath stone; the aisle will be divided by sliding swivel partitions to form five classrooms for Sunday school purposes, each classroom being 16ft. square, and having separate windows. At the west end are to be two spacious vestries for the clergy and choir. Beneath the vestries there will be a kitchen, heating chamber and various offices. The clergy and choir vestries have separate entrances. The main entrance porch will be on the north side; the floor will be laid with encaustic tiles, as will also the entrance lobby to the vestries. In the east and west gables there are to be tall three-light lancet windows; the whole of the windows will be glazed with cathedral glass in lead squares and quarries. The pitch pine woodwork of the roof will be wrought to a fine smooth surface and left in its natural colour. The church has been planned to seat 700 worshippers, exclusive of the choir. The architects are Messrs. P. Munro and Son, of St. Stephen's Chambers, and the contractor is Mr. E. Walters.

Glasgow.—At the Glasgow Exhibition of 1901, the great concert hall and the machinery section buildings will be erected from plans by Mr. James Millar, of Glasgow. The concert hall will be situated in the West End Park in front of the Kelvingrove Museum. It is circular in plan, and measures 143ft. in width by 162ft. from the back of the gallery to the organ case. Its internal diameter is almost as great as that of the Albert Hall, London, and with the exception of that building its floor area will be greater than that of any hall of a similar kind in the kingdom. The auditorium will accommodate 2,500 persons and the gallery 1,500, so that the total seating accommodation is 4,000. The platform will seat an orchestra of 100 performers, and a chorus of 400 persons. The grand organ will occupy the centre space over the platform. The whole will be constructed, as in the case of the main buildings of the exhibition, of steel framework covered with fibrous plaster slabs. The height of the roof is 70ft. at the centre, a cupola at the top acting as ventilator. It is expected that the Town Council will decide to leave this building standing at the close of the exhibition, and retain it as a permanent concert hall or winter garden. The machinery section will be erected on a vacant space called the Bunhouse Ground, immediately opposite the western corner of the main buildings at Dumbarton Road. It will be used for the display of machinery exhibits, and will be connected with the principal portion of the exhibition by a covered way constructed across Dumbarton Road. The bridge springs from between two towers at each side of the road, and has a flat spanning arch which springs from pillars erected on the edge of the pavement. From the end of the bridge on the Bunhouse side a covered verandah extends the full length of the Dumbarton Road frontage It is estimated that this building, including the bridge, will cost over £20,000.

Harrogate.—The assessor in the competition for a new Kursaal (Mr. Frank Matcham, architect, 9, Warwick Court, W.C.) has given his award, which is as follows, viz.:—1st premium, £150, Mr. R. J. Beale, Westminster Chambers, 9, Victoria Street, S.W.; 2nd premium, £100, Messrs. Eade and Johns, architects, Ipswich; 3rd premium, £75, Messrs. Crosby and Power, 9, St. Martin's Street, W.C.

Newcastle.—At a meeting of the New Tramways and General Purposes Committee of the Newcastle Corporation, held on Tuesday, last week, the appointment of an architect for the new electrical power station, was considered. Applications were received from several local architects. It was decided to appoint Mr. B. F. Simpson, of Grey Street, to fill the position.

The new Infirmary Committee, with the assistance of Mr. Waterhouse, last Saturday week placed the competitive plans for the Jubilee Infirmary, to be erected on part of the Town Moor. The estimated cost of the selected plans is £150,000. There were twenty-three architects in Newcastle and elsewhere invited to compete; eighteen accepted the invitation. Six afterwards withdrew, while four did not send in plans, thus reducing the actual number of competitors to eight. The adjudication of the committee is as follows:—1, Messrs. Wm. Lister Newcombe, Newcastle, and H. Percy Adams, London, who are in this matter acting conjointly. These gentlemen secure the building of the new infirmary. 2, Messrs. Simpson, and Milnes Allen, London (premium £150); 3, Messrs. Gibson and Pite, London (£100); 4, Mr. W. Henman, Birmingham (£50). The new infirmary is to contain 400 beds. In the design adopted, all the surgical wards are on the ground floor. The architects submit an alternative scheme, on cheaper lines, costing a little over £100,000. The area of the new building will be 107,886 superficial feet, of which 15,921 will be taken up by the administrative block. The plans have been exhibited in the Town Hall.

Royton.—The memorial stones of a new Baptist chapel and schools were laid recently. The new chapel and schools will be in the Gothic style, comprising a range of buildings two storeys in height. The schoolroom, which will be underneath the chapel, is designed on the central hall principle, the main room being 71ft. long, 24ft. wide, and 14ft. 9in. in height. The whole of the eleven classrooms will be separated from the main hall or schoolroom, with openings filled in with pitch pine framings and glass screens. The whole of the walls to school and classrooms are to be finished off in pitch pine wainscotting 4ft. 6in. in height, and all the classrooms will be seated round with pitch pine seats. In front of the rostrum in the schoolroom will be the baptistry enclosed within the platform. The school will provide accommodation for about 400 scholars. The chapel will be erected directly over the schoolrooms, and will be 71ft. long, 44ft. wide, and 34ft. high from floor to ceiling. The main entrances are to be on each side of the front of the building, and will lead into two entrance porches and thence to the two aisles of the chapel, which is capable of seating 366 persons. The front of the chapel will be built with Hipperholme parpoint base, and with Halifax polished stone dressings, and it will be faced with Ruabon stock bricks. The whole of the general internal fittings to the chapel are to be in selected pitch pine, the roof of pitch pine being semi-circular up to collar beams. The back of the premises will be occupied by the minister's vestry and young mens' institute, also by kitchen arrangement for parties, and a cellar to contain heating apparatus. The whole of the buildings will be heated with hot water, and ample provision will be made for ventilation by means of Tobin's inlet tubes and mica flap outlets, with tower ventilator on chapel roof. The front window of the chapel will be glazed with ornamental lead lights, and the other windows with cathedral glass of neat design. The amount of the contract for the whole of the work is £2,554. The architect for the building is Mr. David Wolstencroft, of Royton.

The New Diocesan Church House for Liverpool, the foundation stone of which was laid last week by the Countess of Derby, is to be built at a cost of between £30,000 and £40,000.

Keystones.

The New Theatre Royal at Chatham, which was opened last week, has been built by Alderman C. E. Skinner from designs by Mr. G. E. Bond.

Gift of a Church.—The Earl of Carysford has presented to the inhabitants of the ancient town of Arklow, County Wicklow, a fine new church. The building has cost his lordship £30,000.

The Foundation Stone of a New Parochial Institute has been laid in connection with the church of Emmanuel, Leeds. The cost of the undertaking is estimated at about £4,500.

Bradford Antiquarian Society.—A party of about seventy members and friends of this society visited Tong and Fulneck last Saturday week. The party spent a very enjoyable time in inspecting these places.

An Addition to Warminster Cottage Hospital, in the shape of a new wing, was opened by the Bishop of Salisbury last week. The addition is to be used as a men's ward, and has cost about £1,000 to erect.

A new Fire Station at Lewisham was opened last Thursday. The building is in red brick and has been erected in the High Street. The site cost £975, and the tender of Messrs. Holloway Bros., of Battersea, was for £13,600.

New Public Offices at Hipperholme were opened last Wednesday by Mr. Thomas Brown, chairman of the Hipperholme Urban District Council. The new offices are situated at Whitehall, and have been erected at a cost of about £3,000.

The New Technical School at Durham is to cost about £7,000. The foundation stone was laid last week by the Earl of Durham. The architects are Messrs. Oliver and Leeson, of Newcastle-on-Tyne, and the contract has been let to Messrs. Gradon and Son, of Durham.

Sir William Richmond, R.A., has resigned his position of Professor of Painting in the Schools of the Royal Academy, and Mr. Herkomer, R.A., has been elected to the post. There were only two candidates for the office —Mr. Herkomer and Mr. Storey.

The First Block of the New St. Boniface College, Warminster, was consecrated by the Bishop of Salisbury last Tuesday week. The new block has cost £3,500. The college, which will be a handsome Jacobean structure, is estimated to cost over £10,000.

Durham Cathedral Vestry.—The Dean and Chapter of Durham have decided to rebuild the ancient vestry of the cathedral on the old foundations. It stood against the wall of the south choir aisle, between the transept and the nine altars, and was built by the Prior Henry de Luceby.

The Royal Academy Exhibition.—As soon as the exhibition is closed Mr. T. G. Jackson, R.A., will begin the projected alterations in the entrance hall and vestibule. The vestibule has always seemed mean, but when marble and other handsome decorations are given it the right note will be struck.

New Church and Schools at Cheetham.—The ceremony of laying the memorial stones of new schools for Trinity Presbyterian Church took place recently. The new church and schools are being erected at a cost of £5,000, but the ceremony in connection with the church is postponed until later in the year.

Proposed Memorial to Simon de Montfort at Evesham.—A preliminary meeting of the committee formed to promote this object was held at the Star Hotel, Worcester, last week. It is proposed to erect an equestrian figure in aluminium on a suitable base and under a canopy on the spot where Simon de Montfort was buried, that is close to where once stood the high altar of Evesham Abbey, of which there is now no trace. Permission has been obtained from the owner of the land, Mr. E. Charles Rudge, who is lord of the manor, and Mr. R. A. Briggs, F.R.I.B.A., has been appointed architect. The monument is estimated to cost about £2,500.

The Foundation Stone of a New Drill Hall at West Bromwich was laid by the Mayor (Councillor S. Pitt) at the beginning of last week. The new hall is to be built from plans by Messrs. Wood and Kendrich by Mr. J. Dallow, at a cost of about £2,000.

Torry School, Aberdeen, is to be Enlarged at a total cost of £3,500. The following are the contractors for the work: Masons, A. Milne and Sons; carpenters, J. and W. F M'Robb; slater, William Coutts; plumbers, J. Blaikie and Sons; painters, Lamb and Sons; heating engineer, Robert Tindal; iron and steel work, J. Abernethy and Co.

The Lighting and Decoration of the Liverpool Masonic Hall.—The quarterly meeting of the Hall Committee of the Masonic Hall was held recently, at which it was agreed that on the completion of the installation of the electric light, tenders should be procured for the decoration of the large lodge room, chapter room, banquetting room, &c.

Town Hall for Heckmondwike.—The Heckmondwike District Council acquired a triangular block of cottage property on the top side of the town's green some time ago. At a council meeting recently it was decided to appropriate the site for a Town Hall, and to apply for borrowing powers for the amount paid for the property for a period of fifty years.

The Mowbray Memorial.—It was decided last week that, with the concurrence of the Speaker and the First Commissioner of Works, the memorial to the late Sir John Mowbray should be placed eitwer in the committee room in which he presided for so many years over the Committee of Selection and of Standing Orders, or in the corridor staircase adjoining that committee room.

A Building Accident at Monaco occurred on July 29th. The wall of a building which is in course of construction as an annexe to a hotel at Condamine, collapsed, and fell upon about fifty workmen who were engaged on the premises. Three of these were killed, and eleven more, who were rescued from the *débris*, were found to have sustained more or less serious injuries.

The First Pair of Girders for the New Kew Bridge arrived last Wednesday from Darlaston. They are 85ft. in length. At Hammersmith Station it took four hours to get each of them on to specially constructed trollies, and sixteen powerful dray horses were required to draw each girder from the station yard to Kew Bridge, a portion of the station wall and a fence being knocked down in the process.

Public Gardens in Liverpool.—A Local Government Board inquiry was held recently in the Liverpool Municipal Offices, by Mr. G. W. Willcocks, M.I.C.E., one of the Board's inspectors, with regard to an application of the Corporation for sanction to borrow £1,400 for the purpose of laying out as public walks St. Martin's Recreation Ground and St. Martin's-in-the-Fields Churchyard. The inspector subsequently visited the sites.

New Freemasons' Lodge at Hornsea.—The foundation-stone was laid recently of the new Masonic temple of the Alexandra Lodge, in Eastbourne Road, Hornsea. The building, which is to be a two-storeyed one, will be of red and white stock bricks, with stone dressings. On the ground floor there will be a dining hall capable of seating upwards of seventy persons. Bro. Peter Gaskell, P.M., P.P.G.O., is the hon. architect and clerk of the works.

Bromley Wesleyan Chapel is being Renovated at a cost of over £300. It is being re-floored and re-seated with pitch-pine by Mr. C. A. Horton. There will be four pitch-pine screens, with leaded lights (two on each side of the aisles). A 3ft. dado is being put round the walls. The aisle doors will be covered with red baize, relieved with oak beading; and the porch is being laid with encaustic tiles. The chapel ceiling will be covered with Anaglypta in the Renaissance style, and the gallery ceiling is also being covered with Anaglypta of Italian design. The panels round the gallery front are being fitted with Lincrusta-Walton panels.

The Redecoration of Stewart's Hall, Huntly, is being executed from designs by Mr. Marshall Mackenzie, of Aberdeen, by Mr. A. Robertson, of Huntly. The hall is being artistically treated. Immediately over the ground lining runs a richly-stencilled border, relieving the filling, which is run off in subdued crimson. The whole is surmounted by a frieze, which harmonises well with the woodwork of the roof, which has been washed and revarnished.

A Novel Church.—The minister of the first Baptist Church of Columbus, Ohio, is having a church built in which a theatrical stage will serve as a pulpit. The new building is planned exactly like a theatre. There will be private boxes with curtains, and the choir and instrumentalists will sit before the stage in the place usually occupied by the orchestra. The body of the church will be fitted with foyer seats. Rooms for checking hats, cloaks, and umbrellas will be provided.

Wesleyan Central Hall for South London. — A series of fifteen commemoration stones were laid a short time ago in what is to form the main entrance of the new South London Wesleyan Mission Central Hall, now being erected at the corner of Bermondsey New Road and the proposed Bermondsey approach to the Tower Bridge. This hall is estimated to cost £30,000, and is to have a seating capacity for nearly 3,000 persons, and a smaller hall to seat 800 persons is to be built below the street level.

New Parochial Buildings at Bethnal Green.—The Bishop of London recently laid the foundation stone of the parochial buildings in connection with the Church of St. James the Less. The buildings, including furnishing, will cost about £16,000, and will comprise a mission hall, a church parlour, day and Sunday schools, clubs for men and boys, girl's technical drawing and cookery rooms, a gymnasium, and a dispensary. When finished these buildings will be the largest parochial premises in East London.

New Lairage and River Frontage Works at Deptford.—Mr. W. H. Liversidge, chairman of the Cattle Markets Committee of the Corporation of London, drove the first pile of the river frontage works and laid the first stone of a block of new lairage at the Foreign Cattle Market, Deptford, last week. The object of the frontage scheme is to connect the existing jetties so as to form one continuous river frontage, and the estimated cost is £15,000. The new lairage will cost approximately £23,000.

Enlargement of St. Mark's Church, Newtown. — At the Liverpool Consistory Court recently an application was made for permission to enlarge St. Mark's Church, erect a chancel, provide an organ, and increase the sitting accommodation. The cost would be about £2,200. The nature of the alterations was explained by the architects, Messrs. Heaton and Ralph, of Wigan, and the Vice-Chancellor granted a faculty on condition that the work was commenced within twelve months.

Clearing Leeds.—The Leeds Corporation has been clearing out "rookeries" and slums not fit for human dwellings, and it will not be long before the last will be seen of many of the city's old courts and thoroughfares. Wood Street has disappeared, the Shambles are quickly following, and now an old yard known as "Infirmary-yard," between Kirkgate and Market Street, but having no thoroughfare, is just being cleared of its fifty houses, many of which were built in the reign of Queen Anne.

New Library for North Bristol.—A new library is to be erected in Cheltenham Road. The site has cost £2,575, and the contract for the library has been let to Messrs. Wilkins and Son for £7,439. The building, which has been designed by Mr. W. V. Gough, of Bridge Street, will comprise a spacious reading room, in addition to the lending department and other offices. Application is to be made to the Local Government Board for permission to borrow £8,800 for the erection and equipment of the new library.

The Memorial Stone of a new Primitive Methodist Manse, at Ilkeston, was laid by Mr. George Wolliscroft recently. The new building is to be built in semi-Gothic style, in red bricks with stone dressings. The entrance hall will be 7ft. wide, and there are to be four rooms on the ground floor, and a like number on the next floor, as well as an attic. The contract for the work is £588. The architect is Mr. G. H. Micklin, of Ilkeston, and the contractor is Mr. E. L. Clayton, of Lord Haddon Road, Ilkeston.

The New Miners' Institute and Club at Seaton Burn has been erected at a cost of about £332, and was opened recently. The new structure is situated in the centre of the village, and is substantially built of freestone with plain dressings. Inside, the walls of the various apartments are lined with timber stained and varnished. On the ground floor there is a commodious billiard room, with two tables, while upstairs there are apartments which will be utilised as a library, committee, and smoke rooms. The architect is Mr. Amos Grey.

Serious Fall of a Bradford Labourer.—Whilst a man named Sim Wilkinson, labourer, in the employment of Messrs. R. and F. Dawson, contractors, of Great Horton, was engaged in the erection of some scaffolding at the old Bowling Ironworks, Bowling, Back Lane, he slipped and fell backwards to the ground, a distance of 25ft. Fortunately his fall was broken by his striking against a ladder, but when help was rendered he was unconscious, and had sustained injuries to the head and a fracture of the left arm. He was removed to the infirmary.

Burne-Jones Memorial Fund. — The executive committee of this fund, who were charged with the selection of a picture to represent Sir Edward Burne-Jones in the National Gallery, announce that they have secured the offer of "King Cophetua and the Beggar Maid," which belongs to the executors of the Earl of Wharncliffe, who had agreed (subject to the approval of the Court of Chancery) to sell it to the committee for the sum of £6,500. The funds already subscribed and acknowledged amount to about £4,000, and there is therefore needed £2,500 to complete the purchase. Those who desire to be associated in this gift to the nation in memory of a great artist, are invited to forward their donations to Messrs. Glyn and Co., 67, Lombard Street, E.C., or to the hon. treasurer, Mr. Alexander Henderson, 52, Princes Gate, S.W.

Church Congress Art Exhibition.—Lord Dillon, as President of the Society of Antiquaries, with the secretary and treasurer of that society and representatives of kindred bodies, have issued a letter inviting contributions of articles of interest to the loan collection in connection with the Ecclesiastical and Educational Art Exhibition, which will be held as usual in conjunction with the Church Congress. Special provisions will be made by Mr. Hart to ensure the safety of articles on loan, and a committee of antiquarians and archæologists will see that those provisions are carried out. It is suggested that a short description of objects intended for the loan collection should be sent as soon as possible to Mr. Hart, at Maltravers House, Arundel Street, Strand, W.C.

The Tyne Theatre, Newcastle, was reopened last week after having been closed for three weeks for the purpose of redecoration. From the entrance doors away to the stalls and upstairs to the circle, the woodwork has been painted in white "pearline." The walls have been covered with silk brocade, and there is a dado of Lincrusta Walton set off by a golden slip. Within the auditorium the walls have been scraped and covered with a red-tinted paper. The stalls have been re-upholstered, and the floors have been recarpeted. The new wings of the stage have been painted by Mr. James Hicks, the resident artist. Other parts of the building have been renovated, including the refreshment bars. Mr. W. E. Harker, of Grainger Street, carried out the work of renovation, and Mr. Samuel Sykes, of Westgate Hill, attended to the decorating work.

New Patents.

The following abridged description is specially drawn for the Builders' Journal and Architectural Record *by Messrs. Hughes and Young, Patent Agents, 55 and 56, Chancery Lane, London, W.C., who will give advice and assistance free to our readers on all patent matters.*

7,687. Walls, Partitions, &c. — Patentees: J. Sheppard, of Hornsey Lane, N., and F. Dashwood, of Hersham Road, Walton-on-Thames.—Relates to improvements on hollow bricks and tiles. Dovetail grooves are formed in the sides and ends of the bricks and tiles, to receive mortar, and dowels of mortar in the perforations lock the bricks and tiles together. Shallow dovetail grooves may be formed in the faces of partition tiles to receive keys of plaster. The moulded bricks and tiles are stacked in racks between corrugated pallets which are perforated to allow air to circulate freely.

7,808. Buildings, &c.—Patentee: W. Borrows, of Providence Foundry and Locomotive Works, Sutton, St. Helens, Lancashire.—Floors and flooring; girders and beams. The girders rest on another girder, and the three are united by clip plates, the bolts of which do not pass through the girders. The brackets or hanger may be attached to the girder in the same manner.

16,817. Fastenings (Window and Door).—Patentee: G. Krause, of Rudersdorfer Strasse, Berlin.—A wedge for blocking doors and windows, consists of a wire frame with three or more prongs which are bent at right angles to the main portion. The bar is placed close to the door, &c., and it and the prongs rest on the floor, forming a wedge to prevent the door, &c., from being opened. The wedge may be formed from a bent metal plate with prongs and may have an adjustable spring plate formed integral with or attached to it. The wedge can also be used to prevent the closing of a door or window by an air draught.

17,749. Roofs.—Patentee: E. B. Podmore, of Birds Royd, Brighouse, Yorkshire.—The turned up edges of zinc or other roofing sheets are covered with metal caps secured by screws. Asbestos or like packing is inserted between the flanges of the cap and sheets.

22,712. Stays for Window Casements.—Patentee: M. Platzer, of Tirschenreuth, Bavaria.—The stay consists of a rod telescoping on to a sleeve and capable of being secured in any position by a binding-screw on the sleeve. The sleeve is pivoted to the frame, and the rod to the sash, or vice versa, the sash being held closed, or open in any desired degree. In the case of double windows, the stay is preferably arranged between the windows.

Bradford Theatre Royal has been renovated and altered at a cost of over £2,000. In the auditorium the ceiling has been entirely remodelled in fibrous plaster, and is arranged in a geometrical design inclosing panels painted to symbolise the arts. The proscenium has been enriched by ornamental mouldings in plaster and carved wood work. The ceiling of the pit is treated in Lincrusta Walton, and the ceilings of the circle, vestibule, and foyer in Tynecastle of rich design and high relief. The foyer itself has been rearranged. In the gallery have been placed rows of ornamental ironwork, painted and gilt, which will render access and egress more convenient. The decoration of the exterior of the building has also been renewed. The contractors for the different portions of the work are:—Decorations, Messrs. Jonas Binns and Sons, Halifax; masonry, Mr. W. Johnson, Bradford; decorative ironwork, Mr. Albert Wood, Bradford; and electric fittings, Messrs. Verity and Co., Manchester and Birmingham.

New Companies.

Jarrah Timber and Woodpaving Corporation, Limited.

The first batch of allotment letters for the issue of £100,000 five per cent. first mortgage debenture stock of the Jarrah Timber and Woodpaving Corporation, Limited, have been posted.

THE VENTILATION OF SEWERS AND DRAINS.*

By R. READ, Assoc. M. Inst. C.E.

THE vexed question of sewer ventilation is a hardy annual, cropping up every summer when the weather is dry and warm, and most borough engineers put it on the list of things which "never would be missed." The subject bristles with engineering, legal, and sentimental difficulties which are unnecessarily complicated by people who have neither knowledge nor experience of the actual daily working of a system of sewers, who frighten the public by advertisements commencing with a long list of the evils supposed to be due to sewer gas, and wind up by a statement that these can all be avoided by using somebody's patent trap, cowl, disinfectant, or other nostrum at fancy prices.

History of the Subject.

Our modern systems of pipe sewerage are the growth of the fifty years since the Public Health Act of 1848, and very soon after that date Mr. Henry Austin, C.E., Engineer to the General Board of Health, the forerunner of the Local Government Board, made some experiments on the subject, which in 1852 resulted in a few ventilation openings being made into the sewers at the road surface at long intervals with a view to prevent the untrapping of closets, gullies, and overflow pipes from rain-water cisterns. In 1858 Sir Joseph Bazalgette and Colonel Heywood made some elaborate experiments with a furnace in the Clock Tower at the Houses of Parliament, in connection with the main drainage scheme for London. Since that date it has been generally recognised, with the one exception of Bristol, that ventilation is an absolute necessity, because, if provision is not made for the ventilation of sewers and drains they will ventilate themselves in a dangerous manner; and although it is stated that the Bristol sewers are not ventilated, this probably means that no provision has been officially made with that object in view, but, nevertheless, it is more than probable that the Bristol sewers ventilate themselves through the house drains by means of the rain-water pipes and ventilated soil pipes connected to the drains.

Results of Defective Construction.

Ventilation in the past has had to bear the blame of many things for which it was not responsible; that is to say, if a sewer is badly constructed and has not sufficient fall, no amount of ventilation will convert it into a good one, but the ventilation is often blamed for calling attention to the nuisance caused by such a sewer. However well a sewer may be designed and constructed, it may be converted into a sewer of deposit by badly constructed street gullies or by defective or neglected buckets for catching road dirt under the ventilated manhole grids. These defects allow road dirt to have access to the sewer, and wherever this occurs an obstruction is formed, round which the solid parts of the sewage accumulate and so form manufactories of sewer gas at short intervals along the sewer, which get worse and worse during dry weather.

Various Methods.

The most ordinary method of ventilating sewers is by ventilating the manhole and lamphole covers at the surface of the street at intervals, which commenced in the early days at about 300yds. apart, and were gradually made more numerous until some engineers put them as close as 40yds. apart, the idea being that the nearer the approach of the sewer to a continuous open cutting the better. These distances have since been modified until they now vary from 60 to 100yds. apart. During the last twenty years in some towns the street gratings have been closed, and vertical shafts erected against houses have been substituted for them, and in other towns combinations of street surface ventilators and shafts above houses have been used. Other forms of ventilation have been tried, such as connections to factory chimneys, or small gas furnaces, and gaslamps, and systems of deodorising sewer gas by means of charcoal and other chemicals have been tried in addition to or in substitution for the ventilation. As regards

Factory Chimneys

they create a very strong draught, and are useful in the case of a long line of sewer to which there are no connections, such as the Brighton outfall sewer, but otherwise they simply draw air in from the nearest opening; there is great risk of untrapping gullies in their immediate neighbourhood, and the required effect can be obtained by an ordinary shaft without the above risk. The gas furnace ventilators which are an imitation of the action of a factory chimney on a small scale and are supposed to draw fabulous quantities of air out of many miles of sewer, do nothing of the kind, but only draw in air from the nearest openings within a radius of about 100 yards. They are too costly to be applied generally, but are very suitable as special appliances for a very bad sewer which creates a nuisance at a particular manhole.

Deodorising Apparatus.

The application of costly apparatus containing charcoal and other chemicals for deodorising the gas, is of very little use; these are generally merely stoppers of the ventilation, an effect which can be more easily and cheaply produced by plugging the holes in the manhole covers. Ventilation to perform its legitimate work effectually must harmonise with the forces at work within and without the sewer, and it should not be called upon to deal with the foul exhalations from a badly designed and badly constructed sewer, but should be applied to well laid, properly proportioned, graded, and flushed sewers, in order to deal with the watery vapour arising from the surface of the quickly flowing sewage before it has time to stagnate and putrefy; but, however well the sewer may be constructed if the house drains and fittings connected therewith are not also properly constructed and flushed, they intermittently send down putrefying sewage which converts what would otherwise be a good sewer into an offensive one, and for which nuisance the ventilation and the surveyor get the blame.

Sewer Systems.

A system of sewers consists of a number of branch sewers converging into main trunk sewers, and discharging at one common outfall.

At intervals of every few yards along their whole length drains are connected to them on both sides, so that a sewer is a long perforated pipe, the complement or aggregate of a number of drains discharging into it. During periods of dry weather, the time when complaints of nuisance from the ventilators are most numerous, the discharges from the drains are intermittent, the sewage flow is at its minimum in quantity, and in its most concentrated condition. The flow in the sewers is continuous, but varies in quantity during every twenty-four hours, reaching its maximum in dry weather about 2 or 3 p.m., and its minimum about midnight or later according to the habits of the inhabitants of the particular town. Above the flowing sewage the sewers and drains are filled with air, and the sewage is about 800 times heavier than dry air, and more so when the air is charged with moisture, as it always is in a sewer.

What Takes Place in a Sewer.

Take the case of a well-laid pipe sewer, ventilated only by manhole and lamphole covers at the road surface, every house drain connected to the sewer having an intercepting trap fixed upon it. During twenty-four hours the sewer contains varying quantities of sewage, a non-compressible liquid flowing in one direction only, and also varying quantities of air, an elastic or gaseous fluid more or less saturated with watery vapour, filling the space above the sewage and in contact with it. If the sewer is to be self cleansing, the sewage should be travelling down the sewer at the rate of about 180ft. per minute, and at this velocity the friction between the flowing sewage and the air in contact with it almost invariably causes the latter to travel in the same direction as the sewage, but not at the same rate; this motion of the air is retarded by its friction against the crown and sides of the sewer not covered by the sewage and also by every opening into the sewer which it meets with; these in a sewer ventilated by this surface method only, may counteract the effect of the moving sewage, and the motions of the air are feeble, and little better than stagnation, except when there is a good wind. These movements may also be modified by differences in temperature between the sewer air and the outer air, but more especially in dry weather by the watery vapour always rising from the surface of the sewage; this which is a most important factor in sewer ventilation. The greatest complaints of nuisances from sewer ventilation always arise after about a week of hot and dry weather and the nuisance is most pronounced in the cool of the evening or during the fall of the barometer which precedes a change of weather such as a thunderstorm.

How Bad Smells are Caused.

During a hot, dry time the temperature of the outer air at the ground level may range from 50deg. F. up to 75deg. F. or 80 deg. F. in the shade during the twenty-four hours. The sewer air would range during the same period from 52deg. F. to 55deg. F., or a difference of only 3deg. in the sewer as against 25deg. in outer air. The outer air being dry has a great capacity for absorbing moisture, which doubles itself at every 27deg. F. increase of temperature, and dry air at 50deg. F. is 133 times heavier than watery vapour at the same temperature. Therefore the sewer air, although at a lower temperature than the outer air, is, by means of the admixture of watery vapour continually rising from the surface of the sewage, made lighter than the outer air, and consequently rises up every opening that it meets with; and if the temperature of the outer air is greatly in excess of that of the sewer, the watery vapour is immediately dispersed on rising out of the ventilator, and is not so noticeable. But if with the fall of the barometer or in the cool of the evening the temperature of the air at the surface of the road is reduced to the same or a lower temperature than that of the sewer air, the vapour hangs in a cloud in the neighbourhood of a manhole, and so comes in contact with the noses of passers by owing to its meeting with a stratum of air practically of its own temperature and density about 5ft. above the ground. If in such a case as this, in consequence of complaints, the manholes are closed, and grudging permission is obtained for only one or perhaps two shafts for a whole street, similar action takes place at a higher level, but the sewer is not so well ventilated, the friction is greater, and there is considerable risk of some of the intercepting traps being partially untrapped. In the upper length or dead end of a sewer there is not much sewage between the first pair of surface ventilators, and therefore the natural tendency of the air to rise vertically against the crown of the sewer may ventilate that particular length through the summit ventilator in an opposite direction to the flow of the sewage, and thus give rise to the popular delusion that the sewer gas from the whole length of the sewer rises towards the summit. If a sufficient number of shafts are erected against houses between each pair of road surface ventilators, all the road surface ventilators will then be converted into inlets, and the shafts into outlets, and the ventilation will be constant in one direction, because there is always more motion in the outer air at the top of a ventilating shaft, say, 30ft. above ground, than there is at the ground level; an up current is thus created in the shafts, each set of which are practically isolated, and supplied with air by the manhole on the upper side of them acting as an inlet, this arrangement being the only one which harmonise with the several forces above described. The only way to get a sufficient number of shafts to produce this result is to use every house drain as a ventilator by abolishing

---

* A paper read at the annual meeting of the Incorporated Association of Muncipal and County Engineers, held at Cardiff, June 29th, June 30th, and July 1st, 1899.

The Intercepting Trap.

This useless obstruction to the flow of both sewage and air was invented by the late Mr. W. P. Buchan, of Glasgow, after the illness of the Prince of Wales in 1871, and they were introduced into the model by-laws issued by the Local Government Board in 1877, thereby placing an obstruction from 8in. to 10in. deep in the flattest part of every house drain, consisting of about three gallons of stagnant sewage weighing about 30lb., which cannot be entirely cleared with a six-gallon flush, notwithstanding that the improved forms of the trap have from 2in. to 4in. difference of level between the house and the sewer ends of the trap. They are practically cesspools for manufacturing sewer gas, fouling both the drains and the sewers. They do not effect their supposed object of being a safeguard to the houses, as this depends not upon the existence of the trap, but upon the soundness of the drain and its joints, and rapid removal of the sewage; and in these days, when the majority of drains are laid outside the houses, with cement joints, and tested with smoke and water tests before being used, there can be no possible danger in abolishing the traps, and allowing the drains to ventilate the sewers in the natural way previously described, this being the only method by which a sufficient number of shafts can be obtained for the purpose, and the formation of sewer gas prevented. There are other serious objections to the intercepting trap. It is very difficult to get the fresh air inlet into a position away from the doors and windows, where it will not be a nuisance, as every time the drain is used the inlet of the trap is converted into an outlet, and if it is provided with a mica or other valve to prevent this, the intercepting trap may have its water seal partially syphoned by the air. The result of the nuisance from the trap inlets is that many householders promptly close them, and the drain and intercepting trap is more foul than before.

Causes of Drain Stoppages.

If a stoppage occurs in a drain, it is generally at the intercepting trap, and frequent temporary stoppages occur in the trap, which are cleared by the sewage rising in the intercepting chamber until it gets sufficient head to force the obstruction, leaving a coating of putrefying sewage all round the brickwork of the chamber. The householder knows nothing of this stoppage at the time except by the foul air arising therefrom coming through the so-called fresh air inlet of the trap or being forced into the sewers and out through the manholes for the benefit of the public and the unfortunate surveyor. Another serious objection to the intercepting trap is the great waste of water it causes. The experiments by the Sanitary Institute in 1893 (Transactions, vol. 14), showed that even a three gallon flush left a deposit of 27 per cent. of solid matter in the traps at each discharge, and some more recent tests of 100 discharges from an actual drain specially laid from a mill at Stockport by Dr. Porter, the M.O.H. for Stockport, show that a six gallon flush would not clear a 6in. interceptor, and a three gallon flush would scarcely clear a 4in. interceptor.

The flushing of w.c.'s.

Those members of the Association who are water engineers as well as borough engineers will appreciate this point, especially if they have to keep the consumption down to sixteen gallons per head per day, as the author had to do for some ten years in succession. Thorough and real cleanliness should be the great object in view, and in this connection a hand-flushed closet is only a privy, and not a proper and sufficient water-closet as legally defined. A water-closet cannot be kept as clean as it should be unless it is provided with a properly constructed mechanical flush, and, if this is provided and the interceptor abolished, three gallons is an ample quantity of water for the purpose.

(*To be concluded.*)

Builders' Notes.

The Fireproof Partition Syndicate, Ltd. (Cumah-Wright system), have removed their offices from Billiter House to the larger and more convenient premises at No. 10, York Buildings, Adelphi. The company have also arranged for the erection of large works in the north of London.

Messrs. J. Stiff and Sons.—It is with much regret that we have to record the death, which took place on July 19th, of Mr. William Stiff, senior partner in the well-known firm of pottery manufacturers, Messrs. J. Stiff and Sons, of Lambeth. The business will continue to be carried on under the same style by the surviving partner of the original firm, Mr. Ebenezer Stiff, with the assistance of the three junior members of the firm, Messrs. Sydney J., James A. and W. Frederick, Stiff.

A Barry Carpenter's Claim for Compensation.—On Tuesday last week at Barry County Court, before his Honour Judge Owen, a claim was made by a carpenter against the Barry Graving Dock and Engineering Company for £50 for damages for the loss of a finger whilst in their employ. Plaintiff was engaged on March 10th last in planing a piece of wood on a machine which went at a rate of 2,400 revolutions a minute. In doing so one finger of the left hand was cut off and another injured. This was alleged to be due to a slight defect in the bedplate, which had taken place about three months before. For the defence a chargeman named Dunsford and Mr. W. J. Flowers, a foreman, by the aid of a model of the machine, stated that the accident must have happened on account of plaintiff not placing the guard on the bedplate in a proper manner, the latter being a quarter of an inch lower than the other side, whereas it should have been raised to receive the wood on a level after it had been planed. His Honour eventually gave judgment for the defendants, but pointed out that the action should have been brought under the Workmen's Compensation Act. Mr. Bailhache, for the defendants, said if that had been done the action would have been unanswerable, and it was agreed to adjourn the case for future mention before his Honour at the Cardiff Court on a point that the cost of the present action be deducted from the amount of compensation to be paid.

Erecting a Structure without the Requisite Licence. — At Lambeth Police Court, at the beginning of last week, George Davenport, builder, of Warner Road, Camberwell, appeared to answer an adjourned summons taken out by the London County Council, who complained that he, on or about May 12th, unlawfully set up at Kennington Oval a structure to which Part 7 of the London Building Act, 1894, applies, without having obtained the licence required by the Act.—Mr. Chilvers, for the London County Council, said the proceedings had reference to a stand which was intended for the accommodation of spectators at the forthcoming test match between Australia and England. It was intended to accommodate between 400 and 500 people. No application was made to the Council for a licence in connection with the erection of the structure, but the fact that the stand had been erected was brought to their notice, and an examination of the structure was made by one of their surveyors, who was of opinion that it was not fit for the purpose for which it was intended. The summons originally came before Mr. Hopkins, who adjourned it for three weeks upon the defendant giving an undertaking that the stand should not be used in the meantime. Since then the stand had been made in conformity with the Act, and a licence would now be granted. What he wanted to point out was that it was very important that such stands should be put up in a proper way.—Mr. Francis agreed that it was important.—Mr. Armstrong, for the defendant, said he understood that the Council would be satisfied with a penalty of 40s. and 42s. costs. The defendant would be prepared to pay that sum. Upon learning from Mr. Chilvers that he would be content with a settlement of the case on the terms suggested by Mr. Armstrong, Mr. Francis ordered the defendant to pay a fine of 40s. and 42s. costs, and expressed a hope that the stand would be ready in time for the match.

A Builder Charged with Damaging Houses. — At the Moot Hall Police Court, Newcastle, last Saturday week, Arthur Sturt, builder and contractor, was charged, on remand, with maliciously committing damage to certain house property at Gosforth (which he was building for Francis Elliott, of Heaton) to the extent of £50. Mr. Meynell, for the prosecutor, said that Mr. Elliott employed Sturt to build six houses at Gosforth, an agreement being entered into under which Sturt undertook to do the building for Mr. Elliott for £2,080. The agreement contained a clause, the substance of which was that under certain circumstances Mr. Elliott would have power to complete the work and employ labour, &c., at defendant's expense. There were certain complaints about the work, and, on July 21st defendant with a crowbar proceeded to remove certain portions of the building and knock it down, not in the ordinary way, but simply demolishing it. He began with the scullery, and afterwards proceeded to the front of the house and damaged the fittings, windows, sills, &c., doing damage to the extent stated. He smashed door panels, joists, rafters, and other things. He also did damage to two other houses which were built only to the first floor, and for the erection of which he had entered into an agreement for a sum of £660. Mr. Fisher, James Cackett, and other witnesses described the damage, more or less in detail. One of the witnesses stated that Sturt said that he wished Elliott would take him up. They had smashed him, and he would sue them for £1,000 damages. Then he would be all right. The chairman said that the Court were unanimously of opinion that the defendant had had no reasonable ground for acting as he had done, and he would, consequently, be sent for trial at the session, bail being accepted.

Omagh Roman Catholic Church.—Mr. Justice Kenny, sitting in the Record Court, was occupied on July 20th and 21st in hearing an action arising out of the building of the new Roman Catholic Church in Omagh. The plaintiff was Joseph Colhoun, builder and contractor, of Strand Road, and the defendants the Right Rev. Monsignor M'Namee and nine others, constituting the building committee. The plaintiff claimed £3,330 5s. 5d. for work done, services rendered, and materials provided, and also £1,030 9s. 9d. as damages for breach of contract, and in the alternative claimed a like amount for being wrongfully prevented from completing the contract. According to plaintiff, the original amount of the contract was £18,514 1s. 1d., of which he had been paid £15,300 on account. He claimed the balance, with interest from November last, in addition to the damages for breach of contract, as well as £54 11s. 8d. for the plant on the ground. The defendants traversed the various statements in the plaintiff's claim; averred that the amount of the contract was only £17,000; and the plaintiff was now only entitled to £2,366 10s. 2d. lodged in court. They also alleged that this £17,000 covered all the work ordered in writing by the architect, the late Mr. William Hague, of Dublin. Evidence was heard at great length, and his lordship submitted ten questions to the jury, and they found that £801 10s. 11d. and £47 9s. 11d. were due to the plaintiff over and above the sum lodged in court. According, however, to their answer to another question, extra works had been done without authority in writing from the architect, and upon this Mr. Drummond applied for a direction on the ground that the defendant was bound by the final certificate issued by the architect. His Lordship acceded to the application, directing a verdict for the defendants.

Surveying and Sanitary Notes.

A New Street in Leeds.—At last Wednesday's meeting of the Leeds City Council, it was decided to purchase certain property between Briggate and Lands Lane for the purpose of constructing a new street from Albion Place to Briggate. The new thoroughfare will cost £50,000.

Sewage Disposal at Chapeltown.—Last Wednesday morning, Colonel A. G. Durnford, R.E., Local Government Board Inspector, held an inquiry respecting the application of the Wortley Union District Council to borrow £12,100 for the purpose of a main sewer and sewage disposal for the sanitary district of Chapeltown.

The Opening of Clayton Sewage and Outfall Works took place recently. Mr. Asa Briggs performed the opening ceremony. The sewage mains have been laid by Mr. R. Wood, of Bingley, the tanks, &c., being built by Mr. J. Brigg, of Bingley. The tanks are built of salt-glazed bricks, with a stone coping, and are capable of holding 76,000 gallons. After the sewage has heen treated in the tanks, it passes to six large land filtration beds, comprising an area of 6½ acres. The whole works have cost £11,030.

Street Paving in Bradford.—The Bradford Corporation recently received sanction from the Local Government Board to borrow £100,000 for street paving purposes. The streets which it was proposed to deal with in course of time are part of Tyrrel Street, Chapel Lane, part of Market Street, New Ivegate, Booth Street, Hall Ings, Westgate in front of the Infirmary, Charles Street, Swaine Street, and Lumb Lane in front of the Infirmary. The laying of Chapel Lane with wood paving has already been carried out. Tyrrel Street, between Sunbridge Road and Thornton Road, is now in hand, and when the wood paving is laid the tram rails will also be laid for the purpose of bringing the terminus of the Great Horton tramway route nearer the town. Extensions in connection with the various tram routes are contemplated.

Connah Quay Sewerage and Street Improvement.—Mr. G. W. Wilcocks, M.I.C.E., one of the inspectors of the Local Government Board, sat at the Central Buildings, Connah's Quay, recently, to inquire into the application of the Connah's Quay Urban District Council for sanction to borrow £8,000 for purposes of sewerage and street improvement. Mr. Greer, in opening the case on behalf of applicants, stated that of the amount asked to be sanctioned £6,050 was for carrying out a system of sewerage, plans of which had been prepared by Mr. Beloe, of the firm of Messrs. Beloe and Priest, Liverpool. The sum of £378 4s. 2d. was required to pay certain expenses, &c., connected with an arbitration award made by Mr. W. Ambrose, Q.C., the arbitrator appointed by the Local Government Board to arbitrate between the new Urban Council and the late sanitary authority on a certain dispute. The amount of £1,100 was set down for compensation and street improvements, or to give the amounts separately, £1,000 was for compensation which would have to be paid to owners after carrying out the sewage scheme, and £100 was for street improvement. The remaining £471 5s. 10d. was to cover possible under-estimates and various costs incurred. After considerable evidence in opposition to the sewage scheme had been heard the inquiry closed.

County Council Business.—At the periodical meeting of the London County Council last week it was agreed, on the recommendation of the Improvements Committee, to contribute £4,400 towards the cost of widening Cheyne Walk, Chelsea, west of Battersea Bridge, at a spot known as Lindsey Wharf. The work is to be carried out by the Chelsea Vestry. On the motion of Mr. Dickinson, it was decided that the contribution should be made only on condition that the vestry should consent that the method of dealing with the jetty should form the subject of further consideration and report by the Improvements Committee. The Highways Committee recommended, and it was agreed to:—"That the estimate submitted by the Finance Committee for £10,000 be approved; and that the Council do authorise the expenditure by the Highways Committee of that sum for the preparation of plans, specifications, and estimates, and other preliminary expenses, in connection with the reconstruction, for the experimental use of underground systems of electrical traction, of that part of the London County Council tramways between Westminster Bridge and Tooting; and that the committee be authorised to make all necessary arrangements for the purpose above referred to." The Bridges Committee asked the Council to sanction an expenditure of £40,000 beyond the estimate of £74,000 for the acquisition of property required in connection with the rebuilding of Vauxhall Bridge. The committee explained that the excess had occurred chiefly on account of the excessive verdicts given on the claims of the Clothworkers' Company and Messrs. Francis and Co. These verdicts amounted to £46,786, the Council's valuation being £33,000. The cost of reinstating some warehouses on very expensive sites was responsible for the rest of the excess. After protests from Mr. Balian and others the excess was sanctioned.

Masters and Men.

Wellingborough Bricklayers' Strike ended last Wednesday, the masters having conceded the men's demands for 8d. an hour and more favourable working rules.

Danish Labour War.—Last Wednesday the management of the Joiners' Union at Copenhagen adopted, with slight amendment, the draft of a settlement which is the result of the negotiations which have been carried on between the union and the Employers' Federation. It is, therefore, thought that the lockout in the building and engineering trades will soon be terminated.

A Crane Accident.—In Hamilton Sheriff Court on August 1st an application by James Giffen, of 63, Low Glengowan, Strathavon, against Thomas Gilchrist, hotel keeper and contractor, Commercial Hotel, Strathaven, was heard under the Workmen's Compensation Act of 1897. The grounds given for the application were that on June 2nd, 1897, applicant was in the employment of Mr. Gilchrist, and was engaged in driving pipes in connection with the engineering work in the construction of a sewer. He had to convey these pipes to the railway station and place them in waggons with the help of a crane, and while engaged in this work he was struck by the crane. He contended that the railway station and waggons in which the pipes were being placed constituted a "factory" in terms of the Act. Defendant, on the other hand, argued that the case could not come under the Act. The case was adjourned.

The Building Trade Dispute.—The Executive of the Yorkshire Federation of Building Trade Employers met at Leeds on Tuesday last week, and considered the suggestion thrown out at the London Conference that an attempt should be made to settle the disputes still existing in various centres in the county, including Leeds, Hull, Huddersfield, Halifax, and Selby. After a very long meeting it was decided to appoint representatives of the masters to meet the head officials of the London Order of Bricklayers and the Amalgamated Society of Carpenters and Joiners. The master plasterers of Manchester and Salford met the operative plasterers and labourers last week with the idea of settling the dispute caused by the operatives insisting upon an advance of wages—the plasterers of 1d. per hour and the labourers of ½d. per hour. The masters offered the plasterers ½d. per hour advance and a further advance in twelve months, and the labourers were offered ½d. increase and in twelve months another ½d. The offers were refused by the men. The secretaries of the London Order of Bricklayers and the Amalgamated Society of Carpenters and Joiners telegraped to Leeds last week that it was impossible to meet the representatives of the Yorkshire Federation of Building Employers with a view to settling a number of local disputes in the country without the authority of their respective committees.

Engineers in Conference.—A conference was held at the Hotel Metropole last Thursday between representatives of masters and men in the engineering trades in reference to a wages dispute in Mid-Lancashire. Early in the year the men asked for an advance of 2s. per week. The masters, however, promised that they would concede 1s. advance in July if trade remained good. At the appointed time the men claimed the 1s., but the masters alleged that trade did not warrant the advance of even 1s. Mr. G. Clark (Sunderland) presided. The conference which sat for five hours, adjourned at seven o'clock without any decision on the point at issue being arrived at. Another conference was held last Friday, the result of which was that an umpire was selected to determine the question of the state of trade in mid-Lancashire as from April 1st to June 30th last. During the three months in which the umpire is forming his opinion of the state of the trade, an advance of 1s. will be given to the men, and if the umpire's decision is favourable to the men they will receive any arrears of the advance as from July 1st; but if the award is against them they will have to refund any increased wages paid to them.

Engineering Notes.

Municipal Electric Trams at Sunderland.—Messrs. Kerr and Co., of New York and London, have received a contract for the reconstruction of nine and a half miles of line, the construction of three miles of new line, and for twenty-six cars, at a price of £126,000. The system used will be the overhead trolley system, and the power will be supplied from the corporation electric light station. The corporation have bought out the present company for £36,000.

Electric Tramways in the Spen Valley.—Mr. Gerald A. R. Fitzgerald and Colonel Boughey, Light Railway Commissioners, held a public inquiry last week in the Co-operative Hall, Dewsbury, with respect to an application by the British Electric Traction Company for powers under the Light Railways Act, 1896, to construct a tramway from Dewsbury, through the Spen Valley, to Cleckheaton. It was explained that the length of the proposed light railway was about seven and a half miles all told. The gauge was to be 4ft. 8½in., and the method of working was to be by electricity by means of overhead wires on the trolley system. The line would commence at the south-western end of Ravensthorpe, and would pass through that district for a distance a little under one mile seven furlongs seven chains, into the borough of Dewsbury, where it would continue for about two miles. Thence it would traverse Batley to the extent of seven furlongs 4-8 chains, and come out into Heckmondwike, following the course of the Spen Valley from that point. After remaining in Heckmondwike for seven furlongs 1-2 chains it would pass into Liversedge, where it would run for one mile three furlongs 4-5 chains, and, after touching Gomersal, where it would only remain for five chains, it would run into Cleckheaton, where it would terminate after going a further distance of seven furlongs 1-5 chains. It was stated that the tramway would cost £55,631 to construct, or about £80,000 including electric equipment.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
	BUILDINGS—		
Aug. 11	Aldershot—Alteration, &c., to Premises	J. Lazareck	Friend and Lloyd, Architects, Aldershot.
,, 11	Throckley—22 Cottages	District Co-operative Society, Limited	F. C. Charlton, Throckley.

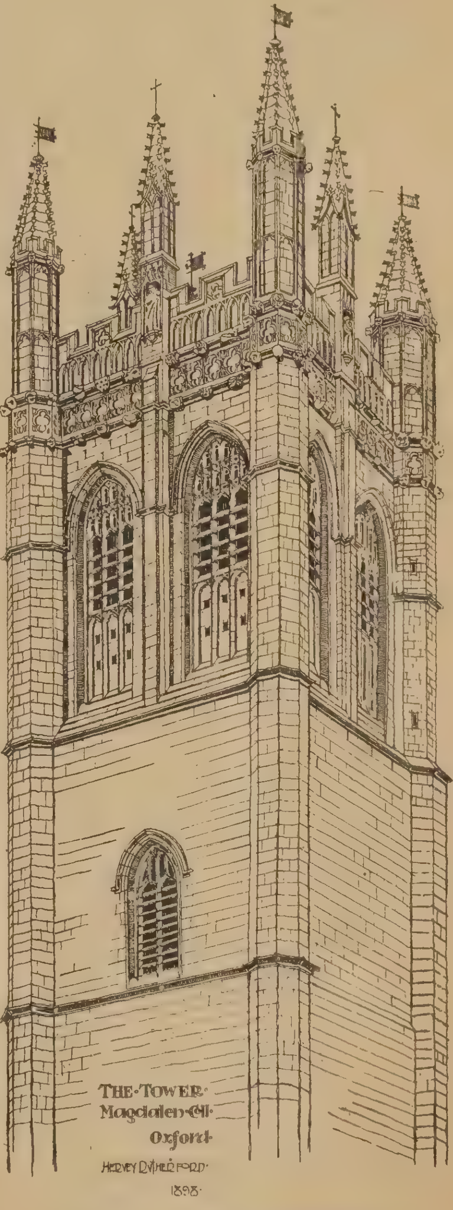
An Architectural Causerie.

Pictorial Design. In the production of a picture many processes are gone through before the completed work stands before the public to be appreciated or neglected, according to the individual spectator's taste. There is first the perception of subject, when a chance grouping of line, a telling effect of light and shade, or accidental combination of colour may catch the eye of the artist, or when a passage from some poet, historian, novelist, or dramatist sets his imagination afire and a pictorial vision rises before his mind, which he longs to realise. Then the sketch is made, and the design of the picture either fixed at once or hammered out and pieced together. Next comes the making of studies, which may be a long and tedious business, but (in modern practice, at least) is often carried out on the picture itself, which in that case generally has the representation of nature as its chief end, success in which means success for the picture. And here the difficulties of technique begin, which are so various as to form an unending chain of pitfalls for the unwary from commencing to completing the picture, with the additional gulf at the end, that if everything be foreseen and calculated for, the result often appears to be mechanical—a manufacture rather than an inspiration—and the charm which should be in every work of art evaporates. Painting is very much a matter of fashion, especially in a country like England, in which the feeling for art is not innate, but has to be carefully cultivated, and the modes of manipulation and treatment of subject, which at one period are all the rage, at other times are treated with absolute neglect. A glance over the art progress of the last thirty years will substantiate this assertion, or a study of the works of members of the Royal Academy in conjunction with the dates of their election. This body may be assumed to contain the most eminent professors of each phase at the time when it was fashionable, and furnishes a most valuable geological section of the variations of professional artistic opinion, from the lowest stratum in which fossils are found, to the most recent, which is scarcely yet consolidated, and does not afford a firm footing. The mode of manipulation should bear some sort of relation to the subject, as should the scale chosen for carrying out the design, for a trivial subject executed on a colossal scale bores the spectator, and a sense of incongruity is experienced when subjects of a highly poetic or religious type are treated in the latest manner now fashionable. There is among certain foreign painters an endeavour to imitate the mannerisms of the earlier artists, by placing scripture incidents amid everyday surroundings. It is forgotten that nothing is so sickening as the imitation of *naiveté*, and that even in the times from which they appear to take their inspiration it was not the custom to dress all the personages in costume which was then strictly modern. One often finds details of costume which were archaic at the time the picture was painted, in the midst of scenes apparently treated in the most realistic manner. The design of all pictures must be treated from one of two standpoints, either what may be termed the photographic or the panoramic. In the former the interest of the picture is focussed upon one point, and it is in this that the composition centres, and towards which the attention is directed, by all means which the painter has at his command. In the latter the interest has to be more evenly spread over the surface, so that the eye may travel with satisfaction from end to end. This form is that which is most suitable for decoration, the other being specially suited for easel pictures. It is unusual for an artist to be equally at home in both forms, the qualities of mind required for success being so different. As has been said the easel picture requires concentration of interest and effect upon one point, and, therefore, local exaggeration, while in the panoramic greater general grasp is required, the balance of masses and the spreading of the design in colour and line over the space to be decorated implying greater mental exertion. Another difference is to be found in the value of manipulative dexterity, which is of immense importance in the easel picture, but in decorative painting is much less necessary than the mental processes which have gone before the actual execution, and which guide the hand and eye to the production of works of great excellence; and while the easel picture may depend wholly upon manipulative dexterity for its interest, the decorative painter is forced to lay greater stress upon qualities of design, which may be so arranged that special prominence is given to one group, while others are kept in the background. The true decorator will choose the quality most in harmony with his intention, or with the surroundings of his work, or which may serve to correct them and bring everything into harmony. These special qualities may be suavity and beauty of line, beauty and impressiveness of silhouette, light and shade, arrangement of mass or arrangement of colour. It is not meant that any of these are destructive of each other, but that one or other being made prominent the remainder must necessarily be subordinate, for in all decorative art at all events there must be a governing idea, and it is as useless to attempt to combine two or three on an equality with each other as to produce a picture in which landscape and figures shall be equal in interest. All pictorial art depends upon sacrifice and selection, and even if it were possible to so paint as to make the spectator equally interested in the landscape and the figures contained in it, the result would only be mental confusion, a fall to the ground between the two stools. From the purely pictorial standpoint the form of composition and treatment should be selected to suit the mental impression it is desired to produce in the spectator, which may be suggested by the literary subject and may not. For instance, a picture by which the artist desires to excite the emotion of pity may contain uglinesses of form and delineations of squalor and muddiness of colour—so long as they are not enough to cause disgust—which would be quite out of place and offensive in one of which the subject was youth and spring. Again, if the subject is the relation of certain lines to each other, or contrasts of colour or tone, delicate or forcible, it is evident that absolute individual truth to either model or landscape is beside the question. The model, or the natural scene, is but the means whereby the poet, the maker, strives to set forth his vision, and the question is, is his mental conception clearly set forth, and are all parts of the picture in harmonious relation to each other? not—is it like individual nature? Looked at from this point of view realism and idealism no longer fight—that is to say, that every form of art is idealistic in so far as it is art at all. It has been contended that art lies solely in treatment or manipulation. It is true that a mean and sordid subject may be thus ennobled (and most of the subjects of modern life are mean or sordid), but the visions of beauty which the true artist beholds and strives to realise with the imperfect means at his disposal do not become art by his treatment of them, for his rendering lags far behind his vision, and the style which is considered to distinguish his productions is but the mode by which his personality strives to overcome the difficulties of expression. As with fainting steps he strains up the steep, difficult path, the higher he rises the rarer is the air, and he catches at every aid which may enable him to approach the summit of his desires. Design in a picture is one of the most valued and valuable aids to him in his struggle.

S. S. G.



DRAWN BY J. HERVEY RUTHERFORD.

Magdalen College, Oxford. Magdalen College is one of the most interesting college buildings of Oxford. It was built between the years 1474-1480, and has many fine features, notably the "Founder's Tower," with its beautiful oriel. This tower, illustrated above, is one of the most graceful of Perpendicular towers, and is about 145ft. high. Our illustration is from a sketch by Mr. J. Hervey Rutherford. This sketch was one of the set which took the Pugin Studentship prize at the Royal Institute of British Architects in January last.

"One Mile from London."

There stands, at the junction of the Exhibition Road, South Kensington, with Kensington Gore, a milestone bearing the now curious legend, "One Mile from London." The wayfarer who passes this crowded spot, where all day long the omnibuses make a continual procession, may readily observe this significant landmark, standing as it does, conspicuously against the dead wall that encloses Lowther Lodge, and the sight of it will be well calculated to arouse many thoughts in his contemplative mind, for it bears witness to the once existing notion that London began or ended, on its western side, at Hyde Park Corner, whence this relic is distant one mile. In those days, when the great Duke of Wellington was still living and residing at Apsley House, whose vast dingy bulk is still prominent at the Corner, that great building was, indeed, known as "No. 1, London," and was a convenient object at which to point when showing country cousins where London ended and the country began. There were no suburbs, as we in these latter days understand them; and once past Hyde Park Corner, the traveller of nearly two generations ago plunged into the country, past the village of Knightsbridge, and what was practically the country town of Kensington. As a matter of fact, the Kensington of that era was a great deal more countryfied than, say, Guildford now is, and fields and market gardens stretched away to the horizon where passionate Brompton and æsthetic Chelsea are now reckoned within the circle of fashionable London. It was, of course, the Great Exhibition of 1851 that first gave an impetus to building here, and drove the market-gardeners away. The village of Brompton was discovered by daring travellers from Mayfair, and land-speculators began to see that crops more profitable than cabbages or other domestic vegetables could be raised on these marches of the metropolis. Among them, Cubitt arose, and towering head and shoulders above his brother speculators, builders, and contractors, banished the broccoli to greater distances from London's ever-extending borders and pegged out huge building estates among the peas and the potatoes. Thus arose that once-typical South Kensington thoroughfare, the ineffable Cromwell Road, little less than half a century ago. That road, and its near neighbour, Exhibition Road, and Queen's Gate, exhibit the apotheosis of stucco. There are many roads, with houses more or less "palatial" in this neighbourhood, "one mile from London," but perhaps the culminating examples are the immense houses, one on either side of Albert Gate, which, when they were first built, were called the "Two Gibraltars," because it was thought they would never be taken. One became the residence for a time, before his downfall, of Hudson, the "railway king"; the other has long been the French Embassy. Happily, the era which built these dreadfully commonplace houses has passed. London has absorbed the early nineteenth century rural district once distant one mile from it, and it has been left for the last few years to see the compo porticos and pallid brick elevations of many of the once-admired Queen's Gate houses rebuilt in red brick and stone, by architects of the first reputation. Early and Late Victorian rub shoulders here in this quarter of museums, art galleries and mansions, and will serve to point a moral and adorn a tale for coming generations. Let us hope that not all the buildings of the Cubitt era will disappear. Let them remain, in part, as an example and a warning. C. G. H.

On Reflection.

The Wicked Restorer.

In last week's "Church Gazette" there is an interesting article on "Unrestored Churches," the writer of which declaims in vigorous style against the evil deeds of those who have taken in hand the restoration of our country churches. The author hails from Wessex, where he doubts if a single unrestored church is now to be found, and he implies that in every case "restoration" has been synonymous with desecration. "According to the view of the restorer," he says, "nothing can be worthy of preservation since the perpendicular period and little then, and because he does not know what the original builder intended he sets up what, out of his illimitable ignorance, he supposes they might have designed." Is it really so bad as that? We all know the excesses to which the Gothic revivalists of a past generation were led in their unrestrained enthusiasm, but in these days our architects have learned a little discretion. Our author certainly quotes some very bad cases, but he generalises somewhat rashly. Not every church restorer is a Vandal. While much of the work that has been done in the past is utterly indefensible, there are happily not wanting examples of restoration undertaken in a conservative and reverent spirit. After all a church does not fulfil its highest uses when it is merely a picturesque ruin, and the architect who, by the wise application of his art, arrests the natural process of decay, and preserves the fabric as a house for Divine worship as well as an interesting memorial of the past, is deserving of the thanks of the community: provided always his work is conceived and carried out in a spirit of reverent regard for the intentions of the original builders.

Electric Trams for London.

The advantages of electric traction over other kinds of mechanical power, and to an even greater degree over horse-power, have been by this time pretty clearly demonstrated. In many provincial towns, as well as in a great number of the most important Continental and American cities, electric trams have long been established and have proved completely successful. In this as in so many other matters London lags behind. The problem of the best system of traction is, it is true, a specially difficult one in London, but it is also specially urgent. The housing problem which bears so heavily upon the poor, and to a greater or less degree affects us all, makes it desirable that workmen should be enabled to live as far from the crowded centres of London life as possible. With cheap and rapid means available for transit to and from their work, larger numbers of workmen would be enabled to live in outlying districts where rents are cheaper and the air is purer. An electric tram might safely travel at a much greater speed (at any rate, in the less crowded streets) than the horse trams, and there is every likelihood that, if properly managed, the fares might be lower. We are glad to see that the London County Council have just taken the important step of inaugurating an electric tramway between Westminster Bridge and Tooting. The step is regarded as an experiment, but we have no doubt it will prove so successful that there will be no return to horse traction over this particular six miles, and that in other districts, as the tramways come under the control of the County Council, the same system will be adopted. The improvement of facilities for locomotion in London becomes every year a more urgent matter. Apart from the housing question, which is so closely dependent upon it, the increasing number of persons of all sorts and conditions who find it necessary to make their way to the City in the morning and return to their suburban homes at night, makes it more and more incumbent upon railway companies and tram and bus proprietors, to bestir themselves in the public interest. If, as we anticipate, the Westminster-Tooting experiment proves successful, an important step will have been taken in the direction of securing a better regulated system of locomotion for the metropolis.

The London School Board and Housing.

The housing problem in London is a sort of nightmare which troubles every public authority in turn. The London School Board is the latest victim. The Board wished to get rid of the problem by ignoring it, but that policy has proved a signal failure. We cannot pretend to much sympathy with a body which has brought its troubles upon itself by its evasion of a clear duty, though we sympathise with the ratepayers who will have to pay, probably, an enhanced rate. The Board has been under a statutory obligation, whenever it pulled down houses for the purpose of building a new school, to rehouse the displaced population in all cases where more than twenty houses were demolished at one time. By the simple expedient of not removing more than nineteen houses from a particular site in any one year, the Board has evaded its obligations in this matter. These disingenuous proceedings have now received a check. By an amendment to the Standing Orders, which has just passed the House of Commons, the Board will be obliged in future to find suitable accommodation for tenants of houses "liable to be taken" for the Board's purposes, as well as of houses actually demolished, and, in addition, it is called upon to build houses for a population equal to that it has displaced during the last five years—probably about 3,000 persons. It is possible, therefore, that we shall shortly see the School Board embarking—not willingly, but of necessity—in the work of building model dwellings. The Board, however, is hardly the authority to undertake such work itself with much prospect of success; its members have had no experience in this direction, and its Works Department is too small for such extensive operations. This is one of the cases in which the employment of a contractor is likely to answer better than the employment of direct labour, unless, indeed, the work is handed over to the Works Committee of the County Council, as one of the members has suggested. In any case it is satisfactory to know that the work of rehousing will no longer be neglected as it has been in the past. The attitude of the School Board seems to have been: "We are elected to look after the education of the children, therefore let us not trouble about anything else." But in the present acute state of the housing problem, and the absence of any large and statesmanlike proposals for dealing with it, it is the duty of every public authority to take upon itself some share of the burden. At any rate the problem is not to be solved by being shirked.

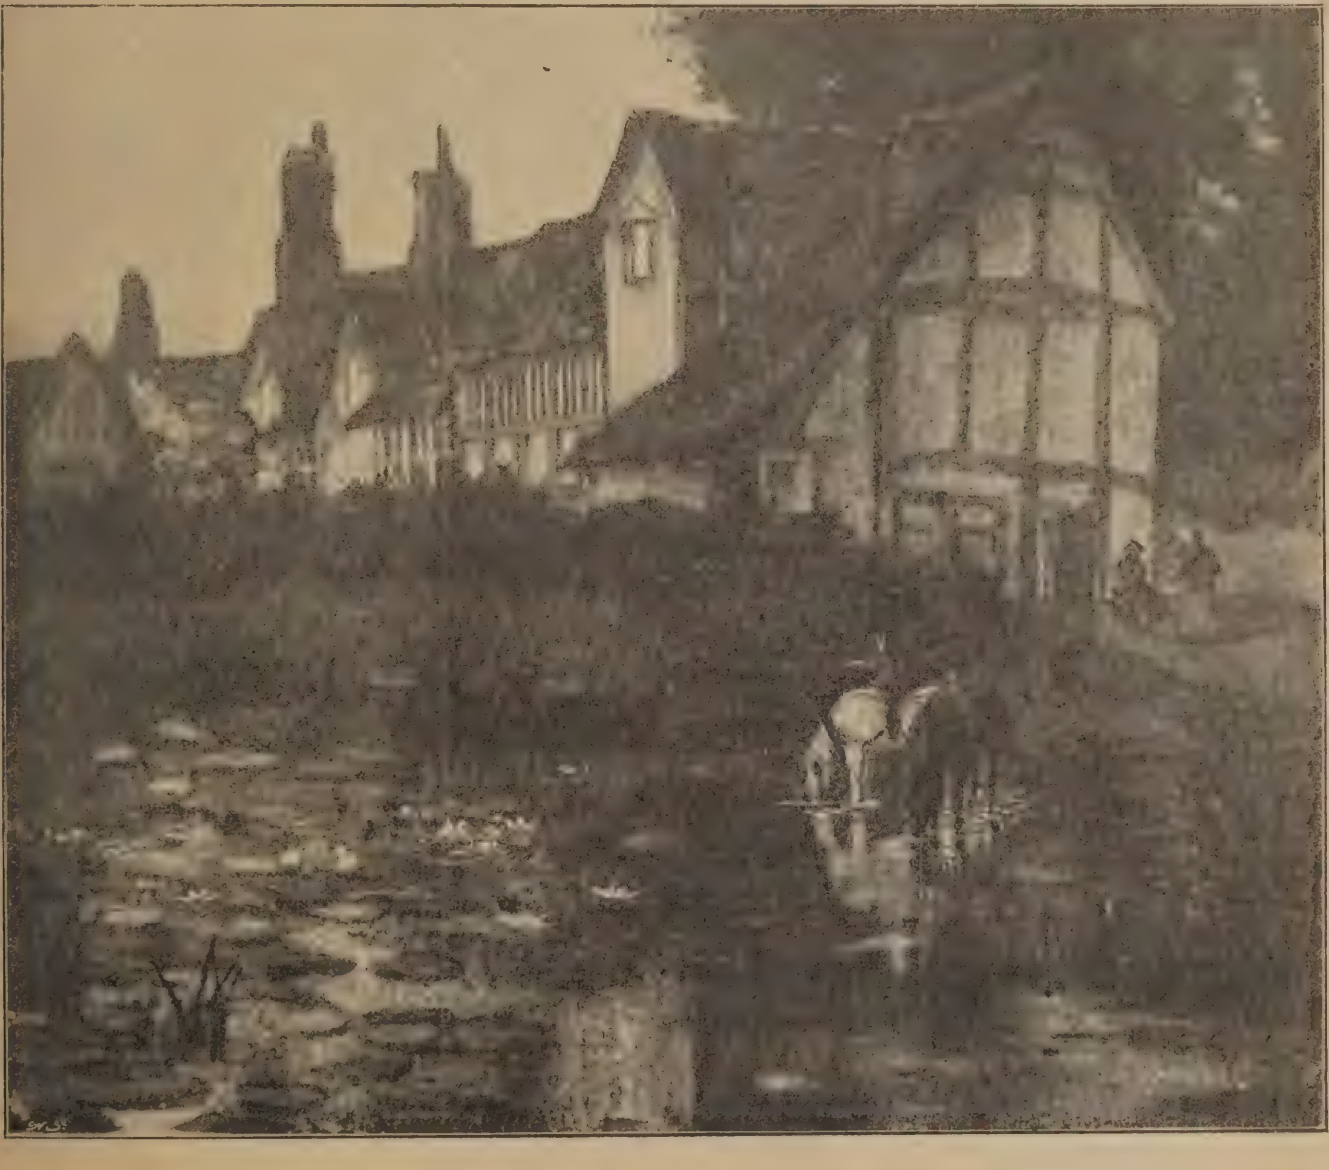
HALF-TIMBER HOUSES.

THE illustration appearing on this page is of a very picturesque group of old half-timber farmhouses, roofed with thatch, situated a few miles from Hemel Hempstead. These homes, suggestive of peace and contentment, are similar to many other half-timber houses in the locality. Mr. William Aikman's water-colour drawing, from which our illustration is taken, shows this well-known designer of stained glass as a most capable draughtsman.

Perhaps what is most pleasing about these houses is their simplicity ; the panels of plasterwork are large, and separated by fairly large timbers. It generally happens that the more simple specimens of this most interesting style of building are ignored, and attention is directed only to such buildings as Moreton Old Hall, the well-known houses at Chester, and Trewern Hall in Montgomeryshire, where the panels are small, and loaded with small, and often carved, woodwork. Although this more minute work is more interesting than the plainer kinds, these latter are worthy of most careful study. It is a very common thing for the woodwork to be entirely plastered over, but even then the examples should not be lightly passed over, for they often present studies of good proportion and picturesque grouping of parts. Proportion and grouping are too often absent from modern work in this style. It is stated that there are no cottages in England more than 500 years old, and that those of undoubted antiquity which still remain owe their durability to the fact that they were built mainly of oak. The picturesque irregularity of many of these groups of cottages along the wayside is due to their being built in accordance with a statute of Queen Elizabeth's reign, which ordained that every cottage, with some few exceptions, should have a full portion of land on all sides.

Pure half-timber work seems now to be falling into desuetude, the only use being for that horror of modern suburban buildings, the half-timber gable, the remainder of the building being generally entirely of brick or stone. By using half-timber in this way a building becomes a medley most distressing to the eye. Much of this usage is no doubt due to the London Building Act by-laws, by which it is ordained that practically no half-timber must be used, except in dormers and such like. One can readily appreciate the wisdom of prohibiting thatch in order to obtain both safety from fire and more sanitary roofing material, but there seems to be no good reason for the prohibition of pure half-timber work, considering the number of fire-resisting materials on the market and the present superior methods of construction.

An article, written by Mr. W. A. Mellon, upon half-timber houses appeared in our issues for December 15th and 22nd, 1897, and should prove of considerable service to any one interested in this method of construction, and desirous of making some study of it.



HALF-TIMBER FARMHOUSES AT HEMEL HEMPSTEAD. FROM A WATER-COLOUR DRAWING BY WILLIAM AIKMAN.

WITH GREEK BUILDERS.

I. — ARCHITECTURAL PRACTICE AND BUILDING MATERIALS.

By JOHN A. MARSHALL.

> *"The school of the Grecians still remains open, my friend—years have not barred up its doors."*
> —Goethe.

LET us enter, then, yet once again, for no other art is so full of healthful teaching, especially for these days of restless striving, when the encroachments of science—as killing as the canker to the rose—are eliminating from our architecture all that is most valuable. Breadth, dignity, permanence—the outcome of simplicity and restraint—are qualities rarely met with in modern work. It is indeed refreshing to look at a block of Pentelic marble as fashioned by the Greeks. How massive the stone! what tenderness in the detail! while the glittering play of light on its crystalline surface shows the material to be worthy of the workmanship.

The value of permanent strength, combined with architectural beauty, for which the buildings of ancient Greece are pre-eminent, is due to the simplicity of the construction, and to that sense of "fitness and measure" which distinguishes all Greek achievement. It should also be borne in mind that for centuries the Greek architect worked under what may be termed a healthful restraint, for his efforts were mainly directed to perfecting the proportions and details of unalterable types. This restraint, it may be mentioned, was in a measure enforced by the isolation of the Greek communities, and by the national character of their religion. These remained practically unchanged from at least the time of the Homeric poems to the conquest by Philip of Macedon. 'Tis true that during the century preceding the last-named event the philosophers had sought a higher teaching than that afforded by the popular mythology, and the faith in the Homeric Pantheon began to wane, yet, notwithstanding this, the religion remained essentially national.

When the independence of the Greek States was threatened by Philip, the individual, rather than the State, was fast becoming the unit of social life. The orator Demosthenes clearly saw this, and, in one of his attempts to rally the Athenians to a sense of their public duty, he brings the fact home to them in a very striking passage. "In former times," he says, "the State herself was wealthy and flourishing, and no individual was raised above the multitude. Is poof wanting? Whoever knows the style of house which Themistocles had, and Miltiades, and the illustrious of that day, perceives it to have been no grander than that of the multitude, while the public structures and edifices are so magnificent and beautiful that room is not left for any succeeding generation to surpass them: Yonder, gateways, docks, porticos, the Piræus, in fact all the buildings by which you see the city adorned. Now, each of your statesmen has a private fortune so immense that some of them have built their houses more splendid than many public edifices, some have bought up a quantity of land, more than all you in the Court have amongst you, while as to the State buildings which you put up and whitewash, I am ashamed to say how paltry and miserable they are!"

The loss of Greek independence was followed by the introduction of foreign cults, and the spread of science; new creeds were established, while unbridled scepticism flourished. The practice of architecture became an ostentatious display of skill, which the hand of Time has long since obliterated, but the works so much admired by Demosthenes still remain.

In the republics of Greece the construction and management of the public buildings was undertaken by the State, each city being usually an independent community, having no political union with its neighbours. It may be well, however, to bear in mind that the district of Attica formed an exception; there the various cities and townships constituted a single state, and recognised Athens as the seat of supreme power.

To direct the public works, an official building committee, termed the *epistatæ*, was appointed for a term in each city. This committee was assisted by a superintending architect, who, it should be noted, is to be distinguished from the architect of the building. Thus Plutarch tells us that the sculptor Phidias was appointed by Pericles to superintend the public buildings of Athens, and that he had the direction of everything, and all the artists received his orders, although the Athenians had other eminent architects and excellent workmen; but we must not infer from this that the architects of the Parthenon and the Propylœa were not entirely responsible for their works. In all probability, the supervision by Phidias—in the case of the Parthenon—was limited to the requirements of the cryselephantine statue and the Panathenaic frieze.

To superintend the building of the Erectheion, a committee was appointed (in 409 B.C.), consisting of five members, including an architect named Philocles, of Acharnæ. The architect of the building is not known.

It was the custom, as in these days, to entrust the erection of a building to contractors, though occasionally the State dealt directly with the workman, an arrangement adopted for portions, at least, of the Erectheion. Very large works were sometimes divided into sections, each section being let to a different contractor, or only a part of the work was contracted for at a time. Thus for a large temple at Lebadea, in Boeotia, a contract has been found which refers to a portion of the stylobate only.

The materials for public buildings were mostly supplied by the State, the principal quarries being under its control. For Athens the main sources of supply were the marble ranges of Pentellicus and Hymettus.

The Pentelic marble was the most durable, and after the Persian wars it was almost exclusively used for the buildings on the Acropolis. The quarries from which it was obtained may still be seen, though doubtless their original aspect has been somewhat altered by the Romans, who used them largely. They are approached by a steep ascent, roughly paved with transverse blocks, so that the stones could be brought down to the valley on wood slides. The blocks were probably first scalped into shape at the quarries, to reduce the labour of transit.

The marble of Mount Pentellicus is composed of nearly pure carbonate of lime, though interspersed here and there with veins of schist. It is very hard, and of a coarse crystalline texture, which makes it difficult to work. When being roughed down, it emits sparks, and the tools are quickly blunted. The action of the weather on the surface eats away the softer veins of schist, leaving the hard parts standing out; this effect may be seen in the sculptures from the Parthenon. The mellow tint which this marble assumes with age is due to oxidisation.

Other quarries were situated in the Peiraic peninsula, from which a coarse limestone was obtained for ordinary work and foundations. A dark limestone from Eleusis was also used for special purposes, and marble from the islands of Paros and Naxos for roof tiles. When marble was not used the coarse stone was sometimes coated with a very fine hard stucco, made of lime and powdered marble, which took by polishing a surface similar to that of marble. The stonework for the temples at Cornith, Aegina, Delphi, and Olympia was so treated.

At Delphi (530 B.C.), according to the contract, the temple was to have been built entirely of rough limestone from Mount Parnassus, but the contractors, at their own cost, made the columns for the front of white Parian marble, the rest of the work being covered with stucco.

Another remarkable instance of the use of different kinds of stone in the same building is the temple at Phigaelia. Here the walls, columns, and entablature were built of a grey compact limestone, not coated with stucco (see a cap in the British museum), while the ceiling beams, and lacunaria, the capitals of the interior, the sculptures, the tiling, and the guttæ on the soffit of the corona were of marble. Professor Mahaffy tells us that the pillars of this building have become curiously wrinkled with age, caused by the grain of the limestone running across the flutings; the ground colour, he says, is a pale greyish blue, but the lichens which invade the stone have varied the fluted surfaces with silver, with bright orange, and still more with a delicate rose madder.

For the arsenal of Athens, at Zeia (346 B.C.), we learn from the specification prepared by Philo, the architect, that the walls were to be of Peraic stone, which could be quarried at hand; the columns inside, and the thresholds and ceilings of the vestibules, were to be of Hymettic stone; while for the caps of the columns, and the casings and lintels of the doorways, Pentelic marble was to be used. There are no remains of this building, but the plan can be made out from the inscription. The length was no less than 400ft., and the width 55ft. The building was divided into three aisles, by two rows of columns. The side aisles were reserved for the storage of tackle, while the central aisle, which had a doorway at each end, was used as a thoroughfare.

In considering some of the structural details of Greek buildings, it will hardly be necessary to remind the student that, to receive the peristyle and cella walls of a temple, a raised platform, or stylobate of masonry, was always constructed, and for this the site had generally to be levelled or made up. Thus, for the archaic temple on the Acropolis at Athens, close to the Erectheion, the rock was cut away for the south-east angle of the stylobate, but on the north-west an artificial foundation of solid masonry was raised about 10ft.

At Aegina and Delphi the platform was extended considerably beyond the area occupied by the temple, so as to form in each case a spacious peribolos. In the former, the platform is partly on the rock and partly built up of large stones; it was paved with two thicknesses of square slabs. At Delphi, the paving of the substruction is in part supported on piers over 6ft. in height, which are connected by walls, forming a network of cells; the whole is enclosed by a massive retaining wall of closely-fitting polygonal masonry, against which winds the "sacred way," made familiar to students by the French excavations. The student may also be reminded of the allusion in that delightful play, the "Ion," of Euripides, where Creusa leads the old man up the winding path to the temple.

The substruction of the Pantheon is well-known, on account of the controversy respecting its date; and the bastion-like projections for the lateral compartments of the Propylœa will readily recur to the mind.

When the site was a natural plateau of rock, the area covered by the temple was not, as a rule, levelled throughout, but merely around the stylobate, and continuous trenches were sunk for the foundation, leaving the ground within the temple undisturbed, where it did not interfere with the bedding of the paving. At Assos, in the Troad, for instance, the volcanic rock on which the temple stood was found in places nearly flush with the floor, and is supposed to have been covered with stucco. At Segesta, the red limestone rock in the cella protrudes above the level of the stylobate paving, but the cella was never built, and the ground around the temple had not been levelled, only the space on which the peristyle stands. The situation of this ruin must be very impressive. A description of Goethe's, in a letter dated 1787, almost takes us to the spot. "At the highest end of a broad and long valley, it stands on an isolated hill—surrounded, however, on all sides by cliffs; it commands a very distant and extensive view of the land, but takes in only just a corner of the sea. The district reposes in a sort of melancholy fertility. Flowering thistles were swarming with countless butterflies; wild fennel stood here from 8ft. to 9ft. high, dry and withered, of the last year's growth. A shrill wind whistled through the columns as if through a wood, and screaming birds of prey hovered around the pediments."

The Early Doric temple at Corinth is another instance where the area covered by the building had not been reduced to a level, nor were the foundations of the peristyle continuous, but a distinct bed was sunk in the rock for each column, and trenches were sunk for the walls. The lowest step of the stylobate was hewn out of the rock.

Before closing this section of our subject, we may refer to Pliny's account of the preparations for supporting the great Temple of Artemis, at Ephesus. He says:—"A marshy site was selected, in order that the temple might not suffer from earthquakes; and that the foundations of so vast a pile might not have to rest upon a loose or shifting bed, layers of trodden charcoal were placed beneath, with fleeces covered with wool on the top of them."

When Mr. Wood excavated the site some years ago, he was naturally curious to know if Pliny's statement could be verified, but, unfortunately, he was unable to dig down to the necessary depth, as the excavations were flooded; he, therefore, bored through to the natural soil in several places, and found it to be alluvium, composed of sand and water-worn stones. On the top of this was a layer, 4in. thick, of a substance resembling putty or fine mortar, then a bed of charcoal 3in. thick, and again a layer of mortar 4in. thick. On this platform the foundations of the archaic temple were built. The stylobate of the latter temple was raised some 7ft. 6in. above the floor of the early temple, and the columns were built on piers stiffened by connecting walls, so that the weight would be evenly distributed.

Although Pliny does not mention the use of piles, yet we cannot be certain that they were not employed here, as in later Roman times; and on this head we may be permitted to quote "Vitruvius," who says: "If the ground be loose or marshy, the place must be excavated or cleared, and either alder, olive, or oak piles, previously charred, must be driven with a machine as close to each other as possible, and the intervals between the piles filled with charcoal. The heaviest foundation may be laid on such a base."

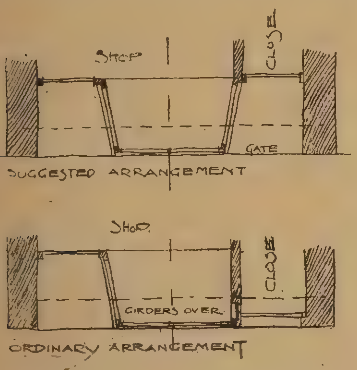
(To be continued.)

SHOP FRONTS.*

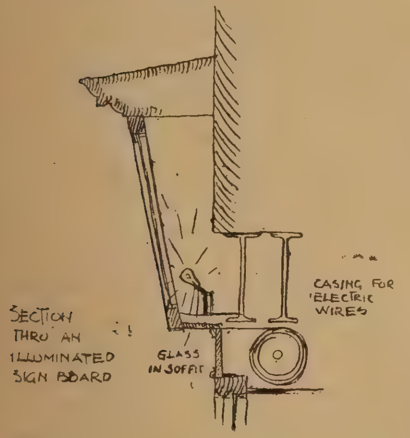
By JAMES LOCHHEAD, A.R.I.B.A.

(Concluded from page 10, No. CCXXXV.)

WHEN on the subject of oriels I have illustrated a simple means for treating a shop window with close adjoining in this wise: Where instead of the usual method of carrying out the brick dividing wall to the face of front wall, a convenient and attractive window, and at the same time a shortened "close," can be obtained by repeating the angle of shop door ingoing on the opposite side of window.



TREATMENT OF FRONT WITH CLOSE ADJOINING.



CASING FOR ELECTRIC WIRES
SECTION THRO' AN ILLUMINATED SIGN BOARD
GLASS IN SOFFIT

In addition to the architectural evils and difficulties incumbent upon the introduction of large plate glass fronts, other disturbing influences force themselves on one's notice, one of which is the necessity of protecting this large surface from the sun by making provision for sun blinds. This, however, in one of its solutions involves a consideration of the signboard, about which a great deal remains to be said. The tasteful display of the vendor's name is not so much a matter of consuming interest to that individual as the attractiveness thereof, still the architect can do much to render the signboard, as one of the "trifles which make perfection," at once attractive and artistic. It is true that in many cases there is not much inducement to bestow labour on this adjunct, when we see even the most respectable of them at times totally obliterated—and no inconsiderable part of the building as well—by huge posters testifying to some clearance sale and marvellous bargains, a feature which, if it must be tolerated, might also be considered worthy the architect's consideration.

BLIND ROLLER
INCANDESCENT ELECTRIC LAMP MAY BE BEHIND IF SIGN IS TRANSPARENT.
PAVEMENT

Why should a signboard be tilted as we so often see it? In some cases this is no doubt due to a constructive expedient to support oriels or some projection over, but the alleged advantage to "the man in the street," in so far as "he who runs may read," is questionable, as is also, to my mind, the appearance. Standing on the opposite side of the street, lettering upon a flat surface is as legible as on an inclined plane, while from the edge of the nearer pavement the one serves its purpose as efficiently as the other, in addition to which other means of announcement to the close observer could be devised, to which I shall refer.

It is a customary practice in the before-mentioned instance of a series of shops to have the board extending right along over closes and shops alike without break or interval, except by the ludicrous line of demarcation afforded by the joinings of colour favoured by the respective vendors. It is more satisfactory to let each shop sign stand for itself, and begin and end over the daylight, forming a frame wherewith to contain the desired announcement.

Of course, the boards must of necessity extend the full length, but in this case also it stands for itself, and does not involve any other feature. I may explain my meaning in this connection by alluding to a signboard at the Trongate, grained an impossible mahogany, where the shop-keeper has made everything to match by converting the stone cornice above into the same extravagant material! The wooden sign is almost a *sine quâ non* where iron beams come in behind, with a few exceptions in the case of glass, mosaic, modelled plaster, or the skeleton sign before referred to. The reference to glass recalls one method of making an effective announcement by means of an electric light behind a glazed signboard, upon which the transparent letters in red were shown up against an opaque background. Modelled plaster in the shape of some flat decoration has been used successfully in America; it enhances the appearance of the window and emphasises the name—which, by the way, ought to be executed in good lettering—an item not above the architect's attention.

PLAN OF HINGED INGOINGS FORMING OUTER DOOR
PLAN OF FRONT

I referred to the necessity for announcements to the close observer; this has been successfully accomplished by means of an improvement of the old brass plate arrangement over the stall board—which, by the way, should be kept back from the line of front out of the reach of people's feet. By putting a plate inside the window immediately behind the same, an easily read announcement is provided, damage to goods by condensation is avoided, light goods are kept a desirable distance back, and a blind roller can be obtained underneath.

This provokes a return to the subject of blinds. The most common consists of a roller behind the signboard, part of which is detachable, and supported when extended upon adjustable arms attached to the wall. In Neulands "Carpenters' and Joiners' Assistant" a diagram of a shop front is given, which likewise affords a suggestion for a treatment of shutters which might be used in connection with the common vertical Venetian blind arrangement. Here the blind after having collapsed, goes under the sill of the window.

The same diagram also indicates an idea for utilising the side lights of the entrance as external doors—not a very practical arrangement, however.

These details are, however, principally applicable to fronts entirely of plate glass, and would not call for consideration in every case, and as I have already mentioned the possibility of bettering existing conditions by giving each particular trade a front to suit its own particular requirement, it remains to be determined how best this can be done.

The above remarks might apply to a front such as would be desired as suitable for a draper, grocer, or others who exhibit wares which might be called imperishable, when compared with those of the butcher, fishmonger, poulterer, and so on. The proper requirements in the latter trades are perhaps given effect to in England more than in Scotland, and the examples I give might be called typical English examples. It is possibly a misnomer to speak of butcher's shops as having a front—for they are almost absolutely devoid of such, being for the most part open, except for the bulk consisting of built seats supporting marble slabs for the exposure of the food. An ornamental iron grille occasionally spans the upper part of the front, sometimes replaced

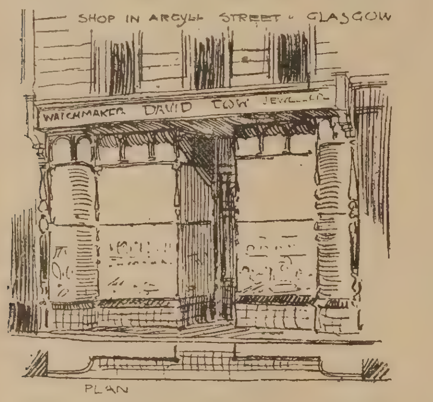
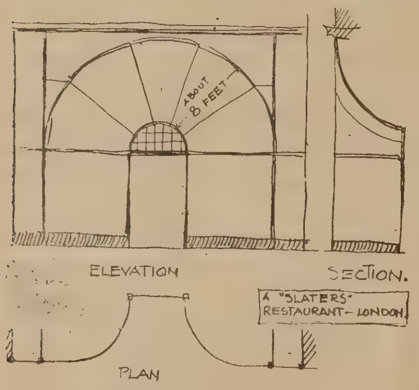
by a glazed screen from a height of 8ft. or 9ft., while protection is afforded by a curtain, which revolves round a drum behind the signboard.

Considerable similarity exists between these and the front of fishmongers' or poulterers' premises, which likewise possess the bulk supporting, in this case, a seat extending back some 8ft. or 10ft., while, overhead, hanging bars for game take the place of the iron grille. That these are capable of some distinguishing and artistic treatment will hardly be questioned, and even in Glasgow we have the admirably suitable premises of Messrs. Sawers to make the possibility more universal.

It is, perhaps, far-fetched to term jewellers' wares perishable, but the necessity for some provision in order to guard against theft has accounted, in one instance at least, for rather a unique treatment singularly appropriate to these shops. This consisted of an ordinary plate glass front, with a very light but exquisitely wrought iron grille the full size of the window (inside), except for an oval-shaped opening for unobstructed view; this grille, besides being pretty in itself and a safeguard against theft, served a good business purpose in so far as it caused more people to look in from the idea thus given of the great value of the goods. In Glasgow, the latest examples of jewellers' shops are resplendent in circle corners, turned balusters, and bevelled plate, not at all such an artistic means to an end.



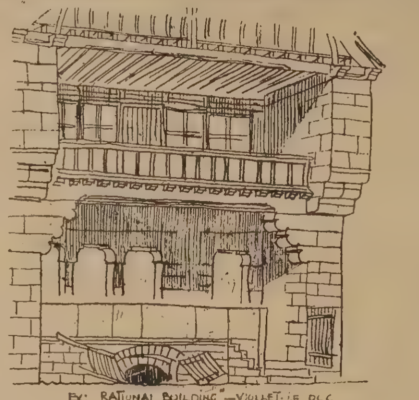
SHOP IN ARGYLL STREET - GLASGOW



A "SLATERS" RESTAURANT – LONDON

The treatment of the ubiquitous public-house, while in many respects not always according to the canons of good taste, has something to recommend it, at least, in the fact that it is as a rule easily recognisable by other means than by occupying with some companion establishments the corners of a street. In large towns, at least, the windows lend themselves to a special treatment. The lower portions, shoulder high, must obviously be treated with material which will stand more abuse than glass—it may be wood, tiles, or metal—while the upper portions for the purpose of affording light *must* be of glass, and, to prevent being overlooked by passengers on tramway cars, *must* be obscured in some manner.

Restaurants may, I think, have much in common with public houses, but some of the latest London places show indications of a special magnificence, prodigal in the use of granite, hammered metal, modelled plaster, and bevelled plate, calculated, I presume, to whet the hungry edge of appetite "by bare imagination of a feast." Slater's well-known places resort to more awe inspiring means by virtue of an American-like composition of curved glass and metal astragals, which certainly have the desired effect of attracting attention.



EX: RATIONAL BUILDING — VIOLLET-LE-DUC

For illustration more than emulation, I need hardly say, an example of this kind of work is here given, and this class of business, requiring as it does less of the plate glass, so far as mere exhibition of wares is concerned, is perhaps more easily treated than the others; and I can refer to no better example than Miss Cranston's new premises in Buchanan Street.

The cases I have quoted, however, are probably sufficient to bear out what I said regarding the possibility of artistic treatment arising out of the exigencies of the particular purpose to which the shop is to be devoted, and in addition to the points of detail referred to may assist in enabling us to make the most of our shop fronts as we are at present compelled to provide them.

Suppose now, in the second place, that clients are more elastic, and willing to forego more in the way of inordinate demands for every available square inch of room, the problem seems to come somewhat nearer solution, assisted, in some measure, by the fact that past experience, or precedent of older examples can then be given effect to. Before examining these, and merely asking from the client permission to build butts at intervals, and a possible further concession at the corner of the building, a great deal may be done in itself towards assisting not only the commercial value but the architectural expression. For instance, supposing there is a butt of reasonable width between each window—in the case of a long front—the architectural gain is not only patent, but the appearance of the window is enhanced by being thus set in a frame.

Where these divisions are merely astragals of brass, mahogany, or iron, the one window seems to get melted into the other, bewildering the onlooker, while detracting from each separate display. In the other case each window stands by itself, and so being one can better and more contentedly examine the wares, when we have no conflicting element adjoining, much the same as we seem to appreciate a picture better after the exhibition, when it is detached from its surrounding neighbours, excellent though they may be.

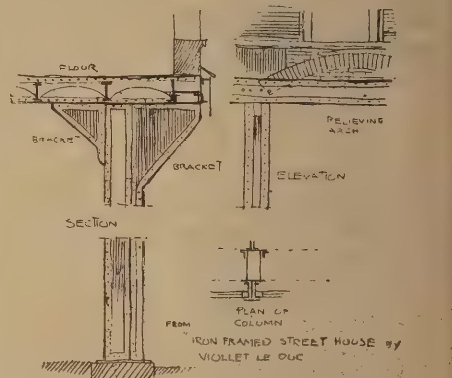
BRICK HOUSE MONTEPULEIANA

For an example I may quote the case of McGeoch and Kemp's premises, in George's Place, where although the dividing butts are circular columns and much larger than would be necessary, the effect of each window dressing is in itself entirely satisfactory.

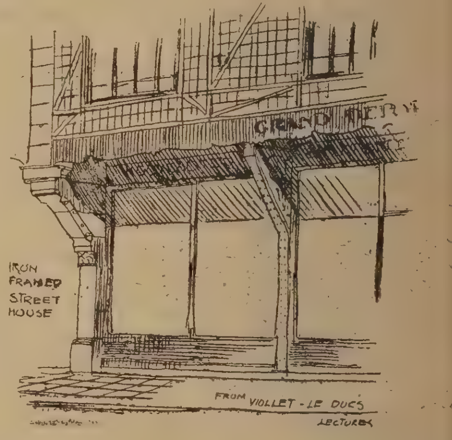
When on the subject of doors and following upon the pier question, there is no reason why these should be framed into the windows as it were, instead of forming a separate and better marked position at the side.

In the same connection, and consequent upon the convenience of a circular corner, the temptation to indulge in an arch over the doorway therein cannot be passed without a reflection upon the unsatisfactory effect of such a combination.

It is interesting to note Viollet-le-Duc's suggestions towards a rational solution which he indicates in his lectures. Whether his idea was obtained from some old Italian street fronts or examples in our own country does not matter; all that it contains in common is the salient feature of a projecting upper storey, which he proposed to use at once as a shelter from the weather and a sun shade. Here the supporting element consists of rivetted iron columns, finished flush with the windows, to which iron brackets for the support of the floor and projection over are attached, allowing of appropriate external and internal treatment. The juxtaposition of the window proper and the column is, to my mind, not happy, and in case of failure or repair by way of painting, &c., would be inconvenient and awkward. At the same time a considerable free surface is obtained, and the supporting features are not unduly concealed from view, and do not occupy much space laterally.



FROM IRON FRAMED STREET HOUSE BY VIOLLET LE DUC



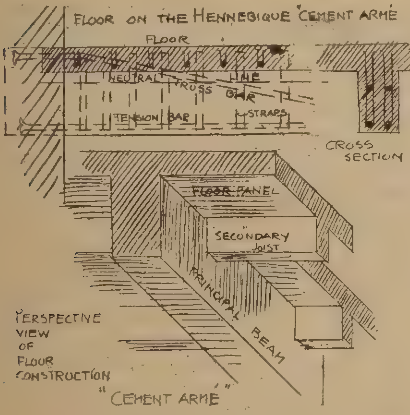
IRON FRAMED STREET HOUSE
FROM VIOLLET-LE-DUC'S LECTURES

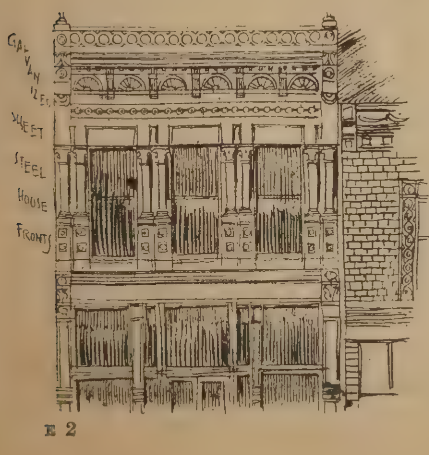
In his "Rational Building," however, he illustrates a mode of construction of house fronts common in Burgundy, consisting of a corbel arrangement supporting a bressummer-like gallery or balcony, recessed within which is the outer wall of the house or shop proper. This might well have been the prototype of the late E. W. Godwin's front to the Fine Art Society, in which the recessed portico forms a salient feature, the constructional functions being admirably expressed by the piers and columns on each side, while the commercial convenience is no less apparent. The same idea has been repeated in some contemporary works, and, it seems to me, offers a possible solution of the problem. The constructive element stands by itself, and the recessing of the shop front proper allows for any danger of subsidence, without endangering its entirety, while enabling it to be cut up and otherwise treated, or even left as one unobstructed space. The recess will hardly be lost space to the proprietor, inasmuch as it provides for the comfort of his patrons, who can thus examine his wares without fear of jostling by the crowd, at the same time being sheltered from the elements.

In the case of a long front it only means an extension of the principle to form a colonnade, which, as we have seen, is an old contrivance, for it is in the main similar to the Chester Rows, which arrangement to this day is in every way convenient for shopping, new buildings on like lines having been erected within recent years.

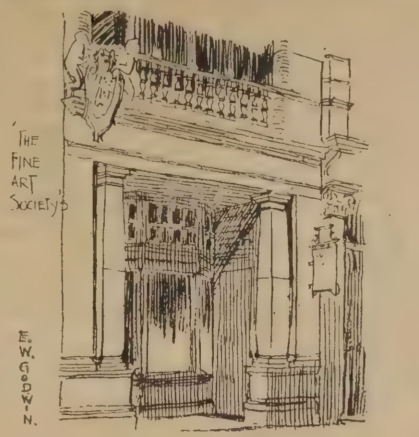
Even to us the idea is not a stranger, because at Greenock, Messrs. Barclay have carried out at the Municipal Buildings there a similar arrangement, appreciated by the public, and, so far as I have ascertained by the shopkeeper; the colonnade itself may either be trabeated or arcuated, the former, for reasons already given, for preference. The lintel difficulty (that is to say, difficult if honest construction is to be observed) may be solved either by a flat arch, exposed iron beams as before, or *concrete*. With regard to the latter, the French "Cement Armè" system seems quite logical, consisting as it does of iron and cement in their proper statical capacities with regard to their resistance to stresses, while, if we must, it certainly conforms to the aforementioned building regulations.

Objection has been taken to the colonnade because it "gave rise to scenes inconsistent with the highest theory of social life;" but collapsible gates and more light would put the veto on this objection. The mention of light recalls a suggestion, and, I think, a good one, which I saw recently, that shopkeepers should keep their premises illuminated until after dark, thus enabling their wares to be inspected by those who cannot do so before closing time, while at the same time adding to the lighting of the thoroughfare and adding to their own prominence, not to mention financial interests, for, as a safeguard against shop breaking, light is invaluable, and more so when assisted by the offices of an intervening colonnade.





GALVANIZED SHEET STEEL HOUSE FRONTS



Of course, iron must always enter more or less into the construction of our shop fronts, but it would not be necessary in this case to adopt it so largely as at present, as it would also enable us to avoid introducing the steel-framed structures which we find in America. These I have avoided referring to, in so far as shops are affected, because a solution of the problem has not yet been accomplished, even there, by this mode of construction, which conceals entirely the supporting elements. There also exists there, however, a system of construction, which exposes in all conscience these elements, inasmuch as it consists entirely of steel; but it does not on that account by any means produce a more satisfactory result, and I crave your indulgence while I quote from an advertisement in an American paper, which accompanied the illustration here reproduced. It represents a galvanised sheet steel shop and house front—net price at New York, £41—then to quote, "this price includes 20ft. cast iron sill, course 8in. wide, combination wood and steel columns, all the galvanised iron work of second storey, bottom of lintel course to top of main cornice and pediment, all shop windows, doors, transoms, and transom bars, window frames, all glass double strength" (for support, I presume). "We make and ship 800 fronts annually, 10ft. to 300ft. wide, one to five stories high. They are now the best, cheapest, and most elaborate in the market. Any ordinary mechanic can put up our fronts, owing to their simple construction, and aided by a set of instructions sent with every shipment. We desire to introduce this class of work into every city and town in the United States, and, therefore, solicit the correspondence of architects, builders, and parties contemplating building. Catalogues on application."

I have not alluded to shop fronts which embrace two floors or storeys. In cases where the upper floor is not necessarily required to be as entirely free from obstruction, and where an arch can be introduced which takes the superincumbent weight, many of the difficulties of support do not present themselves, other than the accurate proportioning of the abutments, to which, in lieu of the increased window space over, the client should not seriously object. I have merely attempted to embrace, so far as they presented themselves to me, the difficulties involved in a one-storey shop front—the class of thing which most frequently comes under the architect's notice; and, in leaving the subject here for your further consideration, I feel sure that many points of difficulty, and many aspects in which the subject has presented itself to others, must have been omitted, which omissions have been inadvertent on my part, and only serve to prove the existence of many intricacies in one of the most absorbing problems of our modern architecture.

Members of the Belfast Mechanical Engineering Association recently visited Loop Bridge Works, which belong to Messrs. M'Caw, Stevenson, and Orr, Limited.

Correspondence.

"DELPH" STONE.

To the Editor of The Builders' Journal.

Liverpool.

Dear Sir,—The "Delph" stone T. H. S. asks about (see p. 8 of last week's issue) is apparently nothing more than *quarried* stone, a quarry in the dialect of the West Riding of Yorkshire being known as a *delph*.—Yours truly, R. W. G.

SOUND-PROOFING ARRANGEMENT.

To the Editor of The Builders' Journal.

London, N.W.

Sir, — With reference to the enquiry addressed to you by "North London," and published in last week's issue, I should certainly advise your correspondent to obtain samples of Patent Combined Silicate Cotton and Plaster Slabs from Jones and Co., Perrin Street, Kentish Town, and if he finds that particular form of silicate cotton not suitable for his present requirement, doubtless they could supply the material in a form which would meet his requirement.

Unless concrete be used at a much greater thickness than mentioned by your correspondent, I cannot see how such a solid body could act as a non-conductor of sound, as it is quite contrary to the laws of sound. Silicate cotton is undoubtedly the finest hair-harbouring body in existence, and it has the extra advantages of being absolutely incombustible and sanitary, and of being applied in a dry state.—Yours truly, C. CHRISTIE.

A SUGGESTION.

To the Editor of The Builders' Journal.

Dear Sir,—May I venture to make a suggestion with regard to the Builders' Journal, which I hope will meet with your approval. This is, at the end of every five years to publish a complete table of contents or index up to date. I have taken in your paper since the commencement, which, if I am not mistaken, was five years ago next February, and have found it most useful for reference, but have felt very much the want of a combined index. Hoping that by the end of the next half year you will see your way to do this, always continuing the index to each volume.—Yours truly, V. H.

[Such an index as V. H. suggests would involve considerable labour and expense, which would not be justified unless there were a fairly large demand for a publication of the kind. If we had reason to suppose that it would meet a widely felt want, we should be pleased to undertake its preparation. We should, therefore, be glad if any readers to whom an index to the first ten volumes would be likely to prove valuable would communicate with us.—Ed. B.J.]

Fire at a Joiners' Workshop.—A disastrous fire occurred at the workshop of Messrs. Chinie and Son, joiners, of South Shields, last Thursday. All the workmen escaped with the exception of one apprentice, named Elliot, aged sixteen years, whose body was subsequently discovered burned to a cinder. Another apprentice was badly injured.

"The Property Gazetteer" is a new monthly publication, intended to afford a medium by which the public may be made aware of the estates, houses, and properties of all kinds for sale or to let throughout the United Kingdom. The first issue contains 203 pages, each occupied by one city, town, or district. A descriptive heading of each place includes distance from London, trains and fares, and climatic, sanitary, scholastic and historical information. The remainder of the page deals with the local property market, giving a good selection of properties for disposal, houses—furnished and unfurnished—to let, &c. The plan on which the information is set forth is both novel and convenient. A monthly circulation of 10,000 copies is guaranteed. The price is one shilling, and the book is published at 144, Fleet Street, E.C.

Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor.

BOOK ON QUANTITY SURVEYING.

To the Editor of The Builders' Journal.

Skipton.

Dear Sir,—Will you kindly inform me, through your valuable journal, what book on quantity surveying you would recommend for a beginner?—Yours, &c., H. E. M. H.

"Quantities," by Prof. Banister Fletcher (price 6s.), B. T. Batsford, 94, High Holborn, W.C., is the book that will best suit your purpose.

FIXING STOVE TILES.

To the Editor of The Builders' Journal.

Scarborough.

Sir,—Would any reader kindly tell me what material to use for fixing tiles to slabs of stone or cement, such slabs to be fixed at the sides of interior stoves. I find when fixed either with cement or plaster the heat of the fire generally forces them off.—Yours, &c.,

T. R.

When stove tiles are not set in a frame they are usually set in cement or plaster, but Roman cement is credited with standing heat better than Portland cement, and might be tried.—Henry Adams.

PROJECTION OF SHADOWS.

To the Editor of The Builders' Journal.

Wandsworth, S.W.

Sir,—I should be obliged if you could inform me if there is any publication in existence treating of the projection of shadows in geometrical elevation and in perspective.—Yours faithfully, LIGHT AND SHADE.

The books that will probably best suit your purpose are the following:—"Sciography, or Parallel and Radial Projection of Shadows," by R. Pratt, price 7s. 6d.; and "Text-Book on Shades and Shadows, and Perspective," by John E. Hill, price 8s. 6d. net. Both these books can be obtained from Mr. B. T. Batsford, 94, High Holborn, London.

SURVEYING PRACTICE IN FRANCE.

To the Editor of The Builders' Journal.

London, N.

Sir,—Will you be kind enough to tell me where I could get any information as to the methods adopted by quantity surveyors in France, or in what way they differ from the general practice in this country? Also if there is any institution in France corresponding to the Surveyors' Institution here?—Yours faithfully, C. D.

There is no institution in France corresponding to that of the Surveyors' in London. The surveyors in France are called "vérificateurs"; they are more or less architects who manage houses and estates, value goods, and check all kinds of executed work following contracts. Each Government department has its own "vérificateur," and the Law Courts select such as they may require as experts from among the architects who discharge that duty. E. C.

"CYPHUS" TREES.

To the Editor of The Builders' Journal.

Haslingden.

Dear Sir,—I have an enquiry respecting cutting down trees in Lancashire about 150 years ago. In an old account it states: To falling (a given quantity) of English oak trees, then comes a given quantity of Cyphus, and the next a given quantity of Owlers and other trees the names of which I know, but what I want to know is what are the "Cyphus" to be cut down. There is a place about two and a half miles from here called Owler Bottom, and an old account shows that 700 Owler trees were cut down at one time there. QUERIST.

We are of opinion that the trees referred to are Cypress trees, though we cannot find the spelling "Cyphus" in any work on etymology. The forms "Cypur" and "Cypyr" occur frequently in old documents, and the Latin word being "Cupressus," it seems quite logical that an arboriculturist with a knowledge of the scientific names of plants, &c., would designedly, or by accident, spell it "Cyphus."—G. A. T. M.

BOOKS FOR SOCIETY OF ARCHITECTS EXAM.

To the Editor of The Builders' Journal.

Appleby.

Dear Sir,—As a reader of your valuable paper, can you give me a list of books that would be sufficient for the exam. of the Society of Architects, those that may be looked on as really necessary, leaving those merely required for occasional reference out of account.

I have the list of recommended books, but it is difficult to choose without advice.

CRAIG DOUGLAS.

The books necessary for the Society of Architects' exam. are:—History, Russell Sturgess "European Architecture" (or other approved work), supplemented by Fletcher's "Comparative History"; Construction and Materials, Rivington's or Mitchell's "Building Construction"; Sanitation, Coleman's "Sanitary House Drainage"; Stresses, Middleton's "Stresses and Thrusts"; Quantities, either Fletcher's or Leaning's book. The series of "Model Answers" of which the first instalment appears in our columns this week will, no doubt, prove specially useful.

Keystones.

Darfields Sewage Scheme.—The Local Government Board have requested that 600 yards of metal piping be laid instead of earthenware, and that the tanks be built much stronger than was specified in connection with the new sewage scheme for Darfield. The first estimate of the cost was £7,000, but the alterations made by the Local Government Board will add £2,000 to this.

The Sanitary Inspectors' Examination Board.—The first examination for certificates of qualification for appointment as sanitary inspector, under Section 108 (2) (d) of the Public Health (London) Act, 1891, will be held in London on Tuesday, December 5th, 1899, and the four following days. Particulars will be forwarded on application to the hon. secretary, Mr. W. R. E. Coles, 1, Adelaide Buildings, London Bridge, London, E.C.

Improvements at Yardley.—Mr. Sandford Fawcett, Local Government Board inspector, attended Sparkhill Institute recently, for the purpose of inquiring into the application made by the Yardley District Council for sanction to borrow the sums of £7,980, £2,365, £495, and £180, for the provision of public offices, depôt, fire station, and mortuary respectively, to be situated between Stratford Road and Little Showell Green Lane. Mr. F. L. Thompson gave evidence on behalf of the Council, and the consideration of the application was postponed, to enable the architect to submit detailed estimates.

The Ossett Sewerage Scheme.—An inquiry was held at the Temperance Hall, Ossett, last week, by Colonel A. G. Durnford, R.E., an inspector of the Local Government Board, regarding the proposal of the Ossett Corporation to borrow £5,000 for sewerage purposes. The scheme was explained by the Corporation's engineer, Mr. Sam Shaw, and is designed to deal with the sewage of certain outlying and recently developed portions of the borough, which were not fully provided for by the general drainage system carried out under the provisions of a special Act of Parliament obtained in the year 1875. The scheme was not opposed.

The Monument to M. Félix Faure is to be executed by the sculptor René de Saint Marceaux. The site of the sepulchre is on the right of the central walk rising to the chapel in the cemetery of Père-Lachaise, Paris. The site is six mètres in superficial area, and is at the side of the tomb of Thomas Couture, and in front of that of Paul Baudry. The monument is to be raised near that to the dead of St. Bartholomew, which will be surrounded by a Greek garden, in this same central walk.

The Widening of Ouseburn Road, Newcastle, was considered at a meeting of the Town Improvement Committee of the Newcastle Corporation last Wednesday, and arrangements were come to with the landlord of what is known as the lower part of Stratford Grove Terrace, for the widening of part of the Ouseburn Road, which is not far from Jesmond Vale, by a give and take line, which will materially widen the road at a given narrow point.

The New Wing of Tiverton Infirmary was opened last Thursday by Sir Stafford Northcote. The new building is called the Victoria Wards, and comprises two wards of two beds each for male and female patients, and in addition a waiting lobby, nurses' room, operating room, bath-room, boiler and heating apparatus for the entire building, with linen, coal, and wood stores, &c. The new wing is uniform with the rest of the building. Messrs. Deering and Son were the contractors, and Mr. J. Siddalls was the hon. architect. The cost was about £1,550.

The New Bishopthorpe Church was recently consecrated by the Archbishop of York. There are a south chapel for weekday services, north and south aisles, sacristy, and organ chamber; on either side the east window are the figures of St. Peter and St. Andrew—patron saints of the Minster and the church. Most of the fittings are of oak, but the side chapel is seated with chairs. The old fifteenth century font and two bells formerly in the now destroyed church of St. Crux, York, have been presented to the new church, which has cost about £5,000. Mr. Hodgson Fowler is the architect.

The New Kesteven Asylum.—A Local Government Board inquiry was held last Tuesday week into an application made by the Kesteven County Council for power to borrow £140,000 towards the cost of the erection of the new county asylum at Rauceby, near Sleaford. It was stated in evidence that it was originally proposed to borrow £120,000, but it had since been found that this would not be sufficient. The tender for the superstructure of the asylum was £106,393, and in addition it was estimated that £7,800 would be required for boilers, etc., £5,000 for electric lighting, £2,000 for farm buildings, £10,000 for furniture and equipment, £2,500 for laying out grounds, £8,000 for architects' and other fees—total of £144,693. Allowing for money already received, £139,730 was the sum likely to be required, and the County Council now asked for power to borrow £140,000. The asylum would accommodate 420 patients. They wished to obtain £50,000 forthwith in anticipation of securing a provisional order early next session.

Street Improvement and New Fire Station at Blackpool.—Last Wednesday Col. W. R. Slacke held a Local Government Board inquiry into the application by the Town Council for power to borrow £13,000 for street improvement purposes and £6,000 for the erection of a new fire-engine station. Mr. T. Loftos (the town clerk) explained that the first loan was needed for what is known locally as the Cow Gap Lane improvement, over which there had been much contention, the land in several cases having to be bought by compulsory purchase. The Corporation proposed laying a road 50ft. wide, and for the work £10,884 was needed, and the remainder of the loan would go to the purchase of land. The fire brigade was to be accommodated in a new building near the police station instead of the old place, which was inadequate, and which was to be removed for proposed street improvements already sanctioned. There was no opposition, and the inspector, having taken evidence, visited the localities.

MODEL ANSWERS TO EXAMINATION QUESTIONS.

Answers to Questions set in the Examination held by the Society of Architects in April, 1899.

By G. A. T. MIDDLETON and R. W. CARDEN, Associates R.I.B.A.

Note.—*It should be understood that the sketches given in this series of papers are purposely only very roughly finished, as the amount of work candidates are expected to do is so utterly out of proportion to the amount of time allowed. At the same time sketches should show sufficient detail to emphasize all the principal points. The sketches are reproduced on a reduced scale; they should, of course, be drawn considerably larger.*

1.—ARCHITECTURAL HISTORY.

(Part I.)

1. *Give illustrated description of the Erechtheion, or of the Choragic Monument of Lysicrates.*

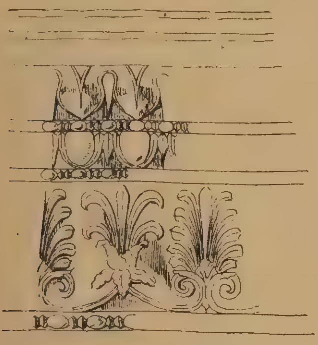
THE Erechtheion, of which the greater part was built in the year 420 B.C., or thereabouts, is of the Ionic order, and consists of:—

(*a*) A main portion, oblong in shape, with a hexastyle portico at one end and façade of half columns in tetrastyle in antis at the other.

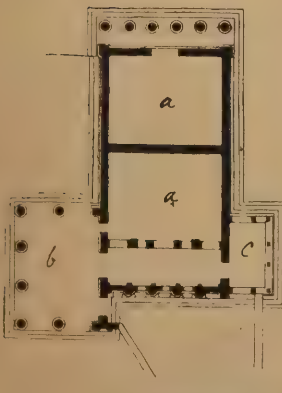
(*b*) To the north of this main portion a beautifully proportioned tetrastyle portico whose capitals, entablature, and enrichments generally, show the height to which Greek art and mechanical skill had attained four centuries before Christ. It should be noticed that the capitals have the unusual feature of a necking of anthemion ornament.

(*c*) To the south of the main portion another portico of the Ionic order, but with the entablature resting upon the heads of beautifully modelled caryatides.

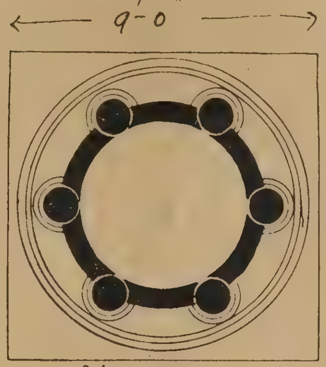
Taken as a whole, the Erechtheion is distinct from any type of building in Greece. Its three parts, as mentioned above, are treated as perfectly independent buildings placed in contact by accident, but there is a main guiding spirit above all their differences which keeps the group in perfect harmony.



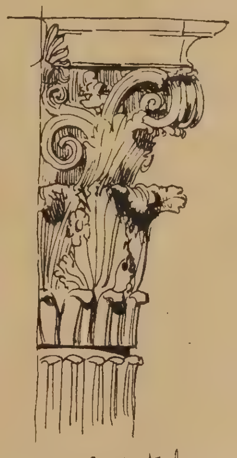
Enrichment from the Erechtheum



PLAN OF THE ERECHTHEION.



Plan Choragic Mon of Lysicrates



Half Capital Choragic Mon of Lysicrates

The enrichments are profuse and elaborate, yet perfectly refined and kept well within their proper limits.

The Choragic Monument of Lysicrates is one of the few instances in which the Greeks employed the Corinthian Order. It was erected in the year 335 B.C., and consists of a plain ashlar base, square on plan, 9ft. wide each side and 14ft. high. This is crowned by a simple moulding. From this platform rises a small circular structure with what appear to be six half columns. They are, however, actual columns as will be seen from the plan.

The spaces between the columns are filled with masonry, so that the columns appear, as above stated, to be only semi-circular pilasters. Upon these is carried the entablature as in purely columnar buildings. The roof is to a flat pitch, slightly curved in outline and surmounted by an elaborate finial of acanthus leaves, treated less conventionally than was usual among the Greeks. As is implied by its name, this was a monument and not a building properly so-called, and this would probably account for the almost "jeweller"-like refinement of its parts. Its total height was only about 35ft.

2. *Compare with sketches the following arches: Titus, Constantine and Septimus Severus; also give dates of each.*

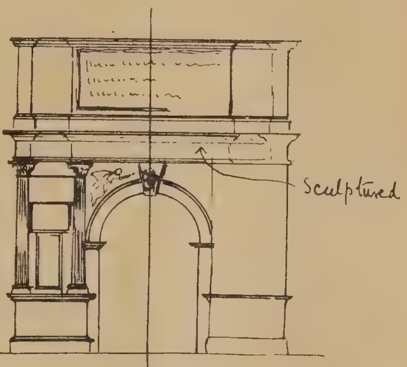
The arch of Titus was built by the Emperor of that name in 81 A.D. to commemorate the conquest of Jerusalem. It consists of one arch only, flanked by pairs of columns standing on a raised base, and with panelled wall spaces between each pair of columns. The order (composite) is crowned by an attic which is considered by modern writers as being slightly too heavy.

The arch of Constantine was erected about the year 330 A.D. It consists of three arches, a larger central one and smaller side arches. As in the arch of Titus, the columns rest upon raised bases or plinths, the mouldings of which are for the most part recessed and returned round the openings. The arches are well separated and delimited by four columns to either face, which carry, or profess to carry, the entablature. The whole is crowned by an attic divided into the three corresponding compartments by pilasters above the columns, the centre compartment containing the inscription, the side compartments each two carved panels, and the pilasters masked by small figures.

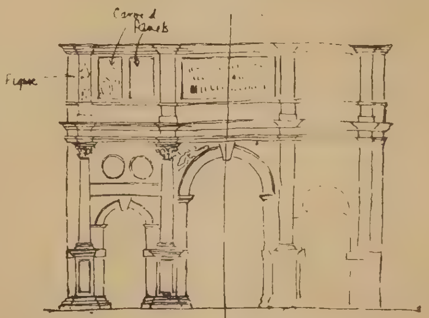
The Arch of Septimus Severus was erected in A.D. 194. In general form and proportion it is much like the Arch of Constantine. Like the above, it has three arches "framed" between columns. In this example the attic is not divided into compartments, but the whole available space is occupied by the inscription. The spandrils of the arches, and in the lesser openings, the panels between the spandrils and the entablature are filled with carving.

3. *Describe briefly the Cathedral and Baptistery of Pisa, giving dates and sketches to illustrate your reply.*

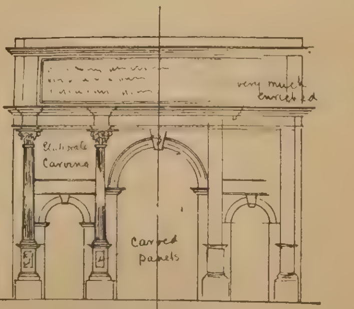
The Cathedral of Pisa was commenced in the year 1063, and is naturally in that style which is so difficult to name, but perhaps is most correctly called Lombardo-Romanesque. Its architect is supposed to have been a man



Arch of Titus



Arch of Constantine



Arch of Septimus Severus

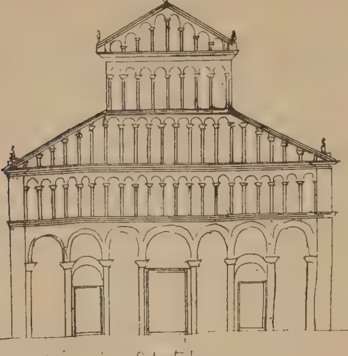


Diagram Sketch
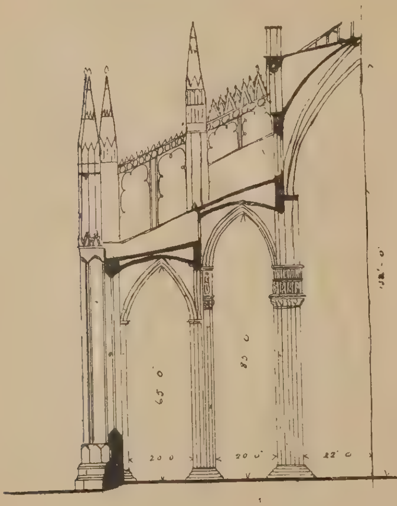
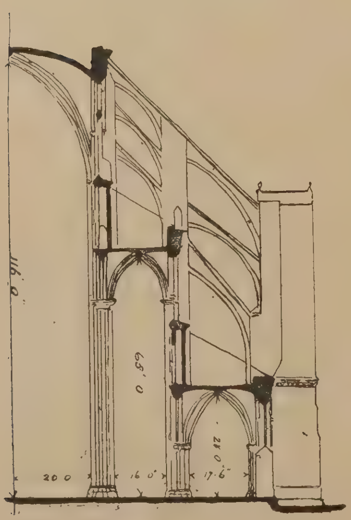
Pisa Cathedral

named Buschetto, but this is not proven. In plan it is cruciform with small apses at the east and transept ends. The crossing is spanned by a pointed dome, of which the lantern recalls those of St. Mark's, Venice. There is a suggestion of the basilica form in the nave and in the proportions of the nave arcading with its columns and round arches. Not more than half the columns, capitals, &c., of this building were sculptured purposely for the cathedral; the remainder were the spoils of the Pisani, obtained from Palermo, Majorca, &c.

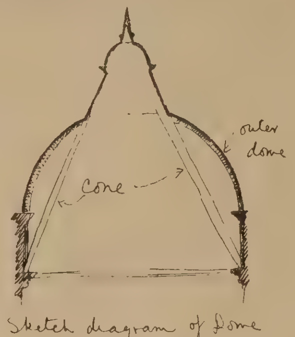
The façade of Pisa Cathedral may be described as the highest point of extravagance to which this particular style attained. The only internal feature marked externally is the line of nave and transept roofs. Beyond this, all is given up to arcading. The lowest stage consists of a wall of arcading of seven arches, three of which are pierced as doorways, the centre one flanked by antique Greek columns. Above this rise four tiers of the usual Lombardo-Romanesque arcades, built for the most part also of the spoils of other cities. Of these arcades, the lowest reaches from above the ground arcade to the eaves of the aisle roofs; the second occupies the height of the aisle roof, the end arcades accommodating themselves to the slope; the third occupies the space between the top of the aisle roofs and the bottom of the nave roof; and the fourth fills the gable end, the arches being shortened as in the second tier. The treatment of the ground stage and first and third tiers of arches is repeated round the sides of the Duomo, the second and fourth tiers being, of course, roof.



MILAN.



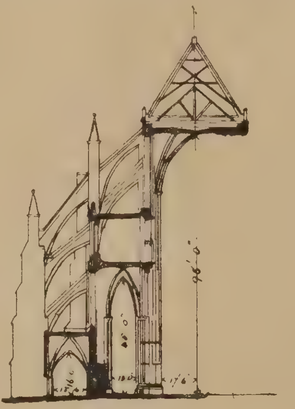
Bourges



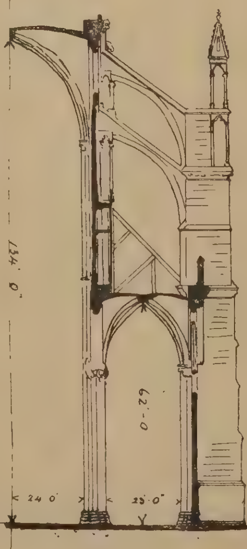
Sketch diagram of Dome over the Baptistery at Pisa

The figures at the angles of the roof are worthy of mention as being probably the first use of figure sculpture in a region in which hitherto the introduction of living figures had not been allowed.

The baptistery at Pisa was commenced about a century later, namely in 1152, the architect's name being Diotisalvi, or Dio-te-salvi. It is a circle on plan, differing in this respect from the usual form of these buildings, which was in nearly every other instance octagonal.



Westminster.



Amiens

Externally it consists of a wall arcade of twenty columns on the ground stage, most of the columns being spoil from other cities as in the Duomo. The principal doorway has antique Greek columns, also similar to the Duomo. The three other doors have spiral columns of Greek marble. Above this arcade is a second of fifty-eight arches coupled (evidently at a later date), and each pair surmounted by a Gothic crocketted pediment, foiled and cusped elaborately. Each pediment is divided from the next by crocketted and canopied pinnacles. The third stage consists of eighteen pilasters and twenty windows crowned with somewhat similar but less elaborate Gothic pediments and pinnacles.

Internally the ground arcade consists of twelve antique Corinthian columns and four pilasters, supporting a similar but far lighter arcade above. The diameter is 129ft., and the span of the dome is 60ft. This dome owes its peculiar shape to the expedient which was resorted to to render it stable; namely, an internal cone, of which the apex protrudes through the summit of the external hemispherical dome.

4. *Give comparative sections of Westminster Abbey, Milan, Bourges, and Amiens Cathedrals, to show the arrangement of aisles, roofs, buttresses, clerestory, and triforium.*

(*To be continued.*)

New Companies.

The Auchencarroch Quarry Co., Ltd.

This company was registered with a capital of £3,000 in £10 shares, to acquire and develop quarries and brickworks or brickfields.

Exeter Brick and Tile Company, Ltd.

This company was registered on July 31, by Taylor and Co., 12, Norfolk Street, W.C., with a capital of £10,000 in £5 shares, to carry on the business of brick and tile makers, builders' merchants, &c. The directors are to number not less than three, nor more than seven. Qualification, 50 shares. Remuneration as the company may decide.

Electrical Transmission Co., Limited.

This company was registered on August 1st, by Sanderson and Co., 46, Queen Victoria Street, E.C., with a capital of £30,000 in £5 shares, to acquire the business carried on at Hammersmith as the Electrical Power Transmission Company, to adopt an agreement with Messrs. Powell, Jones, and Co., and to carry on the business of electricians and mechanical engineers, &c. Messrs. Powell, Jones, and Co. are to be the first managing agents. Remuneration as fixed by the company.

Sturbridge Brick Company, Limited.

This company was registered on August 1st by Waterlow Brothers and Layton, Limited, Birchin Lane, E.C., with a capital of £20,000 in £1 shares, to adopt an agreement with Mr. C. Hobson for the acquisition of a freehold brickfield near Newmarket Road, Cambridge, and to carry on the business of brick and tile merchants, &c. The first directors (to number not less than three nor more than seven) are to be appointed by the subscribers. Qualification, £100. Remuneration as fixed by the company.

Waverley Court Estates, Limited.

This company was registered on August 1st by Jordan and Sons, Limited, 120, Chancery Lane, W.C., with a capital of £10,000 in £1 shares, to acquire the Waverley Court Estate, at Camberley, Surrey, to adopt an agreement with Mr. A. W. Hughes, and to carry on the business of builders, contractors, &c. The first directors (to number eight) are Messrs. T. J. Hankinson, F. H. Hankinson, W. Overbury, G. J. Lawson, W. T. Reynolds, E. Bath, T. J. Penton, and C. Steward. Remuneration as fixed by the company. Registered office: Richmond Chambers, Bournemouth.

Bricks and Mortar.

"It is not given to everyone to be a genius, but all can be good workmen. The fine artist, doubtless, is he who, as Midas turned everything he touched into gold, cannot make a study or design without giving it some character of beauty; but it is, alas! given to but few of us instinctively to beautify everything we touch. But the qualities of good workmanship are such as can be attained by anyone who has the true spirit of love for his art; and nothing will ever make me believe . . . that it is necessary to work down to the level of the taste of the age."—SIR E. J. POYNTER.

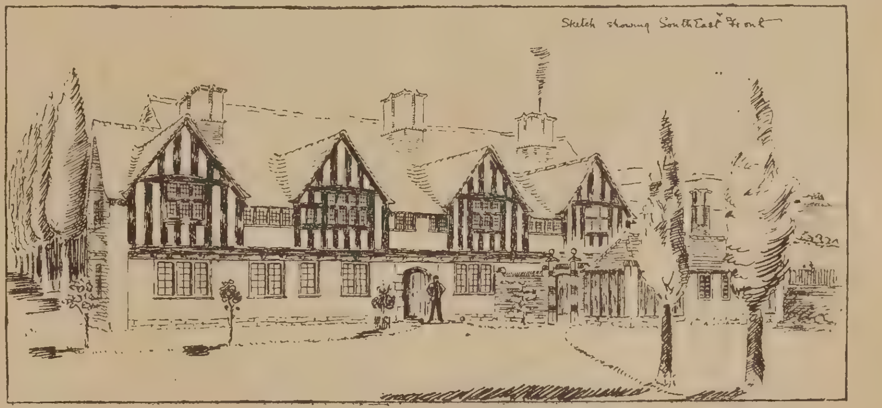
The Queen's Gift to the Nation. WE commented recently on the curious and instructive correspondence that passed between the Treasury officials and the trustees of the National Portrait Gallery with regard to the proposed purchase of three pictures, one of which was a portrait of the Queen by Sir David Wilkie. The sequel is not less curious. As the Treasury would not sanction the expenditure of anything beyond the absurdly small sum annually granted to the trustees of the Portrait Gallery, the pictures in question had to be left for more wealthy or more spirited collectors. Nevertheless, the gallery is no longer to remain without a suitable portrait of the Queen. Her Majesty herself has come to the rescue, and presented to the Gallery the portrait of herself in her coronation robes, painted by Sir George Hayter. This portrait is now at Kensington Palace, but it will shortly be handed over to the trustees.

Discoveries at Tunis. THE report of the Commission of Antiquities and Fine Arts concerning the discoveries made in Tunis during the past few months has just been published, and is very interesting. The most important find was made at Carthage, where three colossal Græco-Roman statues were unearthed. One represents Isis veiled and wearing a diadem ornamented with the upturned crescent; the others, which are somewhat smaller, are of two women, apparently priestesses, with head-dresses as worn during the first century. A very fine statue of Bacchus, giving drink to his panther, was found in another part of Carthage. At El Alia research has led to the discovery in a Roman villa of a large pavilion with two square turrets, joined by a gallery opening to the sea in front by a series of small rooms, which are paved with mosaics. The more important of these mosaics, those of the turrets, represent a Nile landscape, and a local landscape showing fishermen drawing a net full of fish from the sea. Excavations at Dougga have resulted in the finding of an admirable though colossal head of Lucius Verus in white marble. A Christian basilica, built on the ruins of a temple of Saturn, has been found at Thala, and at Teboursouk a triumphal arch let in a Byzantine citadel, of which nothing hitherto has been known, has been brought to light. In addition to these, numerous discoveries of sculptures in bronze and marble, among them a superb sarcophagus with bas-reliefs showing the three Muses, have been made.

Somerset Archæological Society. NEARLY forty members of the Axbridge branch of this society had an excursion to Bridgewater, on July 29th. Bawdrip Church was first visited. This church is a small cruciform structure with a central tower. Puritan church was next visited. It is dedicated to St. Michael, and is a Gothic edifice, 80ft. long and 26ft. wide, with a low spire. It has a thirteenth century screen, and a peculiar staircase in the porch, presumably leading to a former priest's chamber. A drive through Dunball brought the party to the ancient borough of Bridgewater. Here, at the invitation of Mr. and Mrs. Jackson Barstow, tea was partaken of at the Railway Hotel. A visit was subsequently paid to the parish church of Bridgewater, where the many interesting features were pointed out by the vicar (Rev. H. Bircham) and Mr. A. B. Cottam. An inspection of the house where Admiral Blake was born brought to a close a very pleasant excursion.

The Diamond Jubilee Medal. THE medal struck by order of the Corporation of London in celebration of Her Majesty's Diamond Jubilee has now been circulated among the members of the Court of Common Council. On the obverse side is a fine bust of Her Majesty, with an inscription in Latin explaining the occasion of the issue. On the reverse is a figure of Britannia seated on a rock, with the British lion at her feet. On the left are attendant female figures representing Industry and Progress. On the right, close to Britannia, stands the City of London, holding in her right hand a cornucopia, and supporting with her left hand a shield bearing the civic arms. Behind are two figures symbolical of Commerce and the Colonies. The legend above the group runs as follows:—"'From my heart I thank my beloved people. May God bless them.' V.R.I. 1837-1897." The medal has been struck from designs by Messrs. Spink and Son, of Gracechurch Street, E.C.

Design for a Country House. WE publish this week another of the designs which have been "highly commended" by the assessor in our recent competition. The elevations and plans will be found in one of our centre plates. The design is by Mr. Henry Rose, of 3, Staple Inn, Holborn, and was submitted under the motto "Martello."



Sketch showing South East Front

"BUILDER'S JOURNAL" COMPETITION: HIGHLY COMMENDED DESIGN. BY HENRY ROSE.

The following descriptive note accompanied the drawings:—"The conditions as published in the BUILDERS' JOURNAL have been followed as far as possible, and special attention has been given to economy of space in the plans. The private bathroom has been so placed as to provide a flush for the whole drainage system. One of the bedrooms is on the ground floor. A loft for boxes would be provided, approached through a trapdoor over passage to H.M.C., &c., by means of a step-ladder hinged at the top. If attics are required, they could be approached by continuing the back staircase upward. The materials used would be brick and stone, roughly plastered and distempered white where indicated on elevations. Where half-timber construction is used, a hollow space would be provided between it and the inner wall. The roofs would be covered with plain tiles."

The Great Wall of China. THE great wall of China is threatened with demolition. It is stated that an American engineer is on his way to China on behalf of a syndicate of Chicago millionaires, who desire to obtain a share in the expected big contract to be given out by the Chinese Government for the demolition of the wall. The wall is a striking evidence of the immobility of Chinese civilisation, and probably its destruction may be intended to show that now China has made a start in Western civilisation she means to make up for her stationary condition during the past 2,000 years. Erected 200 years before Christ, for the purpose of keeping back the warlike Tartars, the Great Wall of China is older by three centuries and a half than the walls of Hadrian and Antonine in our own country. These latter were insignificant in comparison with the Chinese work, neither of them being nearly 100 miles in length, while the engineering feat of the Emperor Shih Hwangti extends from the shores of the Gulf of Pechili to the remote inland Chia-yu barrier gate, a distance of 1,200 miles. The British walls have almost disappeared, being only traceable here and there by green mounds or shapeless fragments of masonry, except at a few points which owe their preservation to the care of the archæologist. The hand of time, aided sometimes by the hands of the utilitarian builder, who has found some parts of the walls convenient quarries, has slowly but surely removed almost the whole of the work of the Roman engineers. Shih Hwangti did his work in a most substantial manner, for his wall remains to-day in almost perfect condition.

St. Mary-le-Bow Church in Danger. IT is now nearly a year ago since certain ominous cracks were observed in the solid masonry of the church of St. Mary-le-Bow. These openings were naturally ascribed to the burrowings of the Central London Railway under Cheapside. Sir Benjamin Baker has made careful examination. There are five cracks, two of which may be traced on the outer western wall and three in the porch; two of them look alarming. One seems to threaten the severance of the tower from the arches of the porch, while the other runs from floor to roof through a couple of feet of stone and solid brick. The theory is that the tower—221ft. high and in some places 8ft. thick—has given way on the north side, and has fallen 13in. from the perpendicular. Strangely enough, there are no indications of subsidence below the level of the street. After the Great Fire which destroyed the Norman church, Wren used the arches and the solid Roman causeway for the foundation of his building. Some of the vaults, in which are mummies and several hundred coffins, have been closed since 1819, and until they can be inspected the extent of the damage cannot be precisely estimated. Steps are to be taken to insure the safety of one of the most interesting historical buildings in the City.

Architectural Absurdities. UNDER this heading Lord Greenock makes a suggestion for the improvement of public buildings in a letter to the "Daily Graphic" of last Saturday's date. He says "I am glad to see in your issue of today that Lord Wemyss and 140 members of the Upper House are making an effort to stem the tide of architectural absurdities which threaten to flood the metropolis. Novelty appears to be the only object in view, and 'novelty cannot be content to add, but it must deface.' Redundant decoration founded upon ridiculous false construction, freely applied! As an example, I would refer your readers to a perspective design of the School of Art Needlework in which the upper storey of the building is surrounded by pilasters supported upon brackets. As but one step further in the same direction may I be permitted to suggest that in the next design foisted upon a long suffering public all pilasters and columns should be inverted, resting on their capitals with their bases up in the air. No critic would be found bold enough to say this lacked novelty, and was not thoroughly up to date."

A Reply. In reply to the letter from Lord Greenock, "F. B. W." infers from the reference to Lord Wemyss that Lord Greenock classes the new War Office as an architectural absurdity. The writer goes on to say that one gathers that it is absurd because "novelty appears to be the only object." On this he remarks: "Now, is not novelty exactly the last quality one would impute to this scheme. Would one not rather call it a little formal and severe, as in my humble opinion it should be? Does it not closely follow the style of Inigo Jones's work? By no stretch of imagination can it be called novel. To come to the other example, the School of Art Needlework now being 'foisted upon a long-suffering public.' The pilasters of the upper storey rest upon the solid wall, not upon brackets as stated. There are, however, some pilasters at the angle of the building whose bases overhang the wall a few inches, and these are corbelled, but how can Lord Greenock so far have forgotten his architectural learning as to suggest that this is a novel method? It may be in his opinion an architectural absurdity, but it is, as he must remember when he thinks again, absolutely common both in Gothic and Renaissance work. I should like to bring to his recollection one building which he will probably acknowledge to be beautiful, namely, the Palacio de Monterey, at Salamanca. Here the pilasters of the upper storey of the whole façade are carried on brackets." The building which is the subject of Lord Greenock's criticism is illustrated in one of our centre plates this week.

Leeds and Yorkshire Architectural Society. We have just received the annual report for 1899 of this Society. It notes an increase in membership from fifty-three Members and forty Associates to sixty Members and thirty-nine Associates. The number of honorary members remains at twenty-two, the same as last year. Nine ordinary meetings and seven council meetings have been held since the publication of the previous report. The following prizes are offered for competition to all Associates of the Society:—The Society's silver medal and an additional prize of five guineas, offered by the President for measured drawings of any ecclesiastical or domestic building, or part of a building, erected anterior to A.D. 1800; a sum of three guineas, offered by the Society for the best design for a higher grade school for 400 scholars; a sum of three guineas, offered by the Society for drawings showing the construction of a dome 50ft. in diameter; a sum of two guineas, offered by the Society for the best essay on "The Drainage, Sewerage Disposal, and Water Supply of a Country House;" a sum of five guineas, offered by the President, for the best set of sketches done between November 1st, 1898, and October 1st, 1899. All drawings and work for these competitions must be delivered by October 1st, 1899. Further particulars can be obtained from the Hon. Secretary, at the Thoresby Society's Rooms, Old Medical School, Park Street, Leeds.

Boiler Explosions. The Manchester Steam Users' Association send us a pamphlet containing the annual memorandum of the Chief Engineer, Mr. C. E. Stromeyer, M.I.C.E., dealing with matters of general and technical interest, such as the moral responsibility resting on owners of steam boilers, even after they have insured them, the best type of boiler for any particular service, some experiences as regards causes of boiler explosion, more particularly the influence in this respect of last year's dry weather, an exhaustive analysis of over 200 furnace collapses and experiments, including the German Admiralty experiments, which have not been previously published here.

The Association's Work. The Steam Users' Association was founded in 1854 for the purpose of preventing steam boiler explosions by competent scientific inspection of the boilers. After a boiler has been examined and found fit for its working pressure the Association gives a pecuniary guarantee of its safety to the extent of £1,000 or £2,000. In the event of explosion this guarantee covers both loss of life and property, as well as claims under the Employers' Liability Act and the Workmen's Compensation Act. The Association does not guarantee boilers on the principle of averages, but as the result of competent scientific inspection; its object is Prevention not Compensation. The Association is not a Joint Stock Company; there are no shareholders to whom dividends are paid out of the members' subscriptions, but the income is appropriated solely to promote the direct objects of the Association. The Committee of Management is elected annually at a general meeting of the body of shareholders. The pamphlet will be found most useful to all users of boilers.

A Street Cleaning Elephant. It is stated that the streets of Chicago are at present being cleaned by an elephant. In itself the fact would be remarkable, but it becomes doubly so when the elephant in question is not a real one, but an animal made of steel, which is being tried with a view to seeing whether it is to be adopted as the regular street-cleaner of the city. The work is done by means of the trunk, which is constructed of hundreds of steel bands linked together, giving it a perfect suppleness, while in the head is a powerful automatic bellows, and in the inside of the animal is the machinery by which it is propelled and by which it is worked. If this fashion spreads, the streets of many of the great cities will resemble peripatetic zoological gardens or parts of a circus parade. Perhaps the next invention will be a window-cleaning giraffe.

Sir John Millais's Grave. In a letter to the "Times" of August 11th, Mr. Algernon Ashton calls attention to the fact that there is not yet any indication of Sir John Millais's resting place. He says: "On August 13th three years will have elapsed since Sir John Millais, the greatest English painter of modern times, passed away after a long and painful illness. He was buried with befitting pomp in St. Paul's Cathedral, near to the graves of Leighton, Turner, Reynolds, and other illustrious masters of the brush. But, surprising to relate, there is as yet not the slightest indication of the exact spot where the remains of Millais lie interred. I myself happen to know that the grave is situated in the immediate neighbourhood of the resting-place of Sir Christopher Wren, but the rank and file of visitors can only ascertain this by asking an attendant. If the slab which will ultimately cover the grave of Sir John Millais is not yet finished, then I venture to suggest that a temporary tombstone with a short inscription should be placed upon the spot, as is at present the case with William Ewart Gladstone's grave in Westminster Abbey." The suggestion Mr. Ashton makes is a good one, and if there is no probability of the permanent tombstone being erected for some time, it should be carried out.

Hammersmith Churchyard. At a recent sitting of the Consistory Court of London, before Dr. Tristram, a petition was presented by the vicar and churchwardens for a faculty to authorise the laying out of the north-west portion of Hammersmith Churchyard as a playground for the scholars attending the church schools, which have recently been rebuilt. Evidence was given in support of the petition. The old church schools, which were in a dilapidated condition, have been rebuilt, a sum of £4,600 having been obtained for the purpose of defraying the cost of rebuilding. It was desired that the north-west portion of the churchyard should be laid out as a playground for the scholars attending the schools, and it was proposed to separate the portion so laid out from the rest of the churchyard by a paling. The Chancellor of London, in giving judgment, said the application was a somewhat unusual one. It appeared from the evidence that it was quite impossible to obtain any playground for the boys and girls. When the church was rebuilt remains and also thirty-five tombstones were removed from the churchyard to the north-west corner of the churchyard. The Court was asked to sanction the removal of the tombstones to another part of the churchyard, which it was prepared to do, and also to sanction the north-west portion, which covered a space of a quarter of an acre, being appropriated as a playground for the children. The north-west portion would be separated from the rest of the churchyard, and the boys' part of the playground would be separated from the girls'. The Court would decree a faculty as prayed.

Monument to Charles Garnier. The Committee for the erection of the monument to Charles Garnier recently met to choose between several sketches which have been presented to them by M. Pascal, of the Institute. His design consists of a base in red granite enriched by green granite which supports the bust of Garnier, by Carpeaux, between two allegorical figures, one glorifying the master architect and the other studying his work. These figures and the bust of Garnier will be in bronze. The site of the memorial is the centre of the recess formed by the double slope of Rue Auber, Paris. The monument will be distant from the rotunda of the library between three and four mètres. On the front of the monument there will be no other legend than the name of Charles Garnier and the dates of his birth and death, with, at the foot, the plan of the Opera House, cut in the granite.

The Roads Improvement Association. This association has just been incorporated. Its objects are (1) To circulate amongst ratepayers, county councillors, members of boards of works, road surveyors, and others having control of or employed in connection with roads, authoritative information upon all matters concerning the construction, maintenance, and repair of roads; (2) to confer with councils and vestries, gas, water, and electric companies, and other public bodies on all matters affecting roads; (3) to promote improvements in the laws regulating roads; (4) to engage and pay for professional advice, remonstrate with authorities who allow roads to suffer from want of repair or neglect, and, if necessary, take legal action to enforce the rights of the public and ratepayers; (5) to oppose and resist any proceedings calculated to deprive the public of any rights over such roads; and to take up the question of finger-posts and milestones, without which no road can be considered perfect. Offices have been secured at Lonsdale Chambers, Chancery Lane, and Mr. E. Dudley Ward is the hon secretary and treasurer.

L'Academie des Beaux Arts. The Academy has elected M. Philippe Gille as a member in place of M. de Comte Delaborde. The Grands Prix de Rome for Painting have been awarded as follows:—First: M. Louis Roger, born August 26th, 1879, at Paris, the pupil of MM. Jean-Paul Laurens and Benjamin-Constant; Second Grand Prix: M. Victor Guétin, born March 17th, 1877, at Saint Denis (Seine), pupil of MM. Jules Lefebvre, Benjamin-Constant and T. Robert-Fleury; and M. Laurent Jacquot-Defrance, born April 22nd, 1874, at Perthus (Pyrénées-Orientales), pupil of M. Bonnat. The Grands Prix de Rome for Sculpture have been awarded as follows:—First: M. André-César Vermare, born November 27th, 1869, at Lyon

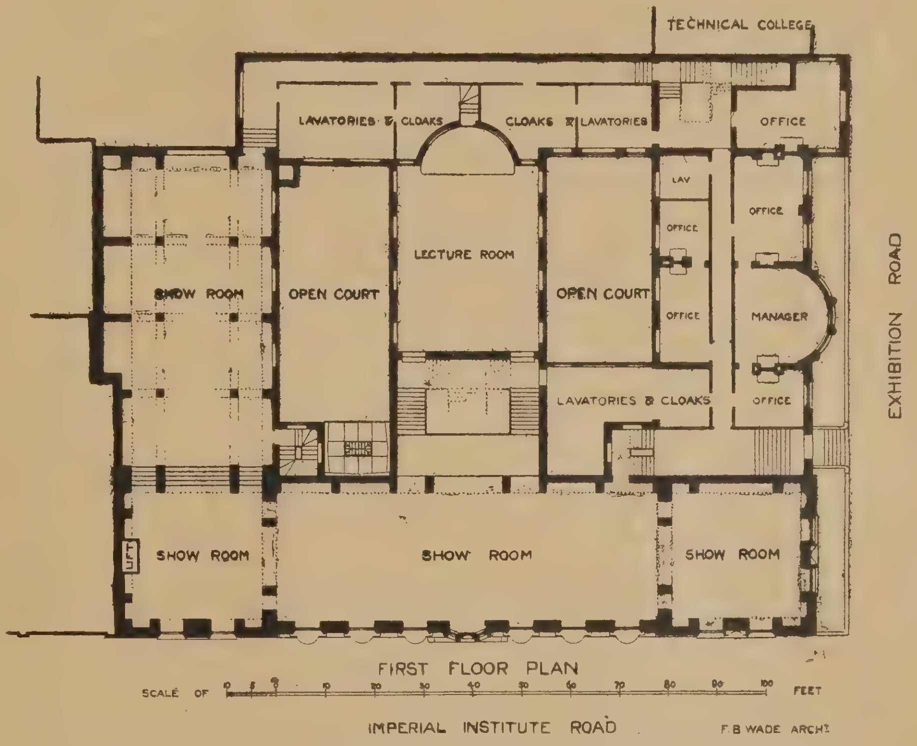
(Rhône), pupil of MM. Falguière, Marqueste and Lanson. Second: M. Alphonse Camille Terroir, born November 12th, 1875, at Marly (Nord), pupil of M. Barrias; and M. Louis-Henri Bouchard, born December 13th, 1875, at Dijon (Côte-d'Or), pupil of M. Barrias. The subject for this prize was the grief of Adam and Eve over the corpse of Abel. The Troyon prize, for which the subject was the harvesting of seaweed along the coast, has been awarded to M. Alphonse Cellier, born September 17th, 1875, at Gardanne (Bouches-du-Rhône); honourable mention has been accorded to M. Didier-Marie Calvès, of Paris, M. Jacques Simon, of Paris, and M. Abel Bertram, of Saint-Omer. The Bordin prize (value 3,000 francs), for which the subject was the influence of the study of archæology in general on architecture, has been divided among the following authors of essays:—1,500 francs to MM. André Berard and Alfred Berthier, of Paris; 1,000 francs to M. Henri Chabœuf, vice-president of the Académie de Dijon, of Dijon; 500 francs to M. Georges, architect, of Lyon. The Houllevigne prize (value 5,000 francs) has been awarded to M. Mayeux, architect, for his work entitled "Fantaisies Architecturales." The Bailly prize (value 1,500 francs) is taken by M. Fauré for his publications on architecture.

Caerwent Exploration Fund. In view of the success attained by the excavations carried out by the Society of Antiquaries at Silchester, the site of the Calleva Atrebatium of the Romans, it is proposed to excavate and explore in a similar way some of the portion of the Roman remains at Caerwent, in Monmouthshire, the site of the ancient Venta Silurum. As is well known the efforts of the Society of Antiquaries at Silchester have met with marked success. A very large portion of the ancient City has been examined, and the streets and houses have been accurately planned. Many very interesting remains of the domestic life of the inhabitants have been found, and the discovery of a Christian Church close to the Forum may almost be said to mark an epoch in this branch of historical research. That the work so ably begun at Silchester, should be carried on with equal energy and care in other parts of the country is, it need not be said, a matter of first-rate importance, and steps have already been taken to excavate and explore the Roman City at Wroxeter, in Shropshire. A strong Committee for the administration of the Fund has already been formed. Donations may be sent to the hon. treasurer, Alfred E. Hudd, F.S.A., 94, Pembroke Road, Clifton.

The City of Venta Silurum. The City of Venta Silurum above referred to is situate on the Roman road between Isca Silurum (Caerleon) and Chepstow, and was one of the stations on the XIV. iter in the Antonine Itinerary. Like Caerleon, it doubtless dates its origin from the time of the subjugation of the Silures by Ostorius and Frontinus in the years 50-75 A.D. The city itself is rectangular (about 500 yards by 400 yards in extent), and a large portion of the ancient city wall is still standing. Relics of the Roman city are constantly being found, including several fine pavements; but the only systematic exploration that has been carried out was done by Mr. Octavius Morgan in 1855, when a house and some baths were excavated in the south-east quarter. A fine set of baths was discovered here, and a pavement which, with other things, was removed to Caerleon. With this exception the Roman antiquities found in this interesting site have perished, and no record has been preserved until the year 1893, when Mr. Milverton Drake, in conducting some building operations, found another house, and planned as much of it as time would permit. The houses and cottages of the more modern village of Caerwent will prevent a large part of the site being explored, but there are still some fields unoccupied by houses, and it is proposed to systematically excavate these and carefully plan the streets and houses, as has been done at Silchester. If possible the cemeteries will also be explored.

Professional Practice.

Aldershot.—The competition for the design for a new Masonic Hall at Aldershot has now been decided. Sixteen designs were sent in. The assessor was Mr. Edwin O. Sachs, whose experience regarding places of public entertainment is so well known. Mr. Sachs accorded the first premium to the design entitled "Labour and Refreshment," recommending the author to be commissioned to erect the building with certain modifications, and the Board of Directors have approved of his report. Mr. Sachs further reported that no second premium could be awarded, as no one design showed sufficient superiority over the remainder to merit this distinction. Mr. Sachs, in his report, pointed to the great superiority of the successful design above the others sent in, and considered that both in practicability and compactness of plan, as well as in its architectural rendering, it was by far the best piece of work presented, and did great credit to the author. On opening the sealed envelopes, the authors of the design were found to be Messrs. Clarence T. Coggin, A.R.I.B.A., and Thos. Wallis, of 15, York Buildings, Adelphi, London, E.C.



ROYAL SCHOOL OF ART NEEDLEWORK, SOUTH KENSINGTON. F. B. WADE, F.R.I.B.A., ARCHITECT.

Bridlington.—The Bridlington Grammar School was opened last Wednesday by Lord Herries, in the presence of a large gathering of persons from several parts of the East Riding. The school is built in the Renaissance style, and is a two-storied building. It is situated on the Bessingby Road, and has a southerly aspect. The block includes the head master's house and rooms for the assistant masters; it stands in its own grounds of about thirty acres, and has a perfectly open situation within view of the sea. The ground floor contains the main hall and schoolrooms, and the dormitories are upstairs. There is accommodation for from thirty to thirty-five boarders, and from seventy to seventy-five day scholars. The main hall is worthy of special note owing to its open timber pitch pine roof, which is entirely plain, straight from the joiner's hands, and there is not a nail or screw visible. The flooring is of the herring bone pattern, in pitch pine. Ventilation and drainage, as is only to be expected, have been brought as near perfection as is possible. The dining-hall is a very fine, open building, and ample kitchen and lavatory accommodation is provided. Attached to the school is a chemical laboratory. The architect was Mr. Bilson, Hull; and the clerk of works, Mr. W. H. Williams, for Messrs. Thompson, of Peterborough; the total cost will be about £10,000.

Gateshead.—The foundation stone of the new Drill Hall for the 2nd Battery of the 1st Newcastle Artillery in Leddell Terrace was laid last Wednesday. The hall is 80ft. long by 47ft. 6in. wide, with the main entrance from Liddell Terrace in the centre. At one end of the hall are officers' quarters, with private entrance from the front street, orderly office, clothing store, armoury, and harness-room, with archway leading to the parade ground. Above these, on the first floor, are the caretakers' quarters, and gallery the full width of the hall. At the other end of the hall are the sergeants' mess, gunners' mess, lavatories, &c., and small yard. The building is of red brick with stone dressings. The contractor is Mr. E. T. George, of Newcastle, and the architects are Messrs. Watson and Curry, 18, Grainger Street, Newcastle, under whose supervision the building will be carried out.

Kensington.—We publish this week a plan and elevations of the Royal School of Art Needlework, the foundation stone of which was laid by the Prince of Wales on June 23rd. The new building is intended for the permanent housing of the school, which has for about twenty-five years occupied temporary premises in the Exhibition Road, next the Technical College. The school is also making arrangements to establish classes for teaching and practising other forms of applied arts. The building consists of large showrooms, workrooms, studios, a quantity of moderate-sized classrooms, and offices for management. The materials used externally are Portland stone and blue pennant for the walling of the principal storey, and Portland stone for the upper part. Mr. Fairfax B. Wade, F.R.I.B.A., of 148a, Sloane Street, S.W., is the architect, and Messrs. G. H. and A. Bywaters are the contractors. The elevations are given in one of our centre plates.

Llandaff.—The house illustrated in one of our centre plates has recently been erected for Wm. Taylor, Esq., M.D., J.P. It stands in a good position on the Llandaff Road, about one and a-half miles from Cardiff. It is built of best red bricks (Dennis, of Ruabon), the dressings being of Bath stone. The walls are built hollow, the walls of cellar cavity being filled up with White's rock composition, the windows are glazed with plate-glass, roof is covered with red tiles from Lewis, of Cannock, the soil drains are laid with Macfarlane's 4in. glass-glaved iron pipes, and careful attention has been paid to ventilation, both inlet and outlet. The hall runs up to the roof, and is lighted by a large window, filled with tinted ambetti glass, in scroll design, by Savell and Co., London. The hall and passage floors are laid with oak and teak blocks, and the porch with mosaic. The baths, closets, &c., are from the works of Doulton, of Lambeth, on the latest improvements. Hot water pipes are of copper. The work has been carried out by Messrs. E. Turner and Sons, of Cardiff, from the designs, and under the supervision of, Mr. C. B. Fowler, F.R.I.B.A., of Cardiff. The cost of house, boundary walls, gates, and laying out ground amounts to close on £4,000.

Perth.—A new hall is to be erected at Almondbank under the supervision of Messrs. M'Laren and Mackay, architects, of George Street, Perth. The building is of simple design, and consists of a public hall having accommodation for nearly 300 people, a committee-room, a ladies' room, and other conveniences. The front elevation is of terra-cotta bricks with stone facings, while the roof is of green Craigielea slates with red tile ridges. The building is properly ventilated, and well lighted from the front and sides. The main entrance will be from the front, while there are also entrances from the sides which communicate with the committee and ladies' rooms. A large and commodious platform will be erected at one end of the hall, while the interior will be suitably varnished and painted.

Plymouth.—Public services were held at the beginning of last week to mark the completion of structural alterations at George Street Baptist Church. The alterations consist of a new organ chamber, 52ft. long, between the church and the lecture hall, a new vestry and a blower chamber for the hydraulic engines without the main walls. The main east wall of the church has been cut through in three places for the transmission of sound and for the central organ case. The side apertures have been filled with carved and moulded teak tracery frames, enclosing artistic wrought metal work. The central opening is occupied with the organ front, the chief feature of the scheme. This front consists of an elaborately carved oak case springing from the rostrum floor and ascending to the ceiling with three separate tiers of pipes, each surmounted with a carved canopy. The pipes are decorated in a manner to harmonise with the general features of the oak case and its surroundings. The whole of the central work has been designed and executed entirely in Plymouth, Messrs. Hele and Co. having executed the organ and organ case, Messrs. Trevenen the carving, Messrs. Harris and Son the decorations, and Mr. W. Partridge the structural alterations. The designs for the whole of the work were by Mr. A. S. Parker, architect, Plymouth.

Weston-super-Mare. — The foundation stone of Weston-super-Mare Free Library and Museum was laid recently. The estimated cost of the building is £6,000. The first section will consist of two stories, and will occupy an area of some 3,000 square feet. The ground floor accommodation comprises a ladies' room, librarian's room, reading room, lending and reference departments, and the entrance hall; also lavatory accommodation for both sexes. The museum and picture gallery will occupy the upper floor, and will be approached by a wide staircase. The building will have fireproof floors and staircases. The materials employed in the structure will be local blue stone up to the plinth level, and red Cattybrook bricks relieved by freestone dressings and carvings. Messrs. Hans F. Price and Wilde and Fry, of Weston-super-Mare, are the joint architects, and Mr. Charles Addicott is the contractor.

Wigan.—The New Royal Court Theatre has been remodelled from designs by Mr. John P. Briggs, of Effingham House, Arundel Street, W.C. The entire auditorium has been gutted and reconstructed. The dress and family circles are entered from King Street. A glass canopy has been erected along the whole of the front of the theatre for protection in inclement weather. The two tiers are supported by iron columns, and the sight lines have been carefully worked out to enable every occupant to obtain a clear and uninterrupted view of the stage. The foyer, dress circles, and bar saloons have been decorated and placed well away from the auditorium. A complete installation of electric light has been erected. The decoration of the theatre has been carried out in French Renaissance style. The prevailing tints are cream, buff and gold, relieved by rose-pink and smoky blues. The centre portion of the ceiling is domed and divided with open scrolls, worked with bold cornices and enrichments. The proscenium opening is flanked on each side with an enriched frame from which springs ornamental bracketing. The walls of the auditorium are covered with Japanese paper. The joinery work has been done by Messrs. Lomax Bros., of Platt Bridge; the foyer and saloons, seating, upholstering, fibrous plaster, draperies, and general decoration of the auditorium and saloons have been carried out by Messrs. A. R. Dean, Ltd., of Birmingham and London; electric light installation by the Corlett Electrical Engineering Co., Wigan and Newcastle; and the grand entrance and general painting by Messrs. Lea and Sons, Rodney Street, Wigan.

Tennyson Memorial.—At the beginning of last week the Bishop of Ripon unveiled a window which has been placed in Haslemere Parish Church, as a memorial to the late Lord Tennyson. The subject of the window, which has been adapted from a design by the late Sir E. Burne-Jones, is "The Attainment," and represents Sir Galahad at the little chapel where the vision of the Holy Grail first comes to him.

The Leaning Tower at Wendlebury, which is attached to the old church, is to be pulled down. The church dates back quite 600 years, and its leaning tower at one time caused a good deal of discussion, but an examination showed that its declination from the perpendicular arose, not from any intention of the architect, but from subsidence. Lately it got so much worse that it is considered dangerous, and as underpinning is impracticable, it will be pulled down.

Proposed New Municipal Buildings for Walsall.—The report of a special committee of the Town Council, who have under their consideration the proposal to erect municipal buildings in Lichfield Street, recommends the erection of a town hall, municipal offices, and a public hall. The total cost of the scheme is considered to be about £55,000. The advisability of including an art gallery was considered, but the committee came to the conclusion that the outlay could not at present be afforded, although ample space would be left on which to erect an art gallery at some future date.

Ventnor Consumption Hospital.—The new Battenberg block of the Royal National Hospital for Consumption was opened last Wednesday by Princess Henry of Battenberg. The block, which comprises three houses, provides for the accommodation of twenty-one additional patients in as many separate sleeping apartments, all facing the south, the sitting-rooms (also facing the south) being in the proportion of one room for seven patients. The building was commenced in 1897, from designs by Mr. Theodore Saunders, architect, of Ventnor, and contains many improvements upon the old blocks.

New Patents.

The following abridged description is specially drawn for the Builders' Journal and Architectural Record *by Messrs. Hughes and Young, Patent Agents, 55 and 56, Chancery Lane, London, W.C., who will give advice and assistance free to our readers on all patent matters.*

988. Door Knobs, Attaching.—Patentee: C. A. Conder, of Elm Park Road, Finchley, N. —The lock spindle is of angular section, and fits into a corresponding hole in the handle. The spindle is screwed on its edges to receive a rose. The inner end of the handle and the part of the rose are externally screwed, and are connected, when adjusted in proximity, by a union. Rotation of the rose is prevented by some such engaging device as pins and holes, and the union is locked in its tightened position by a pin on a spring ring engaging a recess in the union. The pin can be pressed out of engagement when it is desired to unscrew the union. The other handle may be attached in a similar manner, or may be a plain fixed handle.

7,284. Fastenings and Furniture for Windows, Doors, &c.—Patentees: T. Burgess, of Thomas Street, and J. J. Burgess, of Fox Street, both in Congleton, Chester. A guide bracket fixed to the framework supports a sliding bolt. A worm mounted on a spindle on the bracket engages with a rack on the bolt. By rotating the worm the bolt is moved either into or out of the hole in the hasp or staple, the bolt abutting against the back of the hasp and staple, and so preventing rattling of the parts fastened. Used as a blind-cord adjustment, the bolt described above is fitted at one end with a knob or pulley, round which the cord is passed.

7,297. Moulding Bricks, Tiles, &c.—Patentee: R. Stanley, of Manor Court, Nuneaton, Warwickshire.—Moulding bricks, tiles, paving blocks, fuel, &c. The cam, which is mounted on the power-driven shaft, acts upon two rollers carried by frames connected by four slide rods; the rods are also united at the bottom by a frame. The cam is so shaped that it moves down the upper die plunger to compress the material in the die box, then raises it slightly, and finally lowers it still further; meanwhile the lower die plunger remains stationary, resting upon a fixed bridge piece, but spring supports of the die box are withdrawn, as the die nears the bottom of its stroke, by rods actuated by cams, and the die box is pushed downwards by pressure blocks. The feed box is also reciprocated by the cam by the gear shown. When the crosshead comes to its lowest position it is automatically latched to the spindle of the lower plunger, and on rising lifts the die with it and discharges the pressed article. Projections on the rods then lift the die box to its normal position, and a plate actuated by the feed box releases the latch connecting the crosshead and plunger so that the latter falls back upon the bridge. A screw adjustment allows the plunger to be raised above the bridge, when the crosshead is in its highest position, to regulate the amount of material received in the die box. To ensure the descent of the plunger when released, it is connected by a chain passing over a pulley to the operating lever of the plate; the chain is drawn tight as the feed box nears the end of its forward stroke. For forming perforated bricks, &c., the bridge carries a number of perforating-rods passing through the plunger and die and adapted to enter sockets in the die as it descends.

A New Wesleyan Church at Worthing is being erected in the Gothic style. The foundation stone was laid last Wednesday. The church will accommodate about 600 persons, and on the right of its doorway will be a square tower terminating at a height of 70ft. in an octagonal carved pinnacle.

Keystones.

The Bells of Bere Ferrers Church have been rehung at a cost of £112.

The Collossal Statue of Ferdinand de Lesseps, the work of Frémiet, has been cast.

The Grand Hotel Continental at Cairo is now being erected from the designs of M. Francesco Battigelli, architect.

A Stained-Glass Window, which has cost about £60, has just been placed on the north side of St. Paul's Church, Brighlington.

New Schools for the Enfield School Board are to be erected from plans by Mr. G. E. T. Lawrence, of 181, Queen Victoria Street, E.C.

The New Hospital at Millport is estimated to cost about £4,000. The ceremony of cutting the first sod took place last Wednesday.

A New Wesleyan Chapel is to be built in Parchmore Road, Thornton Heath, according to designs by Mr. F. Ledger, of 8, Philpot Lane, E.C.

Lauderdale House, Aldersgate Street, E.C., has been pulled down in order to give place to business premises of a more modern character.

A Free Picture Exhibition at Deptford will be opened at Sayes Court Hall on August 21st, and will remain open until September 3rd, Sundays included.

The Statue of the Duc d'Aumale by Gérôme, will be erected at Chantilly, at the end of September. The pedestal has been designed by M. Daumet.

The Members of the Sussex Archæological Society held their annual excursion last Thursday and spent a very pleasant time touring through West Sussex.

A New School is to be erected in Silver Street, Upper Edmonton, by the Edmonton School Board, from plans by Mr. H. W. Dobb, of 54 and 55, London Wall, E.C.

A New Wesleyan Chapel and Schools are about to be erected at Sandgate from designs by Messrs. Gordon, Lowther, and Gunten, of Finsbury House, Blomfield Street, E.C.

The Monument to Victor Hugo by Barrias, which it is proposed to erect at Paris in the square bearing the name of the great poet, will not be ready for three years.

The New Park at Benwell was opened last Wednesday by Mrs. Hodgkin. The park is the gift of Dr. Thomas Hodgkin to the people of Benwell, which is a suburb of Newcastle.

A New Fever Hospital for Perthshire is to be erected at Burghmuir. The contractors are Messrs. Spiers and Co., engineers, of Glasgow, and the total cost of the building is expected to be about £3,000.

New Factory Buildings, in connection with the Electric Railway and Tramway Carriage Works, Limited, Preston, Lancashire, are being erected on "The Marsh" by Messrs. T. Croft and Sons, from plans by Messrs. Garlick and Sykes.

Munificent Gift to Keighley. — Mr. Andrew Carnegie has expressed his willingness to give £10,000 to Keighley for a free library if the town will provide a site and adopt the Free Libraries Act. The offer has been cordially accepted.

Mr. Edwin O. Sachs has moved his general and private offices from No. 11, to No. 3, Waterloo Place, Pall Mall, to which address all communications should in future be directed. Mr. Sachs' telephone numbers are :—Nos. 5164 and 5165 "Gerrard."

New Church Hall at Newcastle.—At a meeting of the Town Improvements Committee of the Newcastle Corporation last Wednesday plans were submitted for the building of a church hall, &c., in connection with Blackett Street Presbyterian Church, on ground adjacent to College Road. The committee decided to make a survey of the site, and again consider the matter at their next meeting.

The Newcastle Society of Antiquaries recently visited the residence of Mr. Robert C. Clephan, South Dene Tower, Low Fell, to inspect his interesting collection of ancient weapons and defensive armour, and to hear a paper read about them.

A Fire at Sheffield Fever Hospital.—While painters were at work last Thursday on one of the administrative blocks the flame from one of their benzoline lamps set fire to the tar felt lining between the double wooden walls. There was no loss of life.

The New Smallpox Hospital at Leeds is to be built from plans by Mr. E. T. Hall, of London. It will accommodate 104 patients, and will consist of three large pavilions and two small isolated pavilions. The cost of the buildings is estimated at £61,781.

The Memorial Stones of a New Infant Department of the Sunday School at Wombwell were laid last week. The style of architecture is Early English, and the building will be of brick. Mr. A. B. Linford, of Wombwell, is the architect. The contracts are let for the sum of £506.

The Restoration of York Minster.—The fund for the restoration of York Minster now reaches £11,792 10s. 10d. The restoration of the east end will be finished in a few weeks, and as soon as the scaffolding at the west front is completed the restoration of the stonework will be commenced.

Quarry Accident at Thornton.—Last Wednesday morning a youth, named Irvine Robertshaw, met with an accident at Law Quarry. He was hewing a stone on a banker, when the banker gave way, rolling the stone suddenly on to his leg. His leg was severely crushed, and the bone broken above the knee.

A New Bank at Stratford-on-Avon.—The new banking premises of Lloyds, Ltd., at the corner of Bridge Street and Union Street, have been erected at a cost of about £6,000. Messrs. J. A. Chatwin and Sons, of Birmingham, are the architects, and Messrs. Collins and Godfrey, of Tewkesbury, are the builders.

The Millais Memorial.—A report by the Millais Memorial Sub-Committee issued last week shows that up to July 27th the subscriptions received amounted in the aggregate to £2,100 3s. The intention is to erect a bronze statue of the late Sir John Millais in front of the Tate Gallery. Mr. Thomas Brock, R.A., is the sculptor.

The Foundation Stone of a New Parish Room at Christ Church, Tunbridge Wells, was laid recently. The new building is to be of white brick, and will cost about £1,200. The parish room will be 55ft. by 25ft. with a class-room and kitchen at the rear. Messrs. Cronk are the architects, and Messrs. Strange are the contractors.

A Statue of the Virgin Mary is to be erected on the peak of Rocciamelone in the Italian Alps. This peak is always covered by snow and is 3,537 metres above the sea level. Queen Marguerite, of Italy, who has started the subscription list, will unveil the statue this month. The statue is the work of the sculptor Stuardi, and will be cast in bronze.

Gas and Allied Trades Exhibition.—The first annual Gas and Allied Trades Exhibition is announced to be held at the Royal Aquarium, Westminster, S.W., from Thursday, December 21st, 1899, to Tuesday, January 23rd, 1900. Mr. Josiah Ritchie is the president and managing director, and Messrs. M. J. G. Ritchie and T. G. S. Hersey are the organizers.

The Opening of a New Park and Hospital at Hebburn took place last week. The park is situated in the south of the town. The cost of the park is about £4,000, and the work has been carried out by Messrs. Cowper and Henderson, contractors, Jarrow, under the supervision of Mr. J. B. Renton, the surveyor. The hospital stands upon two acres of ground, and consists of administration block and wards. It is intended to accommodate about thirty patients. This building has been erected by Messrs. Cowper and Henderson, Jarrow, at a cost of £4,000, according to plans by Mr. J. B. Renton.

Extensions at the Keighley Workhouse.—The Keighley Board of Guardians at their meeting last Wednesday accepted tenders for the enlargement of the board-room, offices, and dining-hall at the workhouse, amounting to £1,144 16s. 11d. The individual contractors are :—Masonry, Mr. Edward Smith, Keighley; joinery, Mr. Ineson Taylor, Cross Roads; slating, Mr. Thomas Nelson, Bradford; plastering, Messrs. H. Spurr and Sons, Bingley; plumbing, Mr. J. Harrison, Keighley.

The New Stained-Glass Window in Dunbar Parish Church was designed and executed by Mr. Edward Frampton, of London. The window occupies the centre of the apse looking eastwards. On the tracery are figures of Faith, Hope, and Charity, and below is a six-light window, the three upper lights representing the Ascension, and the three bottom lights the Nativity.

The New Church at Stanton Hill, the foundation stone of which was recently laid by the Dowager Countess of Carnarvon, is to cost about £1400. Seating for 360 persons will be provided, and there will be nave, chancel, vestry, organ chamber, and west porch. The roof is to be open timbered, covered with red tiles, and surmounted with a small belfry. The architect is Mr. Percy H. Curry, of Derby, and the builder is Mr. R. Wilson, Skegby.

Tablet to Shakespeare.—It is proposed to erect a tablet to Shakespeare on the New Post Office Savings Bank, the ponderous pile of buildings running back from Queen Victoria Street to Carter Lane. The tablet will bear the following inscription: "Upon this site formerly stood the 'Bell in Carter Lane,' from whence Richard Quiney wrote the letter to William Shakespeare, dated the 25th October, 1598. This is the only letter extant addressed to Shakespeare, and the original is preserved in the Museum at his birthplace, Stratford-upon-Avon. This tablet was placed upon the present building by leave of the Postmaster-General, 1899."

The Atbara Bridge Contracts. — The reason the Americans obtained the contract for the superstructure at the Atbara Bridge is stated to be because the English could not do it quickly. This statement is contained in a Parliamentary paper just issued. Lieut.-Col. Gordon, who was asked to report on the circumstances of the contract, says, in his despatch, that the whole question was one of quick delivery For the final specification only one English firm made any offer, and that was the Patent Shaft and Axle Co., who required six months. The Pencoyd Iron Works, of Philadelphia, undertook complete delivery in six weeks and secured the order. Lieut.-Col. Gordon, in his despatch says: "I wonder that comment has not been made on the fact that the more expensive portion of the bridge was contracted for by an Italian firm; the answer to this being that there is only this single firm in Egypt possessing the required plant for sinking cylinders, &c., and until a British firm sets up a plant in this country I conclude that all bridges whose sub-structures are built as those of the Atbara and others will continue to be contracted for by this Italian firm."

A Canadian Engineering Feat.—The River St. Lawrence at the Travers is eight to nine miles wide, and it has been decided to substitute a lighthouse for the lightship which at present acts as a guide. The establishing of a foundation in 45ft. of tide-water was found to be no easy task, and to accomplish it a large pier was built of heavy timbers filled with rock and sunk on a bed prepared with stone. The pier was held in position by heavy anchors and by five steamers. It was then a stationary block upon which the superstructure could be raised. The next thing was to secure permanently the stationary block by surrounding it with masses of stone, and immense quantities were sunk, forming a protection which is confidently expected to prove solid enough to resist the heaviest weather. The stationary block is 28ft. deep, and at low tide is in 26ft. of water. The superstructure will stand 30ft. out of the water at high tide

Quarries: PETERHEAD, N.B.

LONDON, S.E.—For rebuilding the "Masons' Arms," Besson-street, New Cross, S.E., and shops and flats adjoining, for the Forest Hill Brewery Company. Mr. W. M. Brutton, architect, 5, Green-street, Leicester-square, W.C.:—

Structural.

Hooper and Son	£1,215	J. Byrne*...	£1,030
Pritchard and Renwick	1,094		

Fittings.

Burman and Son ...	£280 0	Hooper and Son... ...	£225 0
Pritchard and Renwick	232 0	Byrne	167 10

Pewtering.

H. and F. Warne ...	£56 0	McPherson	£34 10
R. E. Lane	42 0		

Gasfittings.

A. Nathan	£63 10 0	Biggs and Co.... ...	£52 7 6

*Accepted.

LONDON.—For the substructure of Kennington (St. Gabriel's) College for training mistresses, for the executive committee. Quantities by Messrs. J. Leaning and Sons, Bedford-row. Mr. Philip A. Robson, architect, Palace Chambers, 9, Bridge-street, Westminster:—

Norris and Son	£3,795	Parnell and Son	£3,408
Dove Bros.	3,555	Garrett and Son* ...	3,200

For the Superstructure (with certain exceptions).

Parnell and Son... ...	£31,368	Lawrance and Son ...	£31,368
Patman and Fotheringham	31,980	Foster and Dicksee ...	30,780
		Garrett and Son* ...	30,565

* Accepted.

LONDON.—For new footbridge over the North London Railway, Poplar, for the Board of Works for the Poplar District. Mr. Oliver E. Winter, Engineer. Quantities by Mr. Jno. R. Hunt, Bridge House, 181, Queen Victoria-street, E.C.:—

For Brick and Stone Abutments.

Dolman and Co.	£1,498	Engineer's estimate ...	£1,138

For Steel Bridge.

Matthew Shaw and Co.	£1,314	Jukes, Coulson, & Co.	£1,036

[Engineer's estimate, £905.]

LONDON, E.—New underground convenience, Bow-road, E., for the Board of Works for the Poplar District. Mr. Oliver E. Winter, Engineer. Quantities by Mr. Jno. R. Hunt, Bridge House, 181, Queen Victoria-street, E.C.:—

Dolman and Co.	£2,100	W. Johnson*	£1,700
Jennings and Co. ...	2,050	Finch and Co.	1,689
Thomas and Edge ...	1,927	* Accepted.	
A. E. Symes	1,915	[Engineer's estimate	1,900]

LONDON, S.W.—For the erection of a sub-station for the Chelsea Electricity Supply Company, Limited, at Milner-street, Chelsea. Mr. Alfred Roberts, architect, 18, Nelson-street, Greenwich, S.E.:—

Higgs and Hill	£5,124	F. and H. F. Higgs ...	£4,617
Killby and Gayford ...	4,694	Holliday & Greenwood	4,544
B. E. Nightingale ...	4,635	Lole and Lightfoot*...	4,496

*Accepted.

LONDON, S.W.—For repairs and decorations at No. 59, Christchurch-road, Streatham-hill, S.W., for Mrs. Annie Slade-Jones. Messrs. Clarke and Hutchinson, architects, 28, John-street, Bedford-row, W.C.:—

J. Selway and Sons ...	£263	Chas H. Marrison	£176
Crabb and Son...	203	Philip Clark*	145

* Accepted.

LONDON, S.E.—Accepted for the rebuilding of shop and premises, No. 911, Old Kent-road, S.E., for Mrs. M. A. Chalk-Caterham, Surrey. J. Halsted Waterworth, architect and surveyor, 281A, Queen's-road, New Cross Gate, S.E.:—

Sidney R. Best, Brockley £751

THE VENTILATION OF SEWERS AND DRAINS.*

By R. READ, Assoc.M.Inst.C.E.

(Concluded from page iv., No. CCXXXV.)

At the Westminster district meeting of this Association in February, 1898, an important discussion occurred upon the subject of sewer ventilation, with a view to deciding the course of action to be taken by the metropolitan surveyors at a conference which had been arranged between them and the medical officers of health to the London vestries. At this district meeting, two propositions were discussed, the one to increase the number of the road surface ventilators, by placing them every 50yds. apart on the sewers, and the other to pass a law compelling every building owner in future to provide a shaft in the front of his house, to ventilate the drain on the sewer side of the interceptor. After considerable discussion both propositions were carried, and at the conference afterwards held with the medical officers of health, Sir Alexander Binney in the chair, the shaft proposal was adopted for recommendation to the London County Council.

Proposed Reforms Criticised.

These two propositions are somewhat destructive of each other, because the ventilation will take place in the direction of the line of least resistance, and if you increase the number and area of the road surface gratings in proportion to the outlet shafts above the houses, you weaken the velocity and get a liability to stagnation or reversal of current, owing to its feebleness; that is to say, the greater the number of shafts between each pair of manholes, the stronger is the initial velocity of the air entering the manhole gratings, especially if the latter are kept small; and a strong initial velocity at the road surface inlet is necessary to enable the current to reach the furthest outlet shaft between the two inlets. To take an ordinary example in a suburban district, in a distance of 100yds between a pair of manholes, it is possible to have fifteen houses on each side of the street, and if each house drain was ventilated by a 4in. soil pipe carried up above the roof, the sum of their outlet areas would be 12½ square inches by 30=375 square inches. These would all be drawing air in at the upper manhole, having, say, 36 square inches of surface grating openings, or a ratio of more than ten to one in favour of the shafts being outlets; and a velocity of, say, 1ft. per second discharging from the thirty outlet shafts, would cause the air to enter the 36 square inches of manhole grating at the road surface, with a velocity of not less than 10ft. per second,—without any allowance for friction through the pipes. There is no occasion for alarm at this proposition, as the popular idea that the more ventilation the more sewer gas is entirely wrong, because the more perfect the ventilation the less sewer gas is formed. The proposal agreed to by the London Conference increases the number of ventilating shafts to be provided by the house owner while retaining the intercepting trap, and is a compromise which does not strike at the root of the evil; the owner is more likely to consent to abolish the trap as it would be less expensive to him, and in the author's opinion more beneficial both to the owner and the community at large. The soundness of the drain should be tested when the trap is taken out, especially if the drain passes under a house.

Need for Fresh Air.

Decomposition is the fate of all organic matter, and if this takes place in a confined space with imperfect ventilation, putrefaction is the result, as distinguished from decomposition, but in the presence of an abundance of fresh air or oxygen, decomposition is effected without producing a nuisance. But, as has before been stated, the sewage itself should not remain long enough in a sewer to decompose, and the only thing which the ventilation has to deal with in a system of well designed and constructed sewers and drains is the vapour-laden air, and it is to prevent this from becoming putrified by stagnation that the ventilation is absolutely necessary. As an illustration of this a considerable quantity of manure can be spread on a garden in the open air without creating a nuisance, but a very small quantity indeed shut up in cupboard would make any house untenable.

Conclusion.

Good ventilation cannot be obtained by surface gratings only, nor by shafts only, especially if the latter consist of one 6in. shaft at the top end of the sewer, but it can only be obtained by a combination of both proportioned and located in the manner described by the author. Then come in the legal and sentimental difficulties, because the law says the sewers belong to the local authority and the drains belong to the householder, and must be treated separately; but this is contrary to the great laws of Nature which govern the subject, and so long as this antagonism exists, so long shall we have complaints of sewer gas.

---

* A paper read at the annual meeting of the Incorporated Association of Municipal and County Engineers, held at Cardiff, June 29th, June 30th, and July 1st, 1899.

SANITARY INSPECTORS' CONFERENCE AND HEALTH EXHIBITION.

BY OUR SPECIAL CORRESPONDENT.

LINCOLN was this year selected by the Sanitary Inspectors as the city wherein to hold their annual congress, and the worthy Mayor (Alderman Wyatt), ably assisted by the City Member (Mr. C. H. Seely, M.P.), the City Sherriff (Mr. J. H. Foster), Dean Wickham, Dr. Lowe, and the City Council, gave the Congress a right royal welcome; and everything possible was done for the comfort and pleasure of the visitors.

The conference opened on August 3rd with a reception in the Guildhall, after which Mr. T. J. Moss-Flower, C.E., M.S.I., the Chairman of the Sanitary Inspectors' Association, in the absence, owing to illness, of the President (Sir John Hutton), read the annual address, of which the following are a few of the salient points:—

The Association's Work.

The Association was founded in 1883, incorporated in 1891, and the membership now numbers upwards of 700. There are five branches operating in various parts of England, from the extreme south-west to the farthest northern portion. It is expected that a branch for Ireland will be shortly formed. In addition to several other committees for carrying on the work of the Association, there is a Parliamentary Committee, the duties of which are to carefully watch all Bills brought into the House of Parliament which in any way bear upon the work of sanitary inspectors; these are carefully examined and the progress they make carefully noted, and when it appears to the committee, acting on instructions from the Council, that amendments or modifications of them are necessary, representations pointing such out, are made to the proper authorities; members of Parliament are interviewed by deputation and otherwise, and other action is taken according to the requirements of the case. A scheme for benevolent fund has been prepared and it is expected that either in its present form or as may be modified by the Council, it will be approved. The fund does not partake of the nature of a sick benefit fund, nor is it to be in any way dependent on the funds of the Association. It is to be supported by voluntary contributions from the members, donations, bequests, &c. The object of the fund is to give relief in necessitous cases to sanitary inspectors, or to their wives and families, in times of distress. Thus it will be seen that the Association is doing a very useful work, and such as must commend itself to all who are desirous of preaching and practising the "Gospel of Health."

The Modern Sanitary Inspector.

The time for the old-fashioned inspector has passed. What is now required is a man with a good knowledge of a very large number of subjects, in many of which he must be expert. He must have a good knowledge of the various Acts of Parliament affecting his duties—including Public Health Acts, Food and Drugs Acts, Infectious Diseases Notification Act, drainage by-laws, factory Acts, and all the by-laws and regulations affecting slaughter-houses, dairies, farms, milkshops, offensive trades, canal boats, tents, vans, sheds, and similar structures, and other special premises. He must also have an expert knowledge of drainage, plumbers' work, ventilation, sanitary appliances, water supply to houses, and the sanitary requirements of all classes of dwellings, and many other things too numerous to mention. In addition, he must possess a good nose, and a keen sight: must be resourceful, diplomatic, courteous—sympathetic when dealing with poor people, firm when dealing with unscrupulous evaders of the law—qualities probably necessary in all walks of life, but most essential characteristics to make a good sanitary inspector.

His Relations with Local Bodies.

It is no doubt strange to many, though nevertheless true, that most of the sanitary inspectors throughout the country are elected only for twelve months at a time, and it is left entirely in these cases to the goodwill of the council whether they will elect them again after the expiration of their term of office; and there are many cases on record where great injustice has been done to an officer who has been a little too exacting in his requirements to please certain property owners who are on the council, and he therefore makes enemies of these men, and should they be in a majority on the council, then he has to go, or be subject to no end of tyranny. It is believed, therefore, that the public health suffers by reason of the inspectors being unable to properly carry out their duties for fear of loss of office. We are now seeking to get passed through Parliament a Bill to give to sanitary inspectors secure tenure of office, and we hope that the Town Council of Lincoln will support us in this matter, by requesting their Parliamentary representatives to support the Bill when introduced to the House.

Women as Sanitary Inspectors.

There is one thing I think we should all hail with delight, and that is the appointment of women as sanitary inspectors in some of the larger towns. I do not mean to say that women are fit and capable of discharging the whole of the duties, which under the present legislation men inspectors have to perform, but there are certain spheres of labour in which they can do excellent work, work which cannot be done by men. In inspecting the homes of the poorer classes, and instructing the inmates in the rudiments of the laws of health, cooking, nursing, and the proper care of children, &c., there is much that women can do.

Public Health Acts.

We have been hoping to see some signs of the probability of the unification or consolidation of the various Public Health Acts in one single Statute, with the repeals and amendments, so desirable in the interest of the public health, embodied therein. It is now twenty-four years since the General Act for England and Wales was passed. Since then there have been numerous additions and alterations. I will not, however, weary you by reciting them. It will no doubt be sufficient for me to say that it is most difficult for any one not having a trained legal mind to grasp the meaning and intention of the legislators, and there have been known instances where even legal minds have failed to grasp the meaning. But an inspector, in order to carry out his duties promptly, must clearly know what are his legal rights, powers, &c., and this knowledge, under present conditions, is most difficult for him to acquire. What is wanted is, as I have already said, one comprehensive—yet very clearly worded—Public Health Act, to displace the many bits of Acts we now have.

How the Acts are Evaded.

I am prepared to admit that many of the requirements of the Public Health Acts in many districts are a dead letter. The laws of the land are evaded right and left by the local authorities throughout the land, not so much the Town Councils, but more particularly by the smaller District Councils in rural and semi-rural districts. I could cite numberless cases of evasion if time permitted. I will just take one instance, and this occurs in districts where the inspector and surveyor is one and the same man. The salary perhaps is £150 per annum—£130 as sanitary inspector and £20 as surveyor. The surveyor's work includes, among many other duties, that of superintending the cleansing and repairing of all roads within his district, looking after, preparing, extending or amending sewerage schemes, sewage disposal works, water works, and other similar works, examining plans of new buildings, seeing to the erection of buildings, looking after men, paying wages, keeping a lot of books—many of them unnecessary—&c., &c.; for all this he gets £20 per annum. In many instances he is engaged nearly the whole of his time, and the little time he can spare from his duties as surveyor he gives to the hundred and one things required of him as sanitary inspector, and the result is that the sanitary inspector's work gets neglected.

More Officers Needed.

Now, the point is this, he gets £130 per annum for the little work he does as sanitary inspector. In other words, he gets thirteen-fifteenths of his salary for doing what takes him two-fifteenths of his time, and two-fifteenths of his salary for doing what takes the remaining thirteen-fifteenths of his time. Why not put £130 down for performing his duties as surveyor and £20 as inspector? The reason for doing this is, the Local Government Board allows from the County Council a remittance to the officer's District Council of half the amount paid to him for performing the duties of sanitary inspector. So that by making the inspector's salary £130, the District Council pockets £65, whereas, if the salary attached to the sanitary inspector's office was £20, they would only get £10 returned. Thus the intentions of the legislators are defeated, and many districts which are thought to be subject to efficient sanitary inspection, get very little. The remedy is to separate the offices or furnish the chief official with qualified assistants to perform the necessary inspection. It may well be said then, that what is required now more than increased legislation, is a more effectual carrying out of the present Acts of Parliament, which as I have already said, are lying dormant in many districts. Truly, there are not enough officers employed to do what is required. There is many a district in this country which satisfies its conscience by allowing its sanitary authority to employ a man to give a part of his time at a salary of from £20 to £50 per annum. A separate Health Department, with a Minister with Cabinet rank at its head, might deal successfully with important matters of this kind, and it is hoped that such a Department may soon be established.

The Health Exhibition.

Later in the day the Health Exhibition was opened by the chairman of the District Council (Mr. W. Embleton-Fox), supported by the Mayor, the Dean, the city member, and other influential citizens. In the evening the Mayor gave a garden party at the Arboretum, which was well attended by the visitors and many of the leading citizens of Lincoln.

The exhibition consisted of fifty-eight stands of trade exhibits, besides which there was on view a most interesting and instructive loan exhibition, contributed to by Dr. Wight Mason, medical officer of health for Hull, Prof. Windbe, of Mason's College, Birmingham, Dr. Robertson, health officer, Sheffield, Dr. Carline, of Lincoln, and others. We noticed many old exhibitors, whose specialities have on previous occasions been favourably noticed in our columns; one or two new features, however, merit a few words.

Messrs. J. F. Ebner, of 150, Old Street, London, E.C., showed some excellent samples of oak flooring, laid direct on the concrete bed by a patent hydrofuge system. This exhibit had already done duty at the Chicago Exhibition, where it obtained the highest award for ingenuity and efficiency.

The Sanitas Co., Ltd., of Bethnal Green, had a large and varied display of their various excellent preparations, which were much admired.

Messrs. Tomlinson and Hayward, of Lincoln, also had an interesting display of their specialities, such as disinfectants, &c., and also their butter powder and Danish Butter Colour—vegetable compounds for which they claim fifty years' successful use.

Messrs. Peter Spence and Sons, of Manchester, had a large and varied display of aluminoferric, and their many extracts from sewage sludge, such as "Concentrated Fertiliser," sewage effluent, &c.

Messrs. Burroughs and Welcome had a very handy, and most useful, "Water Analysis Case."

Messrs. Twyford, Limited, of Hanley, whose various exhibits occupied nearly half the large hall, were drawing particular attention to their sinks, slop hoppers, and wash tubs. A most interesting and, to our mind, useful exhibit, was their doctor's sink and wash basin, so constructed that by a system of pedals the hot or cold water, disinfecting tap, or waste pipe, could be turned on or off, thus avoiding the necessity of the hands coming in contact with any part of the basin or taps until thoroughly disinfected and washed, a most important factor in the case of operations, &c., in a large hospital or infirmary. Great interest was shown by many of the inspectors in the slop hoppers also exhibited at this stand. The simplicity of work was specially noticed, and the perfect prevention given to the possibility of sink pipes becoming fouled or choked by refuse carelessly thrown with slops into the sinks. Messrs. Twyford's adamant urinals, Twycliffe syphonic, and other wash-down closets are too well known for us to mention them further. This stand, No. 12, was decidedly one of the best features of the exhibition.

Messrs. Oates and Green, Ltd., of Halifax, had a good display of their salt-glazed ware, and a large variety of pipes, gullies, feeding troughs, and wash tubs. To this firm has been awarded the silver medal, the highest award, for general excellence of sanitary exhibits.

The Septic Tank Syndicate were again to the fore. We were pleased to notice that their present model is a great improvement on that which we saw at Birmingham last year. The process seems simplified, and is certainly more easily appreciated by interested visitors.

The Wade Disinfectant Syndicate, who seem to contract for and supply all branches of the Government, had a varied display of their simple closet automatic disinfector, patent sulphur candles with asbestos covering, and other popular and powerful germ killers.

Messrs. Doulton and Co., Limited, who also had a large exhibit, were showing some handsome ware and vases, mantlepieces, tiles, &c., in addition to their usual display of baths to meet all classes and requirements.

Messrs. Battle, Maltby, and Bower, Lincoln, showed a large assortment of fluid and powder disinfectants, fumigating powder, carbolic soaps, &c.

Mr. Chas. Duckering, Waterside Works, Lincoln, had an excellent collection of their various goods, such as mantlepieces, grates, stoves, fenders, &c., all finished in the highest style. One open and close kitchener deserves special notice, with its bright fittings, tiled covings, tiled oven bracket shelf, adjustable bottom grate with tile hearth and curb complete.

Edinburgh Glaziers have obtained the advance asked for, of ½d. per hour on their wages. The standard wage is now 8½d. per hour.

Masters and Men.

The Strike of Joiners at Huddersfield is now over. At a recent meeting the joiners of Huddersfield and district considered a report as to a meeting of the representatives of the men and the employers on the previous Thursday, and to determine whether the terms of settlement provisionally agreed upon should be accepted. After discussing the matter for nearly two hours the terms were unanimously ratified. The men's demand for an advance of ¾d. per hour is acceded to, making their wages now 8½d. per hour. The men resumed work last Wednesday.

The Danish Labour War.—At a general meeting, last Monday week, of the representatives of the trade unions affected by the great lock-out in Copenhagen it was decided, after eight hours' debate, to accept the draft of a general settlement arranged by the Presidents of the Employers' Federation and the Joiners' Union, 128 votes being given in favour of its acceptance, and 99 against it. The reservation was, however, made that the points in dispute in the joiners' trade should first be settled in detail, and that no workshop regulations should be introduced without a consultation between the mens' and the employers' organisations. The directors of the Employers' Federation last Wednesday informed the trade unions affected by the lock-out that the reservations made at the general meeting could not be accepted, and that the lock-out could not be ended until they had been withdrawn.

The Building Trade Dispute.—In accordance with a suggestion made at the conference in London just over a fortnight ago, a meeting between representatives of the Yorkshire Federation of Building Trade Employers and representatives of the London Order of Bricklayers was held at Leeds at the beginning of last week. The masters were represented by Mr. W. Nicholson and Mr. Henry Hodgson (Leeds), Mr. G. H. Walters and Mr. T. Goates (Hull), Mr. Mansfield (York), and Mr. Ullathorne (Selby); while the delegates for the men were Mr. J. Batchelor (the general secretary of their order), Mr. Geo. Carr, and Mr. T. Newlove (Leeds), Mr. M. Emmerson (Hull), Mr. H. H. Diver (Sheffield), and Mr. C. Spence (York). Mr. Nicholson presided over the meeting, which lasted nearly five hours. Among the towns where disputes exist are Hull, Selby, Leeds, York, and Sheffield. The dispute was considered in all its phases and it was decided to make recommendations to the masters' and mens' unions concerned, with a view to arranging a settlement. A similiar conference between representatives of the Yorkshire Federation of Building Employers and representatives of the Amalgamated Society of Carpenters and Joiners was held at Leeds last Wednesday. Mr. Nicholson, of Leeds, presided, and the other masters present were Messrs. Bray and Marsden (Hull), Charnock (Halifax), Umpleby (Leeds), and Dawson (Huddersfield). The men were represented by Messrs. Wilson (Bolton), Chandley (Manchester), and Hall, Cuttell and Gould (Hull). The point which caused the greatest discussion was the refusal of the men to work with the imported non-society men. The masters state that the unions cannot supply them with sufficient men, and they are, therefore, obliged to use imported men. The disputes are both over the question of wages, while at Halifax the question of rules also enters. It was stated at the conclusion of the conference that the question of wages had been practically agreed to, on condition that the men would return to work with the imported men, and agree to minor local alterations of rules. The conference between master builders and representatives of the Bricklayers', Joiners', and other unions at Hull last Thursday was an abortive one. The meeting was in private, but we hear that both masters and men showed a very determined attitude.

Settlement of the Halifax Joiners' Strike Case.—The application for a perpetual injunction on the whole case of Charnock and others v. Court and others, the previous proceedings of which were reported in our issues of April 12th and 19th and July 26th, was considered at the West Riding Assizes last Tuesday week before Mr. Justice Grantham. Mr. Tindal Atkinson, for the plaintiffs, stated that the case had been settled. The effect of the arrangement which had been made was that the injunction applying to part of the case should be extended to the whole of the case, with certain additions which were to be agreed upon, and which would be handed in to the Associate to be entered up as judgment for a perpetual injunction against the defendants in respect to the matters included in the terms. It was understood that there were to be no costs allowed to either side. Mr. Lawson Walton, for the defendants, said his clients had been anxious to observe the law, and they were wishful to observe the law. Unfortunately there had been an industrial struggle at Halifax, lasting for some time, and although, so far as he could gather, there had been no suggestion of harsh or violent conduct, the line of policy which had been pursued by the union representing the men had, in some cases, no doubt, infringed the law, as defined by a recent decision. Mr. Justice Stirling, in a very careful judgment, gave his grounds for coming to the conclusion that, in one matter, the defendants had brought themselves within the operation of the law, having regard to the recent decision in the House of Lords. Mr. Walton said he felt the justice of that decision, and the defendants had no objection whatever to the order being made perpetual. Their wish was that their conduct should be strictly within legal limits, and, so far as they could do so, they intended to keep within those limits. Mr. Atkinson then applied for judgment for a perpetual injunction on terms agreed upon. His Lordship said he was aware that the case had been sent down by Mr. Justice Stirling, and that a perpetual injunction was sought. He was very glad that counsel had been enabled to arrive at an agreement, because, unquestionably, whilst there was a prospect of peace and goodwill between masters and men, which he hoped would be the outcome of the conference, it would be most unwise to embitter the feeling between them by going into the merits or demerits of that action. The special jury which had been empanelled for the hearing was then relieved from further attendance, and judgment was entered for a perpetual injunction on the terms agreed upon.

Hull Strike Case.—In the Chancery Division on July 21st, the case of Walters v. Green was heard by Mr. Justice Stirling. This was a motion launched on similar lines to those in the case of Charnock v. Court in regard to the Halifax Joiners' strike. It was to restrain defendants from watching or besetting Hull railway station and other places for the purpose of preventing persons engaged by the plaintiffs from working for them. Mr. Upjohn, Q.C., stated the case for the plaintiffs. Mr. Crawford, for the defendants, contended that the action was not properly constituted, and argued that it was against the rules of the Court for the plaintiffs to combine to bring the action. It was arranged that the statement of claim should be amended. At the resumed hearing on August 3rd, Mr. Upjohn stated that the statement of claim had been amended. Mr. Stewart Smith appeared for Hall and Cuttell, two of the defendants, and contended that there was an act of agency shown, or that they had authorised the acts of the other defendants. There were allegations that they were members of the trade union, but there was no evidence as to their responsibility for any of the acts done. Mr. Hartley, in dealing with the case for the other defendants, for whom he appeared, said there was no proof that the imported men would have worked for any of the plaintiffs whose names were on the record, or that the plaintiffs would suffer any damage by their leaving Hull. He submitted that unless the plaintiffs proved that these imported men were to be employed by one or other of the plaintiffs in the action, the plaintiffs could have no right of action against his clients. At the sitting on Wednesday last his lordship delivered his revised judgment. He said that amongst the defendants two were very prominent, Tighe and Emerson. The former, it seemed clear, had been guilty of acts which brought him within the Act. He appeared to have attended the railway station for the purpose of persuading men not to work for the plaintiffs and other members of the Builders' Association. It had been urged that all the defendants must be taken to be parties to the acts complained of, as trade unions were organised bodies, and these men were prominent members or officials. He could not, however, take any such view. Trade unions were lawful bodies, and *prima facie* their officers could not be presumed to have done, or authorised others to do, anything but what trade unions might lawfully do. The acts complained of had been proved against Tighe and Emerson alone, and he granted an injunction against them, similar to that which was granted in "Charnock *v.* Court."

Engineering Notes.

The Tender of Messrs. Dawson and Co., of 9, and 10, Pancras Lane, for the electric lighting of the city has been accepted by the Municipal Council of Port Louis, Mauritius.

The Tender of Messrs. Kerr, Stuart, and Co., of 20, Bucklersbury, E.C., has been accepted by the Wimbledon Urban District Council for the supply of 425 yards of 2ft. gauge tramlines, and six tip wagons.

The New Poplar Electric Lighting Works, the foundation stone of which was laid recently by Mr. Valentine, the chairman of the Electrical Committee of the Board, are to cost about £80,000. The mains will be laid through twenty miles of streets.

The Hambledon Schools, Henley-on-Thames, are being warmed and ventilated by means of Shorland's patent Manchester grates, patent exhaust roof ventilators, and inlet panels, supplied by Messrs. E. H. Shorland and Brother, of Manchester.

The Horsfall Furnace Syndicate, Limited, intimate that the growth of their business as engineers and contractors for refuse destructors, smokeless boiler furnaces, &c., has necessitated their removal to more commodious premises, which have been secured at No. 5, Greek Street, Leeds, where all communications for the head office should be addressed.

New Electric-Power Works at St. Helen's.—The formal opening of the extensive electric-power works erected by the St. Helen's Corporation, at Boundary Road, St. Helen's, was performed by the mayor (Colonel Pilkington, M.P.) at the beginning of last week. The new generating station has been erected in conjunction with the refuse destructor plant, the contract for the buildings having been placed in the hands of Messrs. John Rothwell and Sons, of St. Helen's.

Port Arthur Improvements.—The first works to be undertaken in the improvement of Port Arthur, for which the Russian Government has assigned a sum of 11,000,000 roubles, will be the construction of two moles and a considerable deepening of the dock, and afterwards of the roadstead and entrance channel. After these operations are completed, storehouses on a large scale are to be erected. The floating plant is to be increased, the existing dry dock lengthened, and the construction of a new one begun. The programme also includes the erection of a hospital, a church, houses for the commander and for the harbour officials, baths, warehouses, barracks, and dwelling houses for medical officers.

Alterations at Waterloo Station.—The extensive alterations which are shortly to be carried out at Waterloo Station will increase from 15½ to 23 acres the area covered by the terminus. Four additional platforms will bring the total to fifteen, and the length of platform facing lines will be increased from 3523 yards to 5737 yards. Seven passenger lines will be laid down in addition to the seventeen now existing. It is also intended to construct a new road of 60ft. in width for vehicular traffic entering and leaving the terminus. The total capital expended will probably amount to about £700,000.

Extension of Electricity Works at Halifax.—Last Wednesday night a special meeting of the Halifax Town Council in committee was held, presided over by the Mayor (Mr. J. T. Simpson), to sanction the application for tenders for the works required in extending the electricity works of the Corporation. Plans were produced by the architect, Mr. W. H. D. Horsfall, for making an addition to the present buildings. The new erection will be 100ft. long by 60ft. broad, and will be practically a doubling of the works. The additions will be capable of holding fully £60,000 worth of machinery, and the estimated cost of the building is about £3,700. The meeting passed unanimously a resolution sanctioning the application for tenders and proceeding with the works.

Bradford Extensions.—At the Bradford Town Hall last Wednesday an enquiry was held into the application to the Local Government Board by the Bradford Corporation for permission to borrow £67,500 under the Public Health Act of 1875 and the Electric Lighting Act of 1882, for the construction of a new Central Fire Station, and electric lighting and works extensions. For the new fire station £11,835 was needed for the purchase of land, and the station itself was to cost £12,390. The Corporation proposed to borrow £37,500 for electricity extensions, powers having already been obtained for £185,194 for electric works purposes. The bulk of the money now proposed to be borrowed would be expended in enlarging and improving the old and the new works; £10,000 would be devoted to new mains, and £1,790 to public lighting. The application was not opposed.

The Annual Meeting of the North of England Institute of Mining Mechanical Engineers was held on August 5th at the Wood Memorial Hall, Newcastle, Mr. W. Armstrong in the chair. The annual report stated that the net increase of membership was thirty-nine. The alterations and additions to the Wood Memorial Hall had been completed for about £2,200, a sum somewhat in excess of the estimated cost. The Finance Committee reported that the total receipts were, from July 1st, 1898, to June 30th, 1899, £3,943 8s. 2d. Of this amount £128 2s. was paid as life compositions in lieu of annual subscriptions, £86 2s. represented subscriptions paid in advance, and there was £1,150 withdrawn from the deposit account at the bankers, leaving £2,579 4s. 2d. as the ordinary income for the year. The ordinary expenditure amounted to £2,210 16s. 7d. There was also paid on account of the alterations to the Wood Memorial Hall, £1,900 12s. 6d., the total payments thus amounting to £4,111 9s. 1d. During the year the sum of £35 14s. had been written off the list of subscriptions and arrears as irrecoverable. The balance sheet showed the capital of the Institute at June 30th, 1899, to be £8,145 15s. 10d., but this did not include either the original value of the Wood Memorial Hall or the amount recently expended in its alteration. The following elections took place:—President, Mr. W. Armstrong; vice-presidents, Messrs. T. Forster Brown, J. L. Hedley, J. H. Merivale, U. W. Parrington, J. G. Weeks, and W. O. Wood. Council: Messrs. H. Aytoun, H. Armstrong, R. Donald Bain, G. Fred. Bell, T. E. Forster, T. E. Jobling, Philip Kirkup, A. C. Kayll, H. Lawrence, H. Louis, J. H. Merivale, H. Palmer, J. Morison, R. E. Ornsby, J. A. Ramsay, F. R. Simpson, J. Simpson, and C. Berkley.

Builders' Notes.

Shifnal Builders' Failure.—A meeting of the creditors of John Bradney, Harry Lloyd, and William Leppington, who carried on business as builders at Shifnal, Wolverhampton, and Albrighton, was held at the Wolverhampton Official Receiver's office on Tuesday last week. The statement of affairs showed liabilities amounting to £3,251 3s. 9d., and assets £2,305 6s. 4d., deficiency £945 17s. 5d. In his observations the Official Receiver stated that the bankrupts, Bradney and Lloyd, commenced business as builders as Bradney and Lloyd at Shifnal in March, 1893, with a joint capital of £500. Mr. Leppington joined them in 1897, putting in £355 of capital, which was borrowed, and was still owing. John Bradney had previously been in partnership in a similar business with Messrs. Skett and Butler as Bradney and Co., at Wolverhampton. The bankrupts' contracts pending include one at Llandrindod Wells, for £7,934; one at Wolverhampton, £1,590; one at Sutton Coldfield, £1,560; and one at Dawley, £350. They attributed their failure to want of capital, losses on contracts, and increase in the price of material and wages. —The debtors were adjudicated bankrupts, and Mr. H. P. Smith was appointed trustee.

Improved Construction of Astragals.—We have received particulars of a useful invention relating to an improved system of construction of astragals and means for securing glass in roofs of structures. Mr. George Francis Wright, glass roofing manufacturer, of 23, Paternoster Square, E.C., is the inventor and patentee. The astragals are made of metal, with one or more grooves or channels to serve for escape of water, and they can be made of any length and straight or curved, according to the desired shape of the roofing. These astragals are bored or drilled at intervals for pegs or screws, by which cover strips can be secured, the strips having longitudinal recesses and projections which not only allow the rain-water to flow down them but the edges to bear upon the glass roofing with or without packing strips which, when fitted, prevent beating rains from passing under them; as a rule, however, should any rain beat under the edges of the cover it will collect in the grooves or channels of the astragals and flow down to the eaves gutter or its equivalent. By this invention a roof of great strength can be erected, particularly if the astragals be braced by ties for distancing them, or be set on cross bearers, and in the case of any glass becoming broken, any section of the cover strips can be temporarily removed to facilitate the fitting in of fresh panes, no putty being necessary.

A Building Dispute at Halifax.—At the West Riding Summer Assizes last Wednesday, before Mr. Bosanquet, Q.C., an injunction was sought by Mr. J. Shoesmith, auctioneer and valuer, of Halifax, to restrain Messrs. T. S. Dodd and Co., Ltd., builders, of Halifax, from building on a plot of land between Rufford Road and Prince's Gate in that town. Mr. Scott Fox, for the plaintiff, said that in 1871 the plaintiff became the owner of two lots of an estate adjoining that concerned in the action. Two of the remaining lots were disposed of to another purchaser, while the rest were not sold until several years after. The conditions of sale were that villas or semi-detached villas should be erected on the estate, all of them in accordance with the building line, and the outbuildings, stables, and conveniences placed on the westerly side of the lot. The plaintiff built a villa at a cost of nearly £4,000, and after living in it about thirteen years leased it to Mr. Standeven. Mr. Standeven erected, with his permission, and without objection from anyone, a billiard-room and a greenhouse in front of the 60ft. building line mentioned in the conditions of sale. When the defendant company obtained possession of the adjoining land about a year ago they contended that the plaintiff had transgressed the conditions of the covenant under which the property was sold, and they had plans passed by the Corporation allowing them to erect houses right up to the plaintiff's residence, known as Stoneygate. The billiard-room was pulled down before the writ for an injunction was served. It was claimed that the putting up of such houses as the defendants proposed, to the extreme limit of the carriage road, would seriously depreciate the value of his property. The case was adjourned for further consideration in London.

Cardiff Builders' Affairs.—A meeting of the creditors of Messrs. Ivens and Anderson, builders, Cardiff, took place, on Wednesday last, at Cardiff, Mr. J. A. Orr (deputy official receiver) presiding. The gross liabilities are returned by debtors at £30,577, but they assert that the value of the assets is £3,281 in excess of their debts. The receiving order was made on the debtors' own petition in consequence of having a judgment obtained against them for £671. The debtors have informed the official receiver that they commenced business in February, 1890, with a capital of £350, which they contributed equally, and from time to time they have added to that amount, and they now state that they have altogether placed between £400 and £500 each into the business. They appear to have carried on building speculation extensively in various parts of the town. The whole of the properties, with the exception of six houses in Connaught Road, have been finished, and the majority are let. There are arrears of ground rent amounting to £475 14s. 1d., and rates amounting to £143 18s. due in respect of these properties. With respect to their failure, the bankrupts state that they would be able to pay all their creditors in full if the properties could be realised. They have kept no books of account showing their trading or financial position, beyond rent-books and wages book. They have no separate liabilities, and their separate assets consist of two bicycles, the furniture in each case being claimed by the respective wives. Mr. C. E. Dovey was appointed trustee with a committee of inspection.

Surveying and Sanitary Notes.

Rawdon Sewage Farm.—The Rawdon District Council have received a letter from the Local Government Board sanctioning the borrowing of £2,830 to pay off a mortgage on the sewage farm.

The tender of the Jarrah Timber and Wood Paving Corporation, of Broad Street House, London, E.C., has been accepted by the St. Pancras Vestry for the supply of hard wood paving for Hampstead Road.

Bierly Improvements.—Last Tuesday week a Local Government Board inquiry was held with reference to the application of the Council for sanction to borrow £551 for works of street improvement, and £225 for the provision of public lamps.

Oldbury Sewage Works.—Mr. H. H. Law, Local Government Board inspector, held an inquiry last Wednesday at Oldbury concerning an application made by the District Council to borrow £1,550 for works of sewage, and also £1,100 for the purchase of land for a refuse tip in connection with the outfall works.

Sewage Works and Disposal at Brotherton.—Mr. Ducat held an inquiry last Thursday into the application by the Pontefract District Council to the Local Government Board for permission to borrow £4,600 for works of sewage and sewage disposal at Brotherton. After the usual evidence, the inquiry closed and the inspector visited the site.

Street Improvements at Hull.—At the Hull Town Hall last week Mr. R. H. Bicknell, M.I.C.E., held an inquiry on behalf of the Local Government Board into the application made by the Hull Corporation for power to borrow £20,900, divided into £15,612 for the purpose of land, repayable in fifty years, and £5,288 for sewerage, paving, and flagging, and the substitution of hard wood in place of granite sets in Kingston Square and Jarratt Street.

Black Smoke Nuisance.—At the City of Manchester police court last Wednesday the following firms were summoned at the instance of the Manchester Corporation Sanitary Department for creating a nuisance by allowing black smoke to escape from the chimneys of their premises, viz.:—Phœbe Lomas, Plymouth Grove, fined 20s. and costs; Henry Briggs, trading as Henry Briggs and Co., Hood Street, 10s. and costs; Edwin Birchenall, trading as Birchenall, Wood, and Company, St. Mary's Road, 60s. and costs; and the London and North-Western Railway Company, Kirkmanshulme Lane, 40s. and costs, and an order of abatement was made against the same company in respect of their premises in Sheffield Street. Mr. Rook, sanitary department, prosecuted in all the cases.

Property and Land Sales.

TO CAPITALISTS, INVESTORS, SPECULATIVE BUILDERS, AND OTHERS.

A unique opportunity presents itself for the acquisition and development for BUILDING purposes of a magnificent and highly valuable FREEHOLD ESTATE in the north-west of England. The property extends to a very considerable area, is heavily timbered, and possesses several miles of most important main road frontages. It is within easy reach of a well known port and town, and thus conveniently situated for the conveyance of the plant necessary for building.

The estate thus offered is extremely well adapted for the ERECTION of very high class residences, commanding good rentals, and would undoubtedly prove a sound investment.

Plan, views, and all particulars, may be obtained by bonâ fide applicants only from GILLOW and Co., 406, Oxford-street, W. 1

FREEHOLD BUILDING ESTATE, fronting on main road and close to golf links and Highgate Woods, seven minutes' walk from Muswell Hill and East Finchley stations. To be LET on lease or SOLD in plots. Liberal advances to responsible builders if required. For plans and particulars, apply to Mr. GEORGE H. PAINE, Architect and Surveyor, 6, Stoke Newington-road, N. 10

SALE DAYS for the Year 1899.

Messrs.

FAREBROTHER, ELLIS, EGERTON, BREACH, GALSWORTHY, and CO. beg to announce that the undermentioned dates have been fixed for their AUCTIONS of FREEHOLD, Copyhold, and Leasehold ESTATES, Reversions, Shares, Life Interests, &c., at the AUCTION MART, Tokenhouse-yard, E.C.

Other appointments for intermediate Sales will also be arranged.

Thursday, Sept. 21
Thursday, Oct. 12
Thursday, Oct. 26
Thursday, Nov. 16
Thursday, Nov. 23
Thursday, Dec. 7
Thursday, Dec. 14

Messrs. FAREBROTHER, ELLIS, and CO. publish in the advertisement columns of "The Times," "Standard," and "Morning Post," every Saturday a list of their forthcoming Sales by Auction. They also issue on the first of every month a schedule of properties to be let or sold, comprising landed and residential estates, farms, freehold and leasehold houses, City offices and warehouses, ground-rents, and investments generally, which will be forwarded free of charge on application.—No. 29, Fleet-street, Temple Bar, and 18, Old Broad-street, E.C.

MOTE PARK, MAIDSTONE.

MESSRS. SEYMOUR and WARING (in conjunction with Messrs. R. WATERMAN and SONS) are favoured with instructions from the Council of the Royal Agricultural Society of England to SELL by AUCTION, on AUGUST 21st and 22nd, 1899, the whole of the SHOW YARD ERECTIONS used at the Royal Agricultural Show, exceeding 1,000,000ft. of Timber, 10,000 Railway Sleepers, 400 Buck Gates, Quantity Iron Tanks, and other effects. Sale to commence at 11 a.m. precisely each day.

Catalogues may be obtained of Messrs. SEYMOUR and WARING, Auctioneers, 46, Earl-street, Maidstone; Messrs. R. WATERMAN and SONS, Auctioneers, No. 20, Week-street, Maidstone; and of Mr. R. S. BURGESS, Show Yard, Mote Park, Maidstone.

WIMBLEDON HOUSE ESTATE COMPANY, LIMITED.

The Directors are prepared to receive PROPOSALS for the SALE or LETTING of SITES for Private Houses on this property, which is being developed by the Company as a high-class Residential Estate.

The land lies high with a deep gravel subsoil, and has a frontage of over half a mile to Wimbledon Common, and is well timbered.

The Estate, which until lately was the residence of the late Sir Henry Peek, is situated in the best part of this much sought after suburb, and commands extensive views over the Common to the Surrey Hills, and the excellent service of trains makes it peculiarly convenient to gentlemen whose pursuits command their presence in London.

Plans and further particulars may be had by applying to the SECRETARY, at the Estate Office, Parkside, Wimbledon, or to the Surveyor, GEORGE HUBBARD, F.R.I.B.A., 85, Gresham-street, E.C.

WEYBRIDGE, within few minutes of station, overlooking river, beautifully situated. FREEHOLD PLOTS, suitable for good residences, will be offered by AUCTION, on the ESTATE on THURSDAY, 17th AUGUST, at TWO p.m. Free deeds, instalments (if desired).

For particulars, plans, and tickets, apply to THE NATIONAL LAND CORPORATION, Limited, No. 18, Adam-street, Adelphi, W.C.; or to the AUCTIONEER, F. G. WHEATLEY, 263, Strand, W.C.

Seaford, Sussex.
(Between Eastbourne and Newhaven.)

Exceedingly choice Building Sites, overlooking the sea and golf links, on the most favourable and easy terms of payment, in one of the healthiest and most delightful towns on the South Coast.

MAPLE and COMPANY have received instructions to SELL by AUCTION, at the Bay Hotel, Seaford, on THURSDAY, AUGUST 17th, 1899, at TWO o'clock precisely, the THIRD PORTION of the SUTTON ESTATE, comprising about 100 exceedingly desirable Plots of FREEHOLD BUILDING LAND, suitable for the erection of houses at a cost of from £600 to £800, fronting the Eastbourne and Southdowne roads and Sutton-avenue, and commanding sea views; overlooking the Seaford Golf Links and about five minutes from the railway station and esplanade. Terms of payment, ten per cent. deposit, balance in nine half-yearly instalments, with interest at four per cent. and free conveyance.

Particulars, with plans, of the Auctioneers, 126, North-street, Brighton.

IMPORTANT BUILDING SITES.—Upper Sydenham, Kirkdale, and Peak Hill, 5½ acres, roads on three sides, suitable for shops and private houses. Five minutes from Sydenham Station, L.B. and S.C. Railway. Also 97, Perry-hill, Catford, two roads. Other BUILDING LAND TO BE LET at Forest Hill and Barnet, leases eighty years, direct from freeholders.

Offers may be sent to Mr. H. PORTER, Surveyor, 16, Russell-square, W.C., or to the undersigned, W. ARNOLD HEPBURN, Clerk to the Leathersellers' Company, Leathersellers' Hall, St. Helen's-place, E.C.

HARROW RECREATION GROUND.—FOR SALE, by Private Treaty, the valuable FREEHOLD FRONTAGE of the above for Building Purposes, comprising about 680ft., varying from 150ft. to 125ft. in depth. Within a few minutes' walk of three lines of railways. Faces the main road from Harrow to Pinner, which is made up in every way and taken over by the local authorities, the rear overlooking the recreation ground of 26 acres.—Apply to Messrs. W. B. WALKER, High-street; A. L. LLOYD, Headstone-road; or F. W. STEVENS, High-street, Harrow.

FOR SALE, by Private Treaty, a magnificent FREEHOLD Park-like BUILDING ESTATE of about 10 acres, interspersed with noble trees, within 4 miles of Hyde Park, having a frontage of 900ft. to one of the finest roads in the metropolis; there is also a commodious and well-built modern mansion; this unique property is suitable for a college, institution, or an annexe to a wealthy club; it is, moreover, fully ripe for the erection of good residences or flats, for which there is a great and increasing demand; sub-soil gravel.—For Plans and particulars apply by letter to "FREEHOLDER," care of COLMAN and Co., Glanville House, Arundel-street, Strand.

ANSELL and MALLOWS, Architectural Draughtsmen and Quantity Surveyors, 21, Buckingham-street, Strand, W.C.

R.I.B.A. EXAMS. PREPARATION, personally or by correspondence, in three, six, nine, or twelve months' courses. Architectural Lending Library. Special three months' finishing courses.—For full particulars apply to Messrs. HOWGATE and BOND, Associates R.I.B.A., Perchard House, 70, Gower-street, W.C. (close to the British Museum.

ARCHITECTURAL Institute, Society of Architects, and Civil Service Technical Examinations. Preparation by correspondence, personally, or in residence. Seventeen first places.—MIDDLETON and CARDEN, 19, Craven-st., W.C. 1

PLANS, Applications, &c., Prepared by an experienced Architect. Advice given in Building Act questions, and disputes settled.—Address, "Architect," 17, Algarve Road, Earlsfield, S.W. 3

APPOINTMENTS VACANT.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

ARCHITECT'S ASSISTANT (competent) WANTED.—Write, stating age, experience, and salary expected, to CARTER and ASHWORTH, Architects, 86, Eden Street, Kingston-on-Thames. 1

JUNIOR ASSISTANT WANTED in an Architect and Surveyor's Office, N.W. Neat draughtsman and printer; good handwriting indispensable; permanency to good man.—State age, experience, and salary required to "F. S. I.," 119, Brondesbury-road, Kilburn, London.

BUILDER'S ESTATE CLERK Wanted. Must be good at book-keeping and prime costs, and used to selling house property.—Address, stating age, salary required, with references to "T. B. G.," 23, High-street, East Ham.

ASSISTANT.—WANTED at once, competent ARCHITECTURAL ASSISTANT; must be well up to domestic and general public buildings, and with thorough knowledge of detail work. Fifteen miles from London.—Send references, with age and lowest salary, to "Engineer," care of Wm. Dawson and Sons, 23, Northumberland-avenue, W.C.

APPOINTMENTS WANTED.

Reversible Cutter, with "Drove" Edge out.

J. G. FAULDS'

IMPROVED

Multiplex Stone-Cutter.

Any person manufacturing these Tools will be liable to prosecution for infringement of Patent.

THESE IMPROVED TOOLS for stone-dressing combine lightness with great efficiency in working, with perfect freedom from the annoyance of bad sharpening, tempering, or other defects. They possess *double* the advantages of the AMERICAN TOOTHED TOOL, by having, in a handy and convenient form, double teeth, or a chisel and "tooling drove" combined, the efficiency and economy of which a PRACTICAL MAN WILL SETTLE IN A FEW MINUTES.

The outstanding merits of the MULTIPLEX STONE-CUTTER are its simplicity and economy. They are simple in construction. The Handles are made with a slot (see below) in which the Cutter is inserted, and the Tool is complete. There are no screws or joints in the Handle to give trouble in fixing or removing the Cutter. They are economical. By the use of these Tools a great saving is effected, all the loss of time, trouble, and expense incurred in getting the ordinary tools sharpened being avoided.

Owing to the handiness and durability of these Tools they are in constant use throughout the whole of the United Kingdom.

Two sample Tools, with six Cutters, sent carriage free to any address in the Kingdom on receipt of a Postal Order for 2s. to the

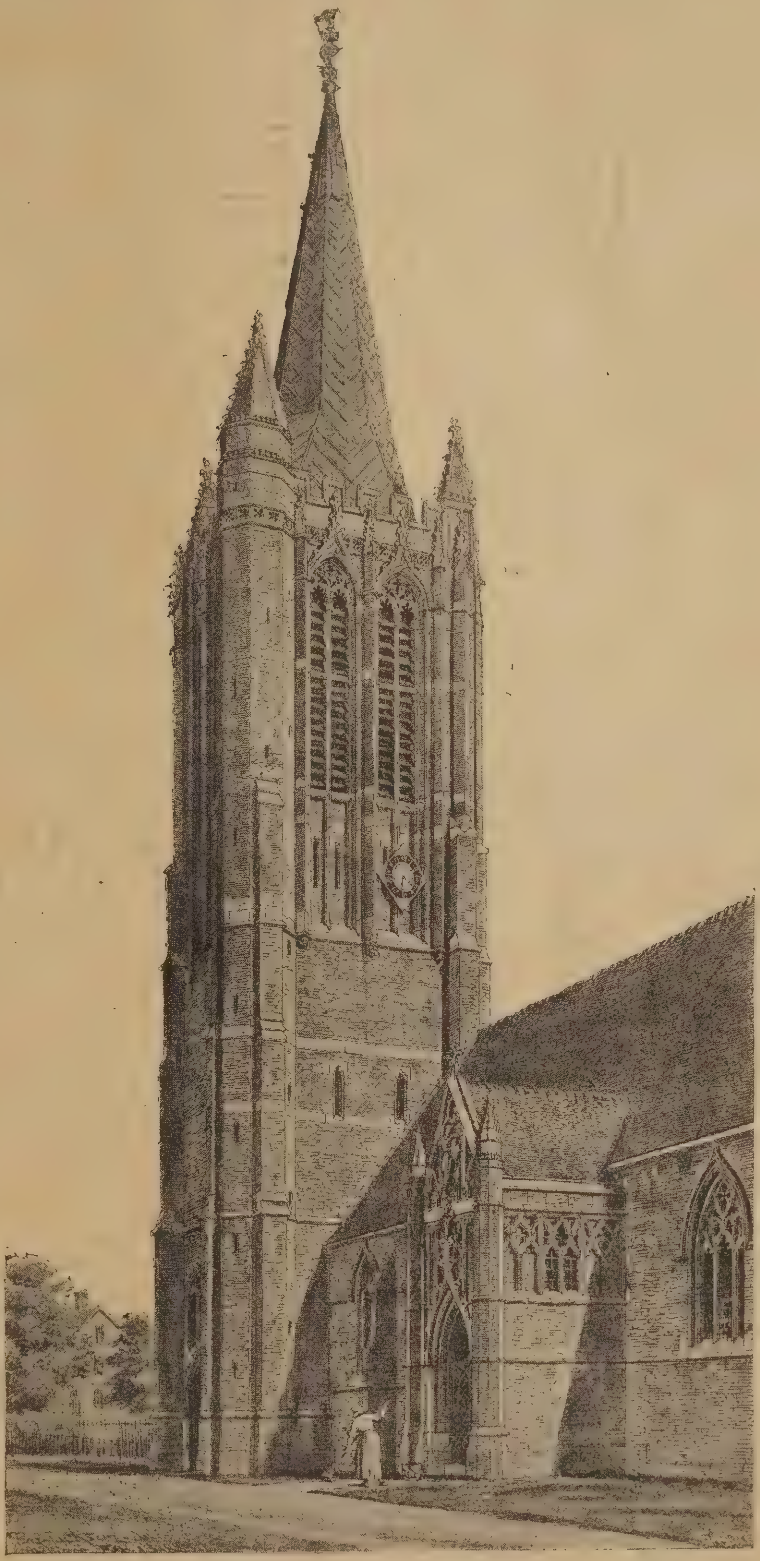
An Architectural Causerie.

A New Use for Town-House Roofs. A most interesting set of experiments has been brought to a successful issue at Paris, and may possibly prove suggestive to British architects and house-owners. It is no less than an attempt to realise the delights of the famous hanging gardens of Babylon. Of course, in most Oriental countries, where the roofs are flat, more or less serious efforts at floral cultivation are attempted on those not very elevated crowns of buildings. This is partly to afford distraction to the ladies, and partly to act as an additional screen. Well, the idea occurred to a certain M. Tabary, who owns large houses in the Rue des Valois and the Avenue Suffren, Paris, that the roofs of his tall and crowded edifices could be turned into rivals of the Luxembourg and Tuilerie gardens, and far more convenient, as instead of a long trudge by dusty, noisy streets, a mere going up aloft by means of passenger lifts would bring the tenants to bosky groves and glowing floral borders. It must be said that modest gardens amidst the chimney pots are not new things for Parisians; the citizens of gay Lutetia have ever been prone to dispute the region of tiles and smoke stacks with the reprobate grimalkin and impudent sparrow. But now, as in pre-revolutionary days, the efforts are generally restricted to a few flower boxes and pots, arranged close to parapets, and clustered round diminutive arbours. M. Tabary's venture differs from others mainly owing to its magnitude and thoroughness. On the top of his many storied houses he has veritable gardens, with not only beds of flowers, but small groves of flowering shrubs, fruit trees, vines, &c., fountains and big arbours. Some of the trees are over 12ft. high.

Let us consider the Rue des Valois example. Here we find that the available space amounts to little more than 600 square feet. The roof has been levelled, the foundation, as it were, consisting of iron girders, closely interlaced; over this is a layer of cement, then a layer of fine sand, upon which are placed large sheets of absorbent mill-board, heavily impregnated with creosote and other preservative and waterproofing substances. On this is another layer of sand, 4in. deep; now comes the rich garden mould, which is 2ft. deep. Of course the weight of all this is considerable, but then Paris tenement houses of the better class are most substantially built, having deep foundations, and thick walls, both outside and partition. The Tabary gardens in the Avenue Suffren are a still more formidable undertaking, as they extend over three big houses. The parapets are somewhat high, and the drainage is managed by giving the gardens a slight incline outwards, all water finding its way to the gutters and water-pipes covered with gratings. The gardens are laid out in most approved style with flower beds, gravelled paths, sparkling fountain, and trellised arbours. Not only are there fine magnolias in full bloom, but peach trees bearing fruit, and flourishing vines, promising abundant crops. In both the instances dealt with the houses are tall and on excellent sites, so that splendid panoramic views can be enjoyed by the happy tenants, who, moreover, are brought up to the central arbours in passenger lifts.

Whether such extensive gardening operations so high up in the air are possible, advisable, or needful, in London and our other crowded cities is a question open to discussion. No doubt few of our modern bee-hive mansions, or "flats," could bear such an experiment, though a roof terrace, with floral boxes, is certainly easy of attainment, both for the highly rented mansions and the popular barracks, which are known, for some unexplained reason, as "model dwellings." One thing is quite certain, during the recent heat wave which prostrated the metropolis such roof gardens would have been a boon, and would have brought blessings on the heads of the architects who had placed such retreats within the reach of the scorched, gasping Londoners.

G. C. R.



DESIGN FOR TOWER TO ST. JOHN'S CHURCH, WIMBLEDON. T. G. JACKSON, R.A., ARCHITECT

St. John's Church, Wimbledon. The above illustration is from a design made some years ago for a tower to St. John's Church, which Mr. T. G. Jackson, R.A., erected at Wimbledon. The tower has never been carried out for want of funds.

The Architect's Note Book.

EVERY business man is fully alive to the value of a properly kept and regularly entered diary, containing exact details of all the occurrences of his business life, the time occupied upon each detail, and the out-of-pocket expenses incurred. But the architect in general practice needs something more than this. As with the doctor, so with him, much of that of which most accurate record is necessary occurs outside the four walls of his office, and must be noted at once if it is to be remembered and acted upon with certainty; while, if he be a man of method, his diary will be entered up but once each day, just before leaving office. A pocket note book thus becomes an essential, and if the habit of carrying one be once adopted, it is found available for a multiplicity of uses, and the further useful habit of consulting it when diarising will often lead to matters being attended to which otherwise might, in the multiplicity of affairs, have been overlooked. Its usefulness will generally, however, be apparent much earlier in the day than this. When the letters are opened in the morning, and the plan of work for the day is decided, the note book is handy for entries of appointments, times of trains, and of works to be visited, and under each of these heads further entries will serve as reminders of the various points to be discussed at interviews, nearest routes for journeys, and details needing adjustment or consideration on the various buildings in progress. Then during an interview, or on the work itself, notes can frequently be made which are of the highest value—answers to doubts or queries for solution when the office is reached again. Notes of this sort, too, are not only useful in the assistance they afford to the successful "running of an office," but have a high legal value also in the quite possible event of the note taker having to give evidence on oath; and, having this in view, it is well that the notes should be made in some more permanent medium than lead pencil. Liquid ink is generally out of the question, but a blue copying-ink pencil will serve the purpose admirably, and can easily be carried, with other pencils, scales, and rule, in the rule-pocket which many architects wear inside their coats.

The habit of carrying and using such a note-book is not one which can be adopted and laid down at will. Granted its expediency, it needs to be cultivated, and should never be abandoned; and a great aid to its early adoption is found in its value to the youthful pupil or assistant as much as to the active practitioner, particularly when sent away from the office with messages or upon inspections. Its importance is recognised in the demand, upon the part of the R.I.B.A. Examination Committee, for the production of evidence of the actual inspection and supervision of works in progress by candidates for the Final Examination for Associateship, such evidence being exceedingly difficult to compile and produce if a regular system of note-taking has been adopted. Some few short-sighted principals have been known to discourage the keeping of such notes by their pupils; but discouragement of this sort is fortunately confined to the few who are still possessed of the old idea that a pupil ought not to be allowed to know too much—ought not, in fact, to be allowed to pick up knowledge which he has paid a premium to be taught. An enlightened man uses a note-book himself, and acknowledges the value, both to himself and them, of similar books being regularly kept, always accessible and in the pockets of all in his employ.

G. A. T. M.

On Reflection.

The Vandyck Celebration.

DURING the past few days the hub of the artistic universe has been at Antwerp. Three hundred years ago Antony Vandyck was born within its precincts, and in paying honour to his memory Antwerp has been honouring itself, and exhibiting to the world a striking example of that combination of artistic and civic enthusiasm to which its burgomaster referred with justifiable pride at the opening of the tercentenary celebration. For Englishmen this celebration has an interest only second to that which it has for the Flemings themselves. For not only have a large number of the pictures now being exhibited at Antwerp been culled from English collections, but it may fairly be claimed that the great portrait painter was himself half an Englishman. As court painter to Charles I. he lived for many years in this country, he married an English wife and was buried on English soil. Then, again, while we share with all the world the purely artistic interest which attaches to Vandyck's pictures, they have for us a peculiar attractiveness by reason of their association with one of the most interesting and turbulent periods of English history. It would be an interesting inquiry for the student of history how far the glamour of romantic interest which has surrounded the House of Stuart is due to the fact that the charming and graceful characteristics of the members of that house and their aristocratic supporters have been perpetuated in Vandyck's wonderful gallery of portraits. However that may be, there can be no doubt about the supreme place which Vandyck holds amongst the portrait painters of the world, and it is therefore satisfactory to know that as the Rembrandt Exhibition at Amsterdam last year was followed by a winter exhibition of Rembrandt's works at the Royal Academy, so we are to have next winter a Royal Academy Exhibition specially devoted to the works of Vandyck.

A Word about Pageants.

ONE feature of the Vandyck celebrations must have afforded matter for astonishment to most English people who witnessed it or read about it. Four times during the period of the celebrations there passed through the streets of Antwerp a "cortège artistique," so elaborate, interesting and beautiful as to call forth expressions of practically unanimous admiration from those who saw it. It represented with wonderful completeness the most notable art epochs of the world from the Egyptian and Assyrian down to the age of Vandyck. On its preparation the municipality of Antwerp spent £4,000, and eminent artists and craftsmen devoted many months of ungrudging labour to the perfecting of its details. Such a thing would seem to be an impossibility in this country. We have not the genius for outdoor pageantry; we are too literal, too unimaginative, too undramatic. Our street processions are occasionally impressive, more often simply grotesque, but never by any chance artistic. Even the great Jubilee procession of 1897 was a failure from a pictorial point of view, and as for the annual effort of the Corporation of the City of London on November 9th, that is a spectacle that might well move the artistic soul to tears, were it not so utterly ludicrous. It is true that there has been seen within the past few months an artistic experiment which suggests that even in this country a street procession, which should be neither offensive nor ludicrous, might be carried out if only the right people could be engaged in its preparation. The recent revival of the masque by the Art Workers' Guild, revealed the existence of latent possibilities in this direction that had not, perhaps, hitherto been suspected. If the Art Workers, having successfully revived the old English masque, are sighing for more worlds to conquer, we would suggest that they should devote their energies to the preparation of an outdoor pageant which, in celebration of some worthy occasion, should afford many thousands of Londoners the same kind of artistic enjoyment and stimulus as a select few gathered in the Guildhall derived from that beautiful stage picture, the Procession of Fair Cities. We are a prosaic and a practical people, and we do not want our omnibuses and cabs to be often displaced by dolphins, cupids, and symbolical cars; but if it should happen that with the growth of intelligence and artistic sensibility the Lord Mayor's Show should die of ridicule, it would not be a bad thing if its place might be filled by an annual pageant (say on St. George's day) in which poets and musicians, art workers and craftsmen, might join hands to attain a worthy artistic object such as has just been achieved in Antwerp.

Spoiling the Royal Exchange Frescoes.

FRESCOES and advertisements jumbled together do not, as a rule, look very artistic. On the inner walls of the Royal Exchange they certainly look very much out of place. The advertisements are much more numerous than the paintings, and the Royal Exchange bids fair to become a mere advertisers' exhibition. Fortunately the feeling in the City is against the growth of advertisements, and the Gresham Committee state that no others are to be admitted, and whenever presentations of paintings are made the panel required will always be cleared of the offending advertisements. That is some consolation, but it does not do away with the present incongruity of gilded advertisement letters hanging on the same walls with beautiful works of art. Such paintings as Mr. J. Seymour Lucas's "William the Conqueror granting a charter to the Citizens of London," the picture of King Charles I. demanding the five members at the Guildhall, and the picture of Queen Elizabeth on her white palfrey, cannot be seen to advantage in proximity with coloured posters of ships in mid-ocean, insurance companies' advertisements, and the like.

"A Labour of Love."

AGHADA is in Ireland; and it must be a very charming spot, both by reason of the natural beauty of its surroundings and the Arcadian simplicity of its inhabitants. The Presbyterians of the town (or is it a village?) have just built themselves a new iron church. The correspondent of the "Belfast News Letter," which records the important event, waxes eloquent over the beauty of its situation: "It overlooks the harbour, and the music of the waters steals in through the open windows. Close at hand are the woods of Rostellan, and away in the distance undulating hills and sunny inlets blend in perfect harmony." And when he comes to describe the building itself our scribe's enthusiasm is unabated, though his language is more prosaic—and less grammatical: "There is (*sic*) a convenient vestry, a platform, a reading desk, a stove, and comfortable seats for the worshippers, all finished in a style which shows that with the contractors it was a labour of love." There is something delightfully primitive in this expenditure of enthusiasm on a corrugated iron conventicle and its simple furniture. In some such terms, one may suppose, the natives of Fiji or Tahiti might have expressed their admiration for the first rude chapel erected in their midst by pioneer missionaries. Happy Aghada, where all the geese are swans, and the contractors work for love.

DINING HALL, TRINITY COLLEGE, DUBLIN.

THIS is a very interesting old building of the last century, built from the design of a German named Richard Cassels, who settled in Ireland, and who is also responsible for several buildings of a similar type and style both in and around Dublin.

It may be of interest to mention that, on the site of the present hall, there previously existed a building which was designed as a dining-hall, but owing to the foundations having sagged to a dangerous extent, it was pulled down in 1755, very soon after its erection. This first building was carried out under the superintendence of the college bricklayer, whose name is peculiarly appropriate to his calling. He was a Mr. Plumber.

After the demolition Cassel's advice was sought by the college authorities, and the present building was erected from his plans. It is stated in the college books that although he died before its completion, his design was carefully carried out.

The building stands detached in a fine open square, presenting a front nearly 80ft. wide, facing south. Its detail is peculiar in character; the mouldings generally of the stonework are bold and heavy, the angular pediment is supported by four Ionic pilasters of granite peculiarly built up in courses, the caps and bases are of Portland stone. The main entrance is reached by a flight of ten steps, rising to a height of five feet above the ground level. The dining-hall proper is approached through a spacious ante-hall or vestibule. It is a fine, well-proportioned room, measuring 84ft. long, 35ft. in width, and 35ft. high; it is panelled in oak to a height of 12ft. round the four walls, with a plain but effective capping cornice.

The hall is abundantly lighted by four windows on the east side over the panelling, and in the north end is a well designed Venetian window; in the centre of the west wall is a very interesting fireplace in stone with an overmantel in oak richly carved. There is a well arranged flight of stone stairs leading to the Fellows Club or common room over the ante-hall, and some good examples of bent iron work are here to be found; an example is given in the illustration on this page. A series of very fine full-length portraits of some of the many distinguished graduates of the University, including Chief Justice Downes, Lord Avanmore, Gratton, Flood, and Prince Frederick, father of George III., occupy all the available wall space of the dining-hall. The ceiling is covered 10ft. all round the plaster work, and the wood work, as well as the detail generally of the interior, is very pleasing and effective. The building as now existing was commenced about 1758 and finished in 1761.

DUBLIN FOR THE ARCHITECTURAL STUDENT.

AN ADDRESS TO STUDENTS.

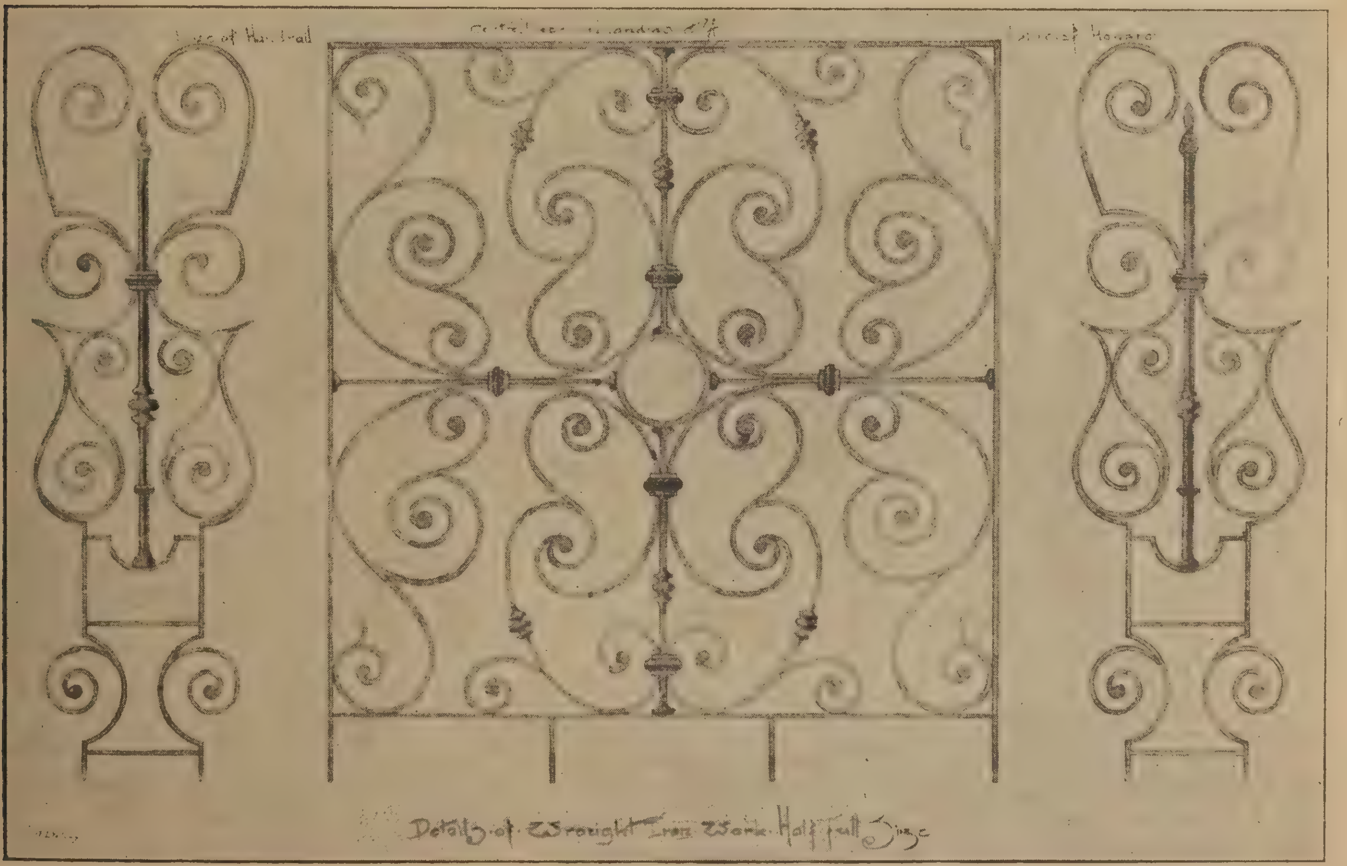
By THOMAS DREW, F.R.I.B.A., Pres., R.I.A.I.

ENOUGH has been said—and more than enough—of the disabilities and grievances of those whose architectural lot is cast in this somewhat isolated old provincial capital. There is a great deal to be said on the other side. Is it nothing to live in a pleasant city with a good climate and a beautiful country environing it, in a city of 350,000 people, too large to be provincial in a vulgar sense, not too large to be sociable; abounding in companionship of many who are following literary, scientific, artistic, musical or antiquarian pursuits; with sympathetic welcome for every man whose tastes may draw him into congenial bye-paths? Has it not fine libraries and museums, and some specially unique ones, ancient records, MSS., &c., &c., all lying open and free to all comers, and for the most part on Sundays as on week-days? To mould and shape the wild, untutored architect-man through a liberal education, and to inspire intellectual instincts in him, there is no influence wanting. That is something.

And when it comes to architecture proper, and comparison is to be made with some other cities of the Empire, is Dublin despicable? For the architect, is there not something in the luxury of living in an old historic city, having many dignified and respectable monuments—a local metropolitan city of past times with much picturesqueness of architectural effects, spontaneous, unstudied, of unconscious evolution, as it could not be in any brand new city? Think of Birmingham, Leeds, Bradford, Wolverhampton, even Manchester or our northern Irish manufacturing City of Belfast; would they be as good as this? What is there in such cities to inspire an architectural student with one spark of enthusiasm as he comes and goes in their streets?

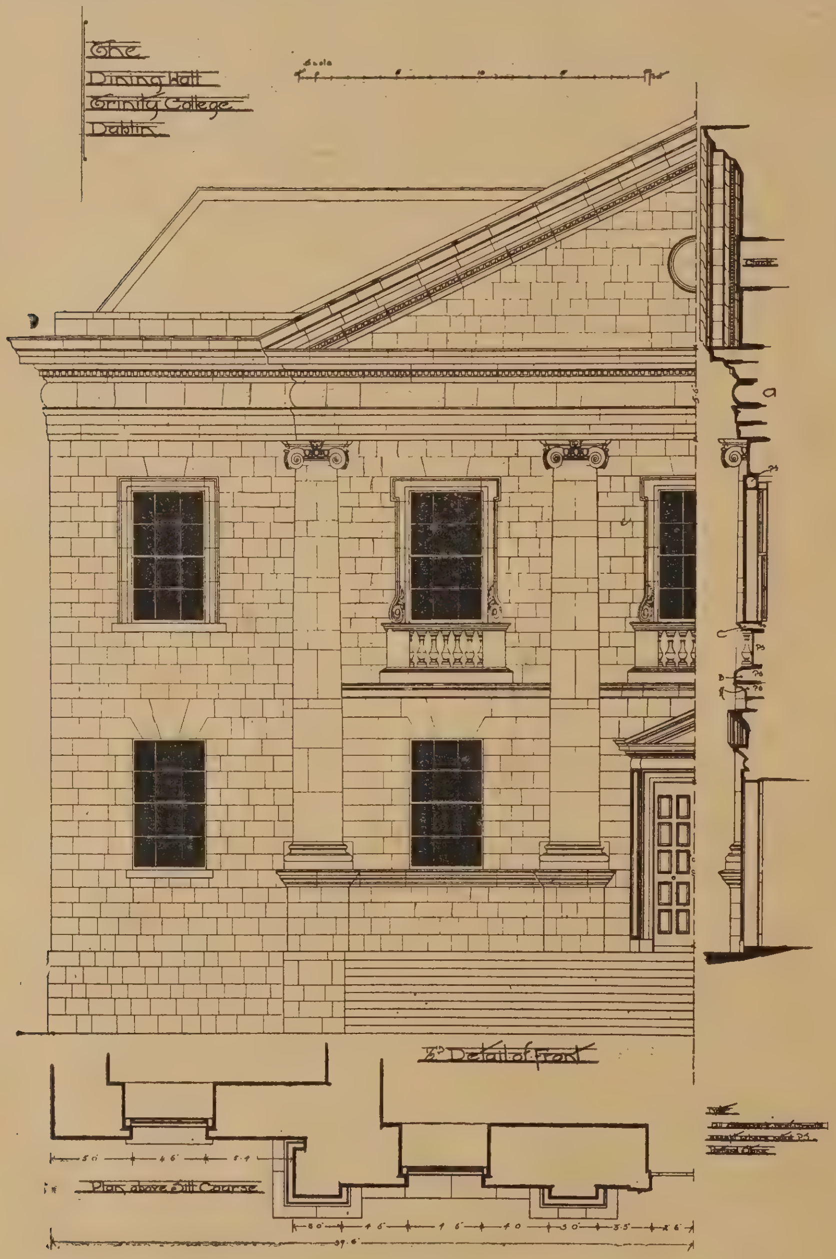
London has, of course, its amazing wealth of noble and illustrative old architecture, from its Abbey of Westminster through all the gamut of styles of the Middle Ages up to the grand chord of the Renaissance in St. Paul's Cathedral; but it is greatly scattered. It is hard to be found out by the student in his limited leisure. He does not, as a matter of fact, seek it out. It is all overflowed by a teeming modernism and the sordid flood of building of a new old city.

Edinburgh has its charms, and they are not in the category of those of any other city of this old land. It has its wonderful beauty of picturesque, almost theatrically-imagined groupings of mountain and architecture and aerial enchantment, though one may think at times of a vision of Durham valley to compare with it, seen once under a supernatural effect of heavenly beauty. If there be not romance, history, and pictorial charm in the architectural grouping of Edinburgh to inspire a student as he passes through Prince's Street to his day's round of mornings, and returns in its sunset effects of evenings, there is no spirit within him. Its architecture, however, taken soberly in items, is of moderate interest and



IRONWORK IN DINING HALL, TRINITY COLLEGE, DUBLIN. DRAWN BY J. F. DELANY.

value. Clear cut out against the sky, on the Calton Hill, is a fragmentary reproduction of ancient Greek architecture—a fine thing but exotic on Scottish soil. Looking another way is a finer monument—the towering pile of Edinburgh's ancient fortress. It has an ancient cathedral, interesting and somewhat characteristic of Scottish peculiarity, but not a great or grand church. It has a modern cathedral, too, of nice and respectable architecture, but of limited interest. The Scott monument is a beautiful and happily placed composition notwithstanding its barbarous detail, and the untutored genius of its architect, putting to shame many professors of cultured and academic design. So, one might go through the monuments of Edinburgh, taken as educational examples for an Art student, without finding any which are great. What it has is, however, piled together to make an incomparable Edinburgh, an architectural dream for the architectural scene painter and poet.



DINING HALL, TRINITY COLLEGE, DUBLIN. DRAWN BY J. F. DELANY.

Give me *Dublin* in fair comparison with other cities of our three Kingdoms, as a satisfying home for a student of architecture if he will only open his eyes. It has in a small circle of streets good architecture, ancient architecture, highly illustrative of architectural styles. It affords groupings of architecture unworked and unpainted, which might make the fortune of an architectural artist.

As to architectural study, I do not believe in a chronological system, that is, beginning at the beginning—say, starting with the bee-hive hut and working the way through the centuries up to Fountains or Canterbury.

Our unequalled English language is as glorious a heritage as our English architecture, and affords an analogy. Who studies English literature according to such pedantic method? We begin with the study of correct vernacular English. If the student is a philologist, he travels backward into the delightful eighteenth century English of Addison, Steele, Johnston, or our own dear old Oliver Goldsmith—farther back through Milton to the glorious literature of the Elizabethan era and the English classic Renaissance—Spencer and Shakespear; further back to Chaucer, representative of English middle ages—further, as the philologist pursues his study, it is even backward through the language of the Norman, Saxon and Celt, Roman, Greek, Hebrew, Sanscrit, to the origin of speech.

The Dublin student may profitably begin his course with latest Dublin architecture, *i.e.* Dublin vernacular, which is to be found in such thoroughfares as Dame Street, and College Green. There are not wanting respectable, and even bold and striking specimens of the modern architect in various moods. Criticism stands silent, for the designers of most of these modern notable buildings are yet with us. It may be said that there is to be studied a good deal of refinement of design. It is at least for the student to exercise criticism as to what is congruous, what incongruous, what to imitate, what to avoid. All study, however, should be in generous and Catholic spirit. It is a characteristic evil habit of smart Dublin people to be Heaven-born critics of architecture as of other arts which they are particularly ignorant of; among professional architects carping criticism is a hateful thing.

After the vernacular or up-to-date buildings of Dublin, the student falls back on the main architectural wealth of the city which distinguishes it, and sets its stamp on it all over—its Classic architecture of the eighteenth century. There is no example that is absolutely uninteresting, and it has a characteristic of its own in abounding beautiful decorative details imported into it by the colonies of Italians and fugitive Huguenots who made Dublin their home in the last century. There is much variety of genius evinced in the works of different architects. These qualities give an interest in the lives and personalities and histories of the buildings of these past masters. To one who has made a study of them for thirty years they become instinct with life. For myself, I could nearly persuade myself that I knew Francis Johnston, architect, as a boy, and had a pinch of snuff from him. Mr. Gandon, the gay and well-mannered French gentleman, I seem to have known. Mr. Cooley I am not well acquainted with; but as for Dean Swift, who cast his keen epigrams and gibes about every public building of his time in Dublin, he is a familar everywhere. I can believe I have met him one day in Ship Street, Dublin, going by way of the castle steps to the Rose Tavern in Castle Street to sup with his knot of the Friendly Brothers of St. Patrick. Arrived at Castle Street, with a side glance he takes in that something is being done at the rival cathedral, relieves himself by an unprovised gibe at his archbishop:—

> Cursed Cobbe from Christchurch the Cross has pulled down,
> And planted what still he more worships—the Crown.

As he turns in the opposite direction where a new gateway has been added to the upper castle-yard it is but to observe that it is surmounted with a petty statue of Justice, which serves to point another gibe at ruling powers. "Her face to the Castle, her back to the people." Many of such yet-remembered epigrams hang about the buildings of Dublin, more specimens of which I may recall hereafter.

Yet another characteristic in which Dublin "has the pull," so to speak, over the new British town of commerce is the presence of picturesque and pictorial capabilities. About its streets and in its cathedrals are bits of pictorial surprises; architectural forms to which time has imparted a happy and softening glamour of colour. They wait for the architect artist when he will break away from the monotony of his squares and drawing-board. Some have asked impatiently where is this beauty to be seen, for instance, and the answer is—everywhere, if you have not been Heaven-afflicted with colour blindness at your birth. Cultivate the faculty of realising beauty by the wayside. Think of what an architect like Ernest George could make of pictorial Dublin. Some have had the privilege, some years ago, of seeing a collection of his drawings at a local exhibition. Study what such an artist would make of a commonplace London thoroughfare—say, familiar Bow Steeple—familiar objects, common cabs, and commonplace shops, when the over-familiarised eye would see nothing in passing by to admire. Mark how the artistic intelligence takes it in, with a delightful play of colour and form and sky, warm reds, and pleasant-toned greys.

There is one piece of advice that may be interpolated here. Never study Irish street subjects anywhere in wet or gloomy weather. Local colour in all Irish towns, and light and shadow—which can be as lovely there at times as anywhere in the world—are only paintable when skies are bright, and roofs and stone and bricks and streetway foregrounds are dry.

And if it be asked by some of the sightless ones where they can be directed to a subject, I would say, for one: Pass the short distance from one cathedral to another as you leave Christ Church by Nicholas Street, and, as you cross the line of the old city wall at Back Lane, take in the picture that squalid, patristic street makes, with Minot's great steeple towering in a sunny haze in the centre, and the pent-house roofs of the middle distance, and the foreground street strewn with parti-coloured wares, vegetables, old clothes, and fish and meat—a busy, lively scene of squalid Dublin life, but a picture subject. Or look about the cathedrals where a water-colour artist may find a score of subjects, always premising that he has bright light; or take even the upper castle yard; not much architecture there, but quaint and Dutch-like, and lovely in local colour when the sun shines bright on its north side. Everyone of us cannot go to Rome, or Vicenza, or Venice, but we might find such subjects as they furnish under like sunny effects of skies in several groupings of our Dublin City Hall, the Houses of Lords and Commons porticoes, and about the precincts of Trinity College.

There may now be said something of the names and personalities of the eighteenth century architects of the English Renaissance, who set their mark on Dublin in an era of passing prosperity and metropolitan existence, under the art patronage of a local aristocracy, with a native parliament. I regret that few of them were of native extraction. One of the earliest who set his vigorous impress on a characteristic Dublin was "made in Germany."

Richard Castles, Cassel, Castle, or Castel, was invited to this country by Sir Gustavus Hume, of the County of Fermanagh, says the record. He was a good specimen of a trained Palladian architect, and must have had some genius for construction, for he constructed the Newry Canal and built the first stone lock in Ireland; but, *teste meo*, carpentry was not his *forte*. The great round room of the Rotunda buildings was among his achievements, and I can say that the original carpentry of that roof, over a circle 80ft. in diameter, is one of the most imbecile and helpless essays at covering such an area I have ever seen.*

The name of Castle brings one in a somewhat inconsequent way to gossip about the first and greatest of Dublin's eighteenth century monuments which Swift, in his pleasantly caustic manner, begins by qualifying as "a building large and lofty" and goes on—

> Not a bowshot from the College,
> Half the globe from sense or knowledge,
> By the prudent architect
> Placed against the Church direct,
> Making good my grandam's jest,
> "Near the Church"—you know the rest.

This is the famed Parliament House of the Kingdom of Ireland, and the terrible Dean goes on, in his scorn of its legislators, to consign them with his good will to a warm location, and would contemptuously permit them—

> Let them, when they first get in,
> Sell the nation for a pin.
> Let them rave at making laws,
> While they set a-picking straws.

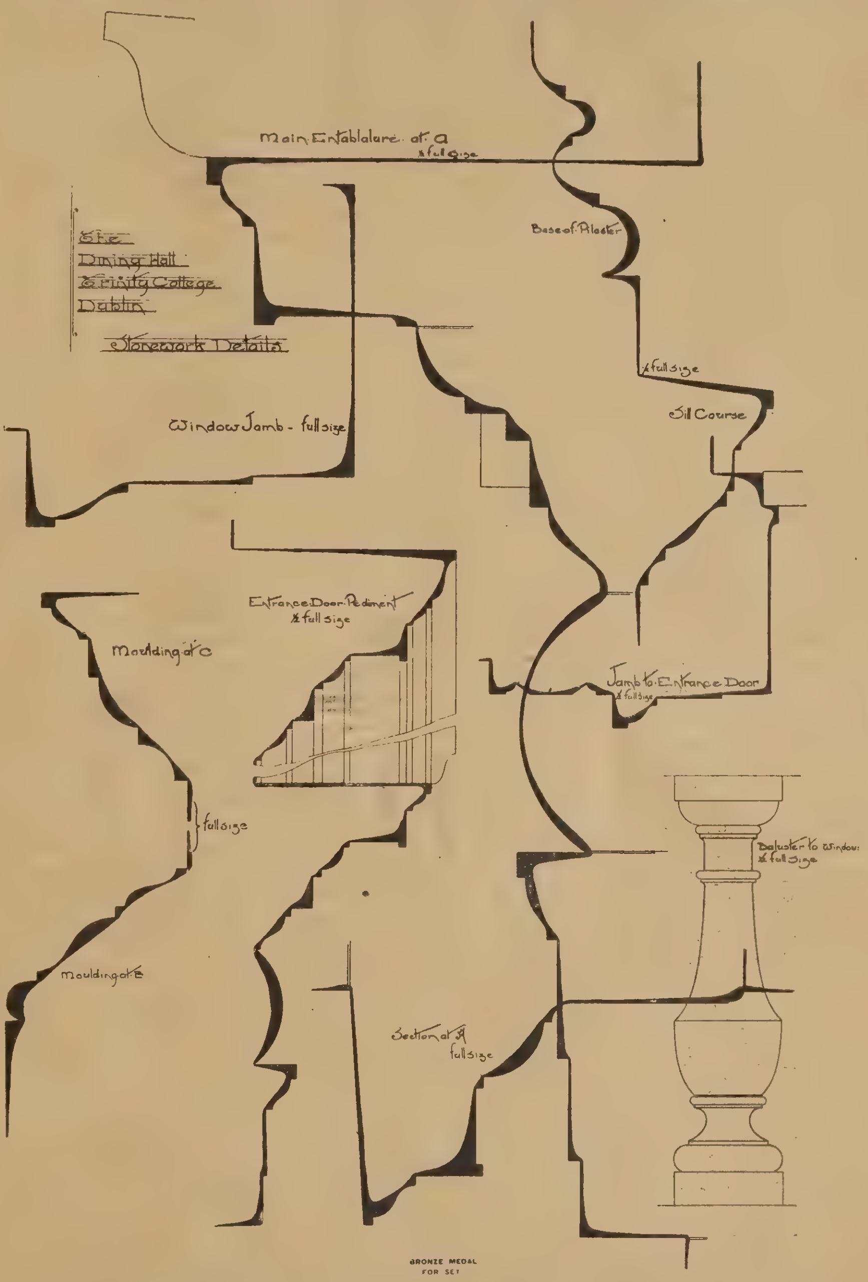
Whatever the legislators may have been, they started a fine monument on a noble and liberal scale about 1728-9. They cleared away old Chichester House, with its gardens running down to the Liffey, and laid the foundation of the Irish House of Parliament. The question is naturally asked: who was the original architect? and here, as history repeated itself in the later building of the Imperial Houses of Parliament, we have a professional scandal and controversy. Captain Edward Lovat Pearce, Surveyor-General, gets the credit in official records; but even in his day there were detractors—one especially who, in correct Latin verse, plainly shadowed the existence, 167 years ago, of the more lately known architectural ghost! Castle, or Castellus, as he calls him, he plainly says was the real architect ghost if people only knew it. A young captain of Neville's troop of Dragoons, and straight from campaigning in the Low Countries, must have been a very remarkable young military man if he had time to acquire such erudite and academic knowledge of Classic architecture as is evinced in the beautiful half-quadrangle court of the Bank of Ireland, with its grand flanking pedimented wings and excellent detail. I don't believe in Captain Pearce. The ghost was somewhere. We are carried back for a parallel to an official superstition of our own day attaching an innate and Heaven-born genius to the corps of Royal Engineers. We carry back our memory to a young Captain Fowke, R.E., architect, born not made, without any architectural training, and who, under a South Kensington ghost system, developed the "Brompton boilers" of 1863, and also spoiled an able architect's design, our Irish National Gallery.

The history of the grand complete design of this Bank of Ireland as we now have it is curious and humiliating to our scholastic prejudices about "composition." In fact, no one designed it. It *grew* by a series of happy accidents, or rather, the four or five architects who in a century's course followed Pearce or Castle, were wonderfully sympathetic and self-suppressive.

The original conception was but the Centre Courtyard design, flanked and hampered by mean houses abutting on each side. Daly's famous club-house shouldered it on the west; other mean neighbours upon the east, for Westmoreland Street and College Street were not to come for eighty years after.

The first architect to go beyond this was Robert Parkes, who in 1787 had the ground cleared for him of Daly's Club, and Foster Place became possible. With great judgment he invented the quadrant sweep, in his day an open loggia of detached Ionic columns, curving towards the western portico which now fronts Foster Place. A little later, James Gandon had the chance to erect a lords' entrance at the east. He followed Parkes' idea of the quadrant sweep, but in his work treated a solid plain wall with mock window recesses. I have lately deposited in the National Museum, Gandon's original drawing by his own hand which makes this clear. We all in Dublin know the story of him and the use of Corinthian columns under an Ionic entablature in his west portico, and his reply when he was twitted with questions as to what order of architecture this was. "The order of the House of Lords and be d——d to them."

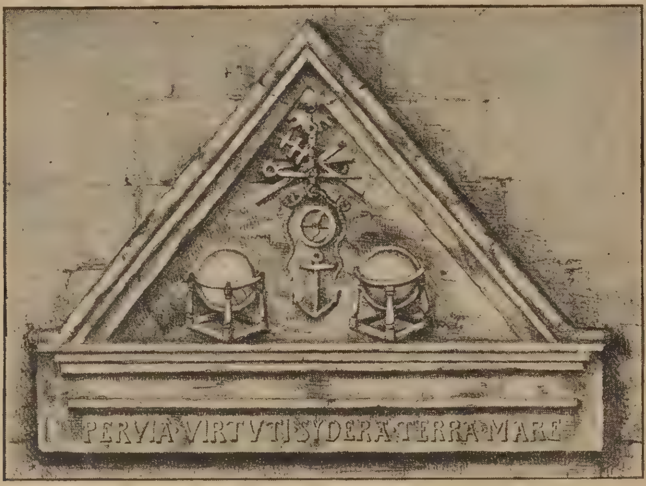
(To be continued.)



DINING HALL, TRINITY COLLEGE, DUBLIN: DETAILS OF STONEWORK. DRAWN BY J. F. DELANY.

---

* In connection with the study of roofs to be made in Dublin buildings, the student is advised to give attention to the roof over the round room of the Mansion House, a circle of 100ft. in diameter. It is without lateral tie from the wall-plate to the apex, unpurlined, unstrutted and stable. It is a remarkable but very simple construction, of which detailed drawings would be interesting. It is credited to an architect named Semple, and was said to have been built up within six weeks for the City Banquet given to George IV. in 1821.



PER VIA VIRTVTI SYDERA TERRA MARE

TABLET AT TRINITY HOUSE, LEITH.

THE ARCHITECTURAL ANTIQUITIES OF LEITH.*

By JAMES CAMPBELL IRONS.

THE origin of the Port of Leith is wrapt in obscurity. The first reliable mention of Leith is in the foundation Charter of the Abbey of Holyrood House, granted by David I. in 1128, and it is stated that the first houses erected in Leith were built in the twelfth century on land bounded on the south by the Tolbooth Wynd, on the west by the shore or quay, and on the east by the Rotten Row, now called Water Lane or street. The architecture of these would, no doubt, be adapted to the age in which they were constructed. Such specimens of ancient architecture as survive everywhere reflect, to a large extent, the feelings, thoughts, aspirations, and ability of the inhabitants of the times. Ruskin truly says that "the art of man is the expression of his rational and disciplined delight in the forms and laws of the Creation, of which he forms a part," and so in the measure in which his reason has been disciplined by the wide study of these forms and laws, cultured by the varied knowledge of their beauty and adaptability, will his expression of them in art be rude or refined. This is well illustrated by reference to ancient Greek and Roman architecture, as well as by the more modern examples of Gothic, Byzantine, and Norman architects, but, above all, by the fact that in all the schools the best examples of this art are to be found in connection with the highest and noblest faculty of man—his religion. The Church in all ages has claimed and found the highest and best expression of man's art in the designs and building of her cathedrals and churches. It would be idle, therefore, to go to a small seaport on the east coast of Scotland in search of noble examples of architecture.

Imagine, then, that instead of sitting here in this beautiful hall, listening to the dilettante day dreams of an over-worked lawyer, you are sitting or walking on the margin of a lovely loch, and desire to pay a visit to the seaport of Leith. You send to-day to book your seat on the coach for to-morrow for the journey to Leith. Starting from the High Street, you wend your way by a road somewhat near the present Easter Road through green fields and pastures gay. On reaching the roadway which now forms Leith Walk, the first building which strikes your eye would probably be Pilrig House. Regarding it Mr. Balfour Paul says in your own transactions that there is not much to be definitely ascertained about the lands of Pilrig in very ancient times. It must always have been a place of considerable amenity, and its proximity both to Edinburgh and Leith would make it valuable both as a residence and for agricultural purposes. There was a curious tradition which lingered in a family, the last survivor of which I, as a boy, can remember. He dwelt as his people had, I believe for many generations, in a cottage with a kailyard attached, at the head of the old avenue, and between it and Leith Walk, as a tenant of the laird. The site of his cottage is now occupied by Balfour Street. The tradition I refer to, which he always maintained to be correct, was to the effect that Pilrig had been a country residence of Mary of Gueldres, the Queen of James II., the foundress of Trinity College. This would take us back to the middle of the fifteenth century. Coming to actual facts, we find a Monypenny in possession of the lands in 1506, and his descendants held them for many years after. They were part of the large barony of Broughton, which David I. had granted to the Abbey of Holyrood. After the Reformation, Adam Bothwell, Bishop of Orkney, got a grant of the barony, which he in his turn surrendered in 1587 in favour of Sir Lewis Bellenden of Auchnowl, the Lord Justice Clerk.

From the Monypennys the lands of Pilrig passed to Gilbert Kirkwood in 1623. He it was who built the house which still stands, a good example of the style of the period—as Messrs. MacGibbon and Ross say (Castellated and Domestic Architecture of Scotland, vol. V., p. 343)—in the absence of all defensive features, and the introduction of Renaissance details in its quaintly formed gables and chimneys.

The original entrance door was on the ground floor, and was surmounted by a carved pediment, containing probably the arms of the founder and of his wife, Margaret Foulis. Their initials, G. K. and M. F., are cut on each side of the shield, and the verse of scripture—"For we know that if our earthly house of this tabernacle were dissolved," &c. The date of the actual erection of the house is 1638, as shown by its being carved on two of the windows. The west gable is of exceptional thickness, having to hold a wide kitchen chimney; this makes space on the first floor for a deep alcove on one side, and a small strong room on the other, at one time probably furnished with an iron door. At present there is within it a fine iron chest, which tradition says was one of the "treasure chests" contained in one of the ships of the Spanish Armada. The door into the garden from the first floor is a later alteration, though it is probably earlier than the time when the new dining-room and drawing-room were built. I do not know whether Gilbert Kirkwood has the credit of planting the long avenue to the south of the house, leading up to Leith Walk, or of laying out the grounds as a whole, but no doubt they were laid out about that time and the whole place must have had singularly pleasant surroundings; indeed, up to quite recent years, when the stone-and-lime demon could no longer be repelled from its vicinity, it continued to be a very pretty old-world spot, and so long as the old house stands, and the garden blossoms and fruits year by year, it will never altogether lose its character.

SEAL OF THE PRECEPTORY OF ST. ANTHONY.

The Kirkwoods disappeared from Pilrig after what must have been a comparatively short reign, for in 1717 it was sold by Sir William Douglas to William Alves. Indeed for the next year or two it changed hands with quite startling rapidity. Alves sold it in the same year in which he bought it to Lord Rosebery, and he in his turn seems to have almost at once disposed of it to James Balfour, merchant in Leith, in whose family it has remained ever since. While the Balfours only became possessed of Pilrig in 1718, some family of the name had lived in the neighbourhood many years before; for we find the lands of John Balfour mentioned as bounding a croft

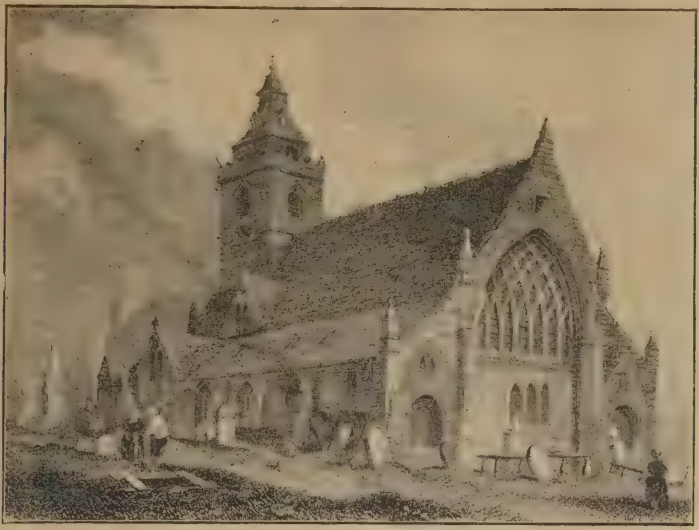
* A paper read before the Edinburgh Architectural Association on March 8th, 1899.



ST. MARY'S CHAPEL, SOUTH LEITH.

granted by Matthew Forrester, the head of St. Anthony's Preceptory, Leith, to David Forrester, in a charter which was confirmed by the King on 23rd January, 1570-1571.

Readers of Robert Louis Stevenson's books (whose mother was the daughter of a cadet of the Balfours of Pilrig) will remember that at the end of "Kidnapped" the heir is left on the point of going to consult his kinsman, the laird of Pilrig, and he figures somewhat largely in the subsequent account of David Balfour's adventures in "Catriona." James Balfour, the laird referred to, was Professor of Moral Philosophy from 1754 to 1764, when he was transferred to the Chair of Public Law, which he held for fifteen years. He was also Treasurer of the Faculty of Advocates. (Trans. Edinburgh Arcitectural Association, Vol. II., p. 204.)

Proceeding down Leith Walk, you enter what is now the Kirkgate. A few yards from the top of this stood the ancient Monastery of St. Anthony, erected by Sir Robert Logan. It was situated near where the Parish Church of South Leith now is, on the west side of the lane known as St. Anthony's Lane. Little or nothing is known of the architectural construction of this monastery, save that it was a building of considerable size and strength. On its tower the French placed their artillery during the siege of 1560, when the building was partially destroyed; it was partially restored and converted into King James's Hospital in 1614. All that remained of this ancient and interesting edifice a few years ago was a portion of the doorway and arch, but even these have now been swept away, and nothing now remains to tell of the existence of this monastery save the revenues of King James's Hospital, which are collected by South Leith for behoof of the poor of the parish.

The Rental Buke of Sanct Anthon's and Newhaven, written on vellum, and consisting of a thin octavo volume of twenty-one leaves, is still preserved in the Advocates' library at Edinburgh. There is not much recorded in it about the rentals or indeed any of the secular affairs of the monastry. It contains a list of benefactors and the form of initiation into the confraternity of St. Anthony, the rules to be kept and the indulgences to be gained by its members. The seal also of the preceptory is likewise preserved in the same library. It bears the inscription *S. Commune Preceptorie Sancti Anthonii prope Leight*, and assumed a very graceful form, representing the saint gowned as a hermit, standing under a canopy. Behind him, and showing chiefly at his right foot is the wild pig with the bell on his neck. The bell is again happily repeated in the lower part of the design, while in its upper part appears the capital T, or Tall Cross, which was made of blue stuff, and sewn on the left breast of the black mantles that were worn as the distinguishing garb of the canons of St. Anthony. It is probably a production of the sixteenth or seventeenth century.

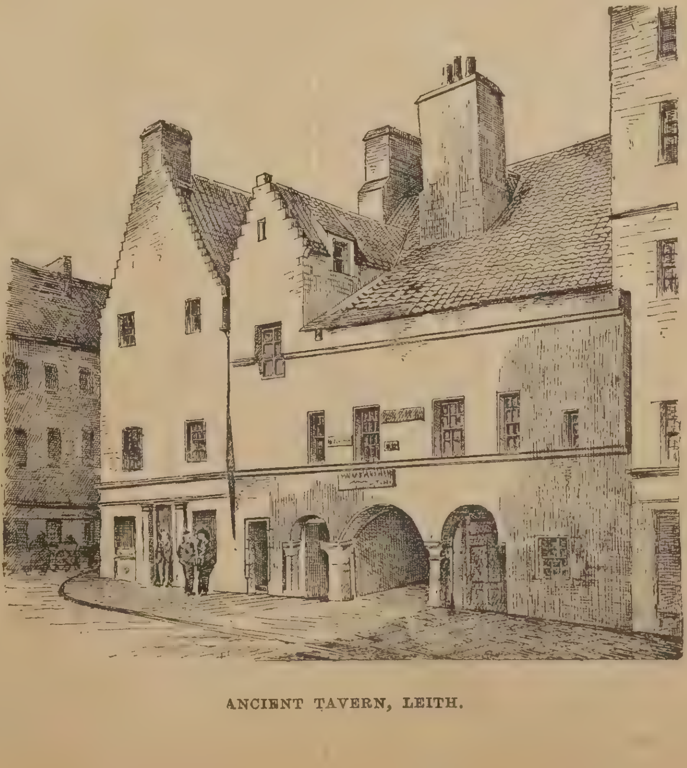
In 1817, on the site of the old building, the present Trinity House was erected on the western side of the Kirkgate, and opposite to St. Mary's Church. Two of the tablets that adorned the ancient hospital were built into the south wall, which faces Giles Street. One of them, surmounted by a pediment elaborately sculptured with an anchor, globes, and a group of nautical instruments, is inscribed :—*Pervia . Virtuti . Sydera . Terra . Mare.* On the other is cut in large ornamental characters of that olden time the following inscription : —*In . The . Name . of the . . Lord . Ve . Masteris . and . Mareneris . Bylis . this . Hous . To . ye . Pour. Anno . Domini*. 1555.

In 1848, while Mr. George Adinston McLaren was provost of Leith, and a member of South Leith Church, it was repaired and altered. The architect superintending the restoration was Mr. Thomas Hamilton. A new square tower, terminating in a richly cusped, open Gothic balustrade, was erected at the west end, and around the building were placed buttresses finished with crocketed finials. Wilson says: "St. Mary's Church, as it existed at the time our drawing was made, showed at the east end two of the four great central pillars of the church, and was otherwise finished by constructing a window in the upper part of the west arch of the central tower, much in the same style as was adopted in converting the nave of Holyrood Abbey into a parish church. The date 1614, which was cut on the east gable, probably marked the period at which the ruins of the choir were entirely cleared away. The side aisles appear, for the most part, to be the work of the same period. A range of five dormer windows was constructed at that date above both the centre and side aisles, and, though a novel addition to a Gothic Church, must have had a very picturesque and rich effect. The whole of these, with the exception of the two western ones on the south side of the church, were taken down in 1747" (vol. 2., p. 193), and the remaining ones were removed in 1847, along with the east and west gables of the church. By the removal of the high-pitched roof of the side aisles there was brought to light a range of very neat, square-headed clerestory windows, which had remained concealed for upwards of two centuries, and which have been retained in the restored building.

The hand of the restorer has, during the last fifteen years, been again at work on this interesting old church, which is now one of the most beautiful ecclesiastical buildings in Scotland. The pulpit, which was an old "three-decker," has given place to an exquisite alabaster and marble pulpit—one of the finest to be found out of Italy—of hexagonal shape, with marble figures of the four Evangelists and of the Good Shepherd, on five of the panels, while the sixth side forms the entrance to the pulpit, which rests against the second pillar of the church.

On the opposite side of the street was an ancient tavern or hostelry, stated to have been visited by Queen Mary, Charles I. and Cromwell. It was also said to have been the scene of the murder of two Frenchmen under rather tragic circumstances. The building is rather a characteristic specimen of ancient Scottish architecture. It was for some time a question whether this was the same building as the fine arcaded house we now show you, but I think there can be little doubt that it is the same place.

To the east of the Trinity House, on the north side of the Kirkgate, a very singular building fronted the main street at the head of Combe's Close. The upper storeys appear to have been erected about the end of the sixteenth century, and formed rather a neat and picturesque specimen of the private buildings of that period. But the ground floors presented different and altogether dissimilar features. An arcade extended along nearly the whole front, formed of semi-circular arches, resting on massive round pillars, finished with neat moulded capitals. Their appearance was such that even an experienced antiquary, if altogether ignorant of the history



ANCIENT TAVERN, LEITH.

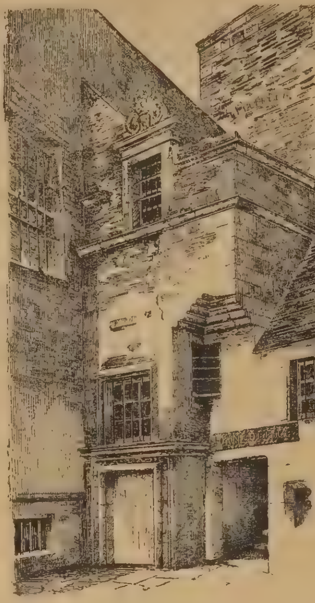
of the locality, would at once pronounce them to be early and very interesting remains, probably of the style of the sixteenth century.

That they were of considerable antiquity cannot be doubted. The floor of the building was several feet below the level of the street, and the ground had risen so much within one of the arches which served as an access to the court behind that a man of ordinary stature had to stoop considerably in attempting to pass through it. No evidence is more incontrovertible as to the great age of a building than this. Other instances of a similar mode of construction are, however, to be found in Leith, tending to show that the style of architecture is not a safe criterion of the date of their erection. The most remarkable of these is an ancient edifice in the Sheep's Head Wynd, the ground floor of which is formed of arches constructed in the same early style, though somewhat plainer and less massive in character, while over the doorway of the projecting staircase are cut in ornamental characters the initials and date D.W. M.W. 1579. The edifice, though small and greatly dilapidated, is ornamented with string courses and mouldings, and retains the evidences of former grandeur amid its degradation and decay. Maitland refers to another building still standing at the north-west corner of Queen Street, which in his day had its lower storey in the form of an open piazza; but modern alterations have completely concealed this antique feature. Here was the Exchange, or meeting-place of the merchants and traders of Leith for the transaction of business, as was indicated by the popular name of the Burss—evidently a corruption of the French term of Bourse—by which it was generally known at a very early period.

Entering from the Kirkgate is the original doorway of Lord Balmerino's house with some very quaint and rather peculiar corbelling bringing a broken angle into the square above and, so far as my knowledge goes, it is a unique specimen of this contrivance which was such a favourite device of the Scottish builders of this period. Considerable picturesque effect is got beneath by placing the window at a curious angle; the dormer window above is of the same quaint design as the windows of Heriot's Hospital, Glasgow College, and Winton House, with the same open fretwork.

On the east front of the house and behind the Roman Catholic Church there is a remarkably fine specimen of pure Renaissance architecture. It appears originally to have been a doorway with Corinthian fluted pillasters with frieze and pediment above—the whole thing being of the most delicate and refined detail. It is now used as a window and has been so for long—the wood work with the tramsome being of great interest, and is the very kind of thing which modern architects are trying to introduce to supersede the plate glass window which ruled in our windows some years ago. This is probably the work of one of the Adams.

One of the earliest dates that has been discovered on any of the old private buildings of the burgh occurs on the projecting turnpike of an antique tenement at the foot of Burgess Close, which bears this inscription on the lintel in Roman characters: "Nisi. Dvs. Frvstra. 1573." There is, however, an earlier date, as we shall see. This date is inscribed on the hand-saw device on the lintel, so characteristic of Italian work. Burgess Close is the earliest thoroughfare in Leith which we find mentioned, being granted to the burgesses of Edinburgh towards the close of the fourteenth century by Logan, of Restalrig, as a means of access to the shore. But the straitened proportions of this narrow alley, as it was then, and through which the whole exports and imports of the shipping of Leith was conveyed, soon proved so inconvenient that the Laird of Restalrig was compelled to grant a more commodious access.



ORIGINAL DOORWAY OF LORD BALMERINO'S HOUSE.

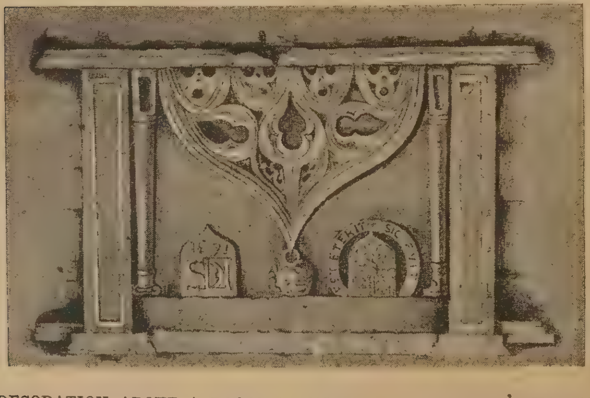
"The inscription," says Wilson, "which now graces this venerable thoroughfare, though of a date so much later than its first construction, preserves a memorial of its gift to the civic council of Edinburgh, as we may reasonably ascribe to the veneration of some wealthy merchant of the capital the inscribing over the doorway of his mansion at Leith the very appropriate motto of the city arms. To this, the oldest quarter of the town, indeed, we must direct those who go in search of the picturesque." But the old Burgess Close has been swept away, and a much wider thoroughfare now occupies its place.

(*To be concluded.*)

Messrs. W. H. Murray and Company, of 47 and 48, King William Street, E.C., have obtained the contract for the supply of 6,000ft. of Yorkshire stone to the Greenwich District Board of Works.

The New St. George's Hall and Schools just erected in the Old Kent Road, by the South-east London Mission of the Primitive Methodists, were designed by the late Prof. Banister Fletcher.

The New Church at Stanton Hill, the foundation stone of which was laid by the Countess Dowager of Carnarvon, is to cost about £1,400. The plans have been prepared by Mr. P. H. Curry, of Derby, who has adopted the Early English style, cruciform, with nave, chancel, vestry, organ chamber, and west porch, open timber roof, done with red tiles. Mr. R. Wilson, of Skegby, is the contractor. The building will seat 360 persons.



DECORATION ABOVE A DOORWAY IN LORD BALMERINO'S HOUSE.

. . A NEW . .

TRADE JOURNAL

(ISSUED TO SUBSCRIBERS ONLY).

There will shortly be published, from the offices of the BUILDERS' JOURNAL AND ARCHITECTURAL RECORD, a trade journal for all interested in Furniture, Decoration, Upholstery, Art Metal Work, Stained Glass, Ironmongery, Brassfoundry, Electroplate, and Art Pottery.

THE FURNISHER,

as the new journal will be named, will be produced in a style never before attained by any trade journal. The paper and printing will be of a superior quality, and the illustrations will be reproduced in a style similar to those in the ARCHITECTURAL REVIEW and other high-class Magazines.

THE FURNISHER will contain articles by

Acknowledged Experts

in their respective trades, and will illustrate the work of the most eminent designers and manufacturers. The subjects treated will include all branches of the furnishing trades, and the journal will be, in fact,

Seven Trade Journals in One.

Suggestions of the greatest practical value to all engaged in the trades, whether manufacturers or retailers, will be given

All trade news will appear in THE FURNISHER, new inventions will be noted, new books reviewed, and questions of interest discussed. Commercial information will be given in detail, and the journal will be indispensable to every person who designs, manufactures, sells or buys what goes to the furnishing or decoration of either public building or private house.

THE FURNISHER will be published monthly, price 6d., but will only be obtainable by Subscribers, who must be connected with the Trade.

Offices:—Effingham House,
Arundel Street,
Strand, London

Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor.

RIGHTS OF LIGHT.

To the Editor of The Builders' Journal.

Hove.

Sir,—I thank you for your esteemed reply in your issue of the 9th inst. The question is printed thus: "There are windows at side of house." It should read, "There are no windows at side of house." Would this fact alter your opinion?—Yours truly,

Conservative.

The answer is correct in regard to the question as originally submitted. The word "no" was omitted by a printer's error.

BOOKS FOR BUILDING CONSTRUCTION STUDENTS.

To the Editor of The Builders' Journal.

Cambridge.

Sir,—I shall deem it a great favour if one of your valuable contributors would kindly inform me what is the best text book on mechanics (practical) in the building trades, or the best on machines in use, such as the winch, derrick crane, pulley blocks, and methods of hoisting and conveying materials. Also works on graphic statics, algebra and mensuration, and simple mathematics, suitable for a building construction student working for Honours Certificate, and encountering difficulties in the formulæ.—Yours, &c.,

JASMINE.

The best books you can have are as follow; they can be obtained for the prices quoted from Mr. B. T. Batsford, of 94, High Holborn, W.C. Tarn's "Mechanics of Architecture," 6s., post free. Middleton's "Stresses and Thrusts," 4s. 2d., post free. Higg's "Algebra Self-Taught," 2s., post free. Mitchell's "Elementary and Advanced Building Construction," post free for 2s. 6d. and 4s. 6d. respectively.

SANITARY CERTIFICATE AND HYDRAULIC LIME.

To the Editor of The Builders' Journal.

Seaforth.

Sir,—I should be obliged to you if you would, in the next issue of the Journal, advise me what to do in the following case: (1) I have for three months been preparing for the Manchester exam. of the Sanitary Institute in December, but I have been told that it is only a waste of time and money, as the Local Government Board are issuing a certificate to candidates successful in examination, and that the certificate of the Sanitary Institute will be of very little use, that the value of the L.G.B. certificate will be so much greater. Would you kindly tell me if it would be advisable to try for the Sanitary certificate in December, or wait and try for the new one. (2) Also in the following: If I went on to a job where hydraulic lime was supposed to be used for the mortar, and the mortar was not ground on the job, what would be the best way to tell whether the lime was hydraulic or not? Thanking you in anticipation, and wishing your paper continued success.—Yours, &c.,

APEXIS.

(1) All appointments of the nature referred to are made subject to the approval of the Local Government Board, such approval being rarely withheld when evidence of competence, in the form of the certificate of the Sanitary Institute can be produced. (2) It would be best to take some of the lime, mix it with sand to a mortar, make a sandwich of it between two bricks, lay in water and await developments. If something more rapid is required, place a little of the lime in a saucer, and pour hydrochloric acid over it, when all the lime will dissolve away with effervescence, leaving a residue of clay if it be hydraulic, of sand if it be poor, and no residue if it be pure.

G. A. T. M.

BOOK ON BUILDING CONSTRUCTION.

To the Editor of The Builders' Journal.

London, S.E.

Sir,—Will you kindly inform me as to the best book I could get on "Building Construction."—Yours truly,

J. C.

The standard work on the subject is Rivington's "Notes on Building Construction," and you cannot do better than obtain this It is published by Longmans, Green and Co., and the price of Part I. (elementary stage) is 10s. 6d.

REVERSE MOULDINGS.

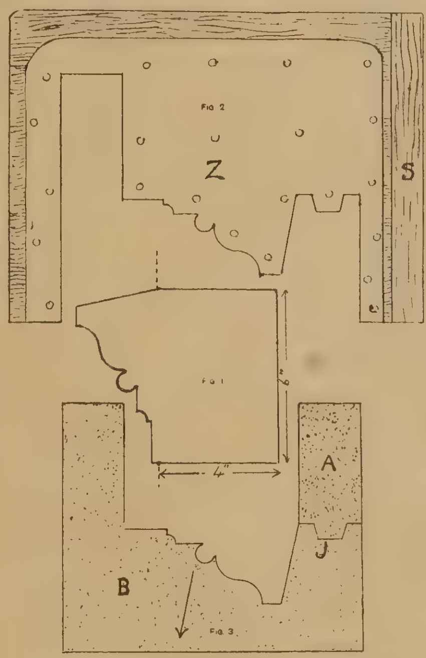
To the Editor of The Builders' Journal.

Sheffield.

Sir,—Could you inform me the best way of making a reverse mould for casting concrete impost moulding? A sketch illustrating method would be useful to me as well as other readers of the Builders' Journal.—Yours, &c.,

F. S.

Cast concrete mouldings for brick façades are usually designed by the architect to fit the thickness of one or more bricks, so as to avoid cutting the brickwork, and to enable the brickwork and concrete mouldings to "course." The concrete mouldings are made with a sufficient breadth so as to form a bond or bed in the wall. Fig. 1 shows a section of a simple moulding sufficient to elucidate the method of setting out a reverse running mould and casting mould for casting concrete impost mouldings. The moulding is 6in. deep, as figured, to suit two courses of brick, and has a bed of 4in. The dotted lines indicate the face of the brickwork. The running mould for forming a reverse casting mould is cut from the inner profile of the given design of a moulding, being the reverse way used for an ordinary running mould, which is cut from the outer profile of the design. Fig. 2 shows the section of the running mould, Z is the zinc plate nailed on to the stock of the mould, and S is the slipper. The running mould is used for running the casting mould; a casting mould made by the reverse method is run direct with a reverse running mould, which is the contrary way employed for an ordinary casting mould, which is always taken from a model or moulding-piece. Some mouldings require a reverse piece mould, as in the present case. The loose pieces are used for under-cut parts on the mouldings, and to enable the cast to be easily extracted from the mould. The setting-out of a reverse running mould requires considerable skill and care, so that the necessary loose pieces will be strong, work freely, and have the joints at the proper places and angles. Fig. 3 shows the section of the reverse casting mould; B. is the body of the mould as run by the running mould. When setting out a reverse running mould having loose pieces, as shown at A, run joggles should be allowed for where space permits. A run joggle, or sinking, is shown at J. The loose piece A is formed on the body of the mould by the aid of two rules, one fixed on the inside and one on the outside of the body of the moulding. The loose piece can be stopped from moving lengthways by filling up two or more parts of the run joggle, each part being about 2in. long. These parts must be well scratched before the plaster is applied to form the stops. The ends of the casting mould are formed with wood stops. Plaster moulds for casting concrete should be allowed to dry, and then seasoned by coating the surface three or four times with a combination of linseed oil and boiled oil. When the casts are filled in and set, a board should be placed on the top of the mould, and then the whole turned over, so that the cast will lie solid on the board. The body of the mould should be drawn off in the angle most suitable to free the mouldings, in the present case as shown by the dart. Beads that are highly undercut may be "humoured" when setting out the running mould, and the undercut formed by the aid of a file while the casts are green. Large beads having deep undercuts may be readily formed by means of a loose piece, but as this method entails a joint on the bead, which is somewhat difficult to clean off the cast, it will in some cases be found advisable to relieve the bead with the aid of a file.



W. MILLAR.

BOOK ON ARCHITECTURAL DESIGN.

To the Editor of The Builders' Journal.

Gravesend.

Sir,—Will you or any of your readers kindly inform me of the title of a suitable text book to study architectural design? I should like a practical book, as I wish to sit for the examination of the Science and Art Department next year.—Yours respectfully,

VESWOR.

The best book you can have is Fletcher's "History of Architecture," published at 12s. 6d. This can be obtained from Mr. B. T. Batsford, of 94, High Holborn, W.C., post free for 10s.

A BOTANICAL GROWTH.

To the Editor of The Builders' Journal.

Loughboro'.

Sir,—I shall be much obliged if you will explain to me the growth of which I send a sample which I have found forcing its way through an old 9in. internal brick wall. Apparently it has originated from an oak lintel, of which I send you a small piece, showing the discoloration on the face. From this point in the wall the growth I have sent you is a specimen of what I have found between the bricks and the mortar joints, both vertical and horizontal for a distance of at least 5ft. from this lintel. It has also forced its way between the joints of the "relieving arch in cement" over same, and the "plaster" on both faces of the wall. In some instances it seems to have destroyed the nature of the mortar, but not in all cases.—Yours, &c.,

A. L. R.

We are indebted to Professor J. B. Balfour, Regius Keeper of the Botanic Gardens, Edinburgh, for the following reply: "The membranous growth is the mycelium of a fungus and, I believe, the dry-rot. It is either that or one of the Polypori, perhaps *polyporus vaporarius*. It is not a robust growth, but it has undoubtedly been growing under the usual conditions which dry-rot affects. The piece of oak lintel has upon it a growth of a fungus belonging to the genus *sporodesmium*, and the black spots are the spores. The pink colour is perhaps due to some change the fungus has brought about in the wood. The plant is probably *sporodesmium polymorphum*, and it grows freely as a saprophyte upon decayed wood."

WELLS CATHEDRAL.

By W. LEE CLARKE.

The City of Wells is situated in a wide, rich valley, with the rocky Mendips backing it on the north side. It is a quiet and clean little place, still it would be worthy of little notice but for its cathedral. This building is admirably placed. When the cathedral green, a large fine lawn, is entered through a gateway from the market square, the finest view of the western façade is obtained, as shown in the illustration in our centre plate.

Of this west front, Collison says, "It is esteemed one of the most superb pieces of Gothic architecture in the kingdom, being loaded with a profusion of beautifully-carved images in niches or recesses, the vaults of which are supported by slender pillars of Purbeck marble." The images are all symbolic. At the top of the central gable stand the twelve apostles; below them is the hierarch. Representations of the resurrection; life-size statues of kings, queens, bishops, &c., are depicted, being examples of the very highest type of Early English carving.

The cathedral is surrounded by the finest collection of domestic buildings to be found anywhere. This may be attributed to the fact that Wells was never a monastic foundation, each official having his own dwelling.

The peculiar charm of this cathedral lies in the union and harmonious grouping of the various parts, palace, cloisters, lady chapel, choir, &c. These parts, if examined separately, may be equalled or possibly excelled in beauty by other cathedral buildings, but as a group of buildings, Wells certainly has no equal. To appreciate this beauty it is necessary to climb to the woods on the Shepton Road, from which spot a fine spectacle is obtained, as depicted in our illustration. In the distance stand the Western towers, seeming more lofty than when viewed from the front; at the intersection of choir and transept rises the fine central tower, with its pinnacles, the octagonal Lady Chapel, the rich Eastern window, the chapter house, &c.; all these are clearly seen. The chain gate or gallery over the road by the north transept (shown on the drawing of the west front) is a very interesting feature. It connects the chapter house with the vicar's close, a set of dwellings designed for the accommodation of vicars, clerical and lay.

It may be interesting to note the size of this cathedral. From east to west measures 385ft., and across north and south transepts, 135ft. It is but four feet longer than Lichfield, which is the smallest English cathedral. The greatest bishop of Wells was Jocelyn, who was among the signatories of the Magna Charta.

A New Baptist Chapel at Plymouth is to be erected from designs by Messrs. Wiblin and De Boinville, of Plymouth, by Mr. J. Paynter, of Plymouth. The new chapel, which will have a frontage of 38ft. 6in. on the North Road, is early Gothic in style. It will be built of brick, with stone dressings, and will seat 240 adults. The plans provide for one large central main entrance and one side entrance, both fronting on the main road. At the rear of the chapel will be two vestries, with lavatories and a back yard and entrance, and in the basement a boiler-house and store.

New Free Church for Cullen.—The foundation stone of a new Free Church at Cullen was laid recently. The style of architecture to be adopted is Gothic of simple Scottish character. The dimensions over the walls are 75ft. in length and 42ft. in width. On the right side there is to be a tower, 12ft. square and nearly 100ft. high, with four dials and bell. The prominent parts of the building will be of rustic freestone. Sitting accommodation will be provided for 410 persons on the ground floor and eighty in the gallery. The interior woodwork is to be of pitch pine.

Views and Reviews.

THE MYSTERY OF THE CATHEDRALS.

What is a reviewer to say of such an extraordinary farrago as this handsome volume, beautifully printed, illustrated with eighty-eight splendid photographs? In the first place, he must humbly confess that he does not know what the writer is driving at, so confusing and desultory is the method in which the subject is presented. So far as can be gathered, it seems to be an attempt to re-write the architectural history of the world from the fourth century onward. It seems that Early Christian, Byzantine, Romanesque, Gothic, Renaissance architecture are due to—what does the reader suppose? To a little trades' union located in the little island of Comacina, near Como. This Comacine guild, moreover, is identified with a collegium of Pagan or Imperial Rome, and apparently with Solomon's Temple, and with our old friends the Freemasons. And what is the evidence for this amazing thesis? It is this: all the architects of Western Europe at any given period were designing in one and the same style, therefore there must have been one and the same governing influence; therefore that influence must have been a guild. We would humbly suggest, on the same line of argument, that in England, Australia, Canada, and the United States just now people are speaking one and the same language; therefore there must be some mysterious guild—and why not the Comacine Guild or the Freemasons'—regulating, unbeknown to everybody, the grammar and literary style of every English-speaking country. The supposition seems to us quite as reasonable as that of the "Cathedral Builders."

Secondly, what are the methods by which the writer tries to establish this amazing theory? They are charmingly simple. Assume—without proof of any sort—that interlacings and crouching lions are the trade-mark of the Comacine guild; then you can attribute to the guild with certainty, as the writer does, every building where lions and interlacings occur; Early Christian churches at Rome, St. Mark's, Venice, S. Ambrogio, Milan, Worms Cathedral, Milan Cathedral, and why not the lions of Trafalgar Square and the common domestic basket of the Covent Garden porters? Thirdly, what are the authorities on which the writer relies? Among them bulks largely that ancient author, Mr. Thomas Hope, whose sympathy with the great Freemason myth endears him to the writer. Cattaneo is quoted only to be ignored and disregarded.

Lastly, what are the writer's own qualifications for the work; what knowledge of architecture does this big book show? Well, here are some choice specimens, culled at random. Page 1, line 5, "Romanesque architecture led to the Renaissance," which is as if I should say "The Elizabethan drama led to Alexander Pope." "In the thirteenth century the mixture of pointed with round arches is found contemporaneously in Italy, France, and England." This is indeed news It was vulgarly believed that the characteristic mark of French and English Gothic in the thirteenth century was the total disuse of the semi-circular arch. In the next paragraph we are told that Salisbury, Beauvais, and Laon were built in the fourteenth century; we had ignorantly supposed that Laon was built in the twelfth century; Salisbury and Beauvais in the thirteenth. On the next page we hear of "the glorious winged flights of the full Gothic of the Renaissance." One might as well talk of the glorious winged flights of the romanticism of Crabbe and Akenside. Here is another: "Just as the interior of S. Michele, Pavia, is the most perfect existing example of the classical form reduced by the Comacines to Christian use and symbolism, so is the façade as perfect a specimen of their mediæval-oriental decoration at this time as can be found." What can this mean? It is cruelty to set such a riddle in such hot weather. The mausoleum of King Pepin is stated to be in the crypt of S. Leno, Verona; it is not in the crypt at all, but in the open churchyard to the south of S. Leno. The writer knows of "very few church towers that are round except that of St. Apollinare in blasse near Ravenna." Why, there are several in Ravenna itself; and it is amusing to find a photograph of one of them, St. Apollinare Nuovo, later in the book. Really one feels a suspicion that the writer has visited neither Ravenna nor Verona. A valuable suggestion to archæology in general is that at Tournus is to be seen "the first step to the vaulted roof of the later Gothic buildings." Will it be believed that the vaults of Tournus are tunnel-vaults, and those set like the arches of Waterloo Bridge all down the nave? What can this extraordinary and almost unique arrangement possibly have to do with the intersecting ribbed vaults of Gothic? An equally valuable suggestion to English archæology is that Prior Rahere may have brought over Comacines with him from Rome to design St. Bartholomew's, Smithfield. We learn also for the first time that Anglo-Saxon architecture is the result of Comacines also, brought over in the seventh century by St. Wilfrid and Benedict Biscop. And, of course, they were there when the Irish round towers were built: exit the Phœnicians and enter the Comacines.

The whole hypothesis of the book rests on rotten foundations, on chronologies of Hope "whose judgment is unerring on all subjects connected with the Lombard style." S. Michele, Pavia, is an eighth-century church. The pulpit of S. Ambrogio, Milan, is of the sixth century; while "the atrium is indubitably of the ninth century." It never troubles the writer that these two great Romanesque churches are as advanced in style as the eleventh and twelfth-century churches of France, England, and Germany; and that if they are of the eighth century, Romanesque architecture actually stood still in Lombardy for more than 300 years. For there is but little difference between these churches and S. Pietro in ciel d'oro, which is certainly a twelfth-century church. Besides, the Longobards could no more have built such churches in the eighth century than could the Zulu Kaffirs to-day. The book is full of chronologies of equal worthlessness, drawn from authorities discredited long ago. Of critical knowledge of the subject the author has none. The preface states that the chief authority cited, Merzario, had to be rewritten, because he was "bewildering in his redundancy, confusing in his arrangement, and not sufficiently clear in his deductions." If the Italian was half as bewildering, redundant, confusing, and obscure as the writer of the "Cathedral Builders," I pity his readers with all my heart.

F. B.

"The Cathedral Builders: the Story of a Great Masonic Guild." By Leader Scott. Sampson Low: 1899.

IRON AND STEEL INSTITUTE.

ANNUAL MEETING.

The annual meeting of this Institute was commenced last Tuesday week at Manchester. The first paper read was on the Use of Finely Divided Iron Ore obtained by Concentrating Processes. The paper was originally written in Swedish by Professor J. Wiborgh, of Sweden, and was translated by Mr. Bauerman. Professor Wiborgh contended that by the introduction of magnetic and other methods of separation the power of enriching or improving iron ores by the removal of barren or undesirable constituents has been greatly increased, and by the use of such methods the waste in working, in the case of magnetic minerals, at least, can be considerably diminished. The advantage arising from such operations is, however, largely qualified by the circumstances that the product or concentrate is usually obtained as a comparatively fine powder, which limits its utility to the smelter when compared with that of similar or even poorer ores obtained in larger masses, and, therefore, the question of how such material can best be applied is now becoming of importance. Powdered iron ores obtained by concentration may be utilised in several different ways — namely, by direct addition to the charges in the blast-furnace, by agglomeration previously to charging in the blast-furnace, as a refining or softening material in the open-hearth furnace, for the production of sponge iron for use in the open-hearth furnace.

Magnetic Separators.

Mr. H. C. McNeill, in a paper on "Some Forms of Magnetic Separators and their Application to different Ores," said the first application of magnetism as an agent for the separation of a magnetic from non-magnetic substances was probably the permanent hand-magnet used in the machine-shop for separating iron or steel turnings, &c., from brass or gunmetal sweepings. Similarly, foreign oats and grain are freed from bits of iron wire, pieces of cutter blades, nails, needles, &c The railway companies and other large employers of horse labour have found it necessary to subject all the materials utilised for horse food, such as maize and oats, to rigorous mechanical and magnetic cleansing. With the introduction and wider application of electro-magnetism, not only have machines been devised whereby naturally magnetic iron ores are freed from admixtures of other minerals, but by a preliminary roasting in the artificial production of magnetic oxide of iron other ores may be rendered suitable for a magnetic separation treatment.

A New Casting Machine.

Mr. R. H. Wainford, of Stoke-on-Trent, then read a paper describing a new mechanical apparatus for casting sandless pig iron, in insulated moulds, so as to maintain a good crystalline fracture, equal to that of the pig iron made in sand pits, at a reduced cost of production. He said that none of the machines hitherto brought forward for the production of pig iron had really met the needs of iron-masters in this country. The great advantages of sandless pig iron were fully appreciated, but hitherto it had been impossible to obtain this iron unaccompanied by inferior results on fracture. The machine described by the author had been experimented with by Messrs. Palmer's Shipbuilding and Iron Company, and by Messrs. Bell Bros., the latter experiments dealing with Cleveland iron exclusively. The machine was capable of dealing with sixty tons of iron per hour, and the labour cost worked out to about ½d. per ton cast. Mr. Hawdon (Middlesbrough) thought the work could be done cheaper by this new method of casting than by hand labour. Mr. Cooper (Jarrow) said the work was very hard, and in the recent hot weather some of their men had fainted on the pig beds. It was work that no man ought to be put to when they could adopt a machine which at small expense could do the work effectually.

The Iron Industry in India.

A paper on the iron industry in the territory of His Highness the Nizam of Hyderabad was next read by Shamsul Ulama Syed Ali Belgrami, secretary to the Nizam's Government Public Works Department, railways and mines. India had always been the home of iron and steel manufacture, as was amply proved by the enormous slag accumulations scattered all over the country; and if her ancient appliances were too primitive to compete with the requirements of modern trade, there seemed no reason why, as a British dependency, English capital and English enterprise should not be forthcoming to utilise her great natural resources in ore, flux, and fuel, and restore her to her former position as one of the greatest iron manufacturing countries of the East. Nothing but English capital and modern appliances was required to establish a thriving iron and steel manufacture in the premier native State of India.

Major R. H. Mahon, R.A. (Cossipore), contributed a paper on "India as a Centre for Steel Manufacture." The object aimed at by him, he said, was to place before the Institute facts relating to the possibility of manufacturing at a profit iron and steel in India. If it could be shown that suitable materials could be collected and worked into steel at a given centre in India, and at a price not exceeding similar manufacture in Europe or America, it must then be conceded that such steel started in the markets of the East with an advantage equal to the freight charges on imported material. This advantage would never be less than 12s. a ton, and would rise at times to 18s. There was, however, to be deducted from this, the freight charges from the selected centres to other ports, but this deduction could not under any circumstances absorb the whole. India alone as a market was capable of taking a very large quantity of manufactured steel, and its requirements were certain to increase for a number of years. The conditions which appeared to offer the greatest prospects of success were the establishment of a steel works on a large scale capable of undertaking the whole or a large part of the requirements of India, both as to rails, sections, and plates, to be situated either on the Hooghly below Calcutta, or on the Mutlah river at or below Port Canning.

In the afternoon the members visited the Lancashire and Yorkshire Railway locomotive works at Horwich, the Barrow Steel Company's collieries, and the Wharncliffe Silkstone collieries. In the evening there was a conversazione and reception by the Lord Mayor and the Lady Mayoress in the Town Hall.

The Microscope in the Steel Industry.

On Wednesday the reading and discussion of papers was resumed in the Town Hall, Manchester. Mr. C. H. Ridsdale, F.I.C., F.C.S., read a paper on "Practical Microscopic Analysis for Use in the Steel Industries." He said that there was no such thing as a "best for all purposes" steel. It was impossible that a steel should be the very best for welding, and at the same time the best for forgings, or for electrical conductivity and for turning purposes. It would be to the benefit of both user and maker if the fullest particulars were always given as to the ultimate purpose and the treatment the material would have to undergo in the intermediate processes. Microscopic examination brought out clearly the vital fact that whilst at a blue heat steel was in a condition of peculiar receptivity or sensitiveness to retain in permanent form the effects of shock or work such as strains and cracks, yet distortion strains existed in all worked material at the time of working, but when worked hot they were dissipated by slow cooling, and were in most cases more or less fixed by chilling. The author went largely into the details of microscopic analysis, illustrated by plates and photographs of steel at various heats.

Pig Iron Fractures.

Mr. James Willard Miller's paper dealt with "Pig Iron Fractures and their Value in Foundry Practice." The author stated that the method of grading pig iron originated in Great Britain several hundred years ago. The art founded 240 years ago had not progressed much beyond its original lines. In the author's opinion the fracture of pig iron was a delusion and a snare, as there was not one man in ten who could distinguish by the fracture a pig of iron suited for car wheels from one fit for stove plates. The sooner grading by fracture was abandoned the better for all concerned. Chemical composition was the only true guide by which iron could be judged as to its quality and fitness for the purpose in hand. The greatest drawback to the practical application of chemistry in the foundry was that with iron cast in the sand in the ordinary way it was almost impossible to get specimens of uniform composition. But this difficulty would be entirely overcome when the old method of casting in sand beds, which had been but little improved since first adopted, is superseded by the more economical and rational method of mechanical handling.

The Chemistry of Iron.

The Institute then proceeded to consider a paper by Dr. A. Stansfield, the object of which was to show that carburised iron is when fluid a solution of carbon of iron, and that under certain conditions the solidified mass also forms a solid solution. Further, that these liquid and solid solutions obey the ordinary laws of solution which have been fully studied in the case of aqueous saline and organic solutions. The solution theory, therefore, he held, could be invoked to explain both the mode of solidification of carburised iron and the molecular changes that take place after solidification.

Steel in Relation to Heat.

Mr. Bennett Brough, Secretary of the Institute, then read a paper by Mr. A. Sauveur, of Boston, U.S.A., on "The Relation between the Structure of Steel and its Thermal and Mechanical Treatment." He said it had been conclusively shown that in the case of finished pieces of unhardened steel the smaller the grains of the metal the more ductile and tough it would be, and as the finest possible structure resulted from heating the metal about 30deg. above the point of recalescence, it was naturally to be inferred that every piece of finished unhardened steel, in order to be in the best possible condition, should be heated to that degree. For numerous reasons, however, such treatment could not always be applied, and the problem was further greatly complicated by the fact that thick pieces could not be furnished at a temperature uniform throughout, the differences of temperature between the central portions and the outside increasing rapidly with the cross-section of the piece. Uniformity of structure, and therefore of physical properties in all parts of a worked piece of steel, together with freedom from distortion caused by cold work, could only be secured by reheating throughout to the temperature indicated, and whilst such treatment, as already indicated, was impracticable in many cases, besides necessitating the use of pyrometers, it remained true that with a clear understanding of the effect of heat treatment and of the work upon the structure of the metal, each manufacturer had it in his power to improve the quality of his product. In the manufacture of costly pieces of steel, when a large output necessitating the highest possible speed of production was not the all-important and absorbing factor—in the production of armour-plate, for instance, and expensive forgings—the metal might be treated on scientific lines, and thus the highest efficiency would be secured.—A paper on

"The Construction of Steel,"

by Professor Campbell, of Ann Arbor, Michigan, was the last to be read. The author contended that steel must be regarded as a porous body, through the pores of which a liquid might be made to filter, provided the cohesion of the liquid is not too great. Oxysulphide of iron was such a mobile liquid that it would enter the pores of the steel and filter through, assisted only by capillary attraction. The results obtained by Professor Arnold showed that the passage of phosphides through steel was a case of true diffusion rather than a case of filtration, as with the sulphides. Dealing with the carbon, Professor Campbell held that the carbon formed with the iron a series of compounds which might properly be termed "ferro carbons," on account of their similarity in structure to hydro-carbons, and he stated that if further experiments succeeded in establishing the existence of "ferro carbons," it was proposed to take up the study of some of the other carbides in order to determine whether or not other series exist. In the afternoon the members visited the Manchester Ship Canal works and other places of interest in the locality.

On Thursday a visit was paid to Oldham, where the extensive engineering works of Messrs. Platt Brothers and Co. and Messrs. Lees and Co. were inspected. A visit was also paid by members of another party to the boiler works of Messrs. Galloway, Limited. On Friday the programme of the annual meetings was brought to a conclusion by a visit to Chatsford House, by invitation of the Duke of Devonshire.

The New Waterworks at Wishaw are estimated to cost close on £100,000, and satisfactory progress is being made with their erection.

Bricks and Mortar.

APHORISM FOR THE WEEK.

"There must be work done by the arms, or none of us would live; and work done by the brains, or the life would not be worth having. And the same men cannot do both."—JOHN RUSKIN.

Parish Church, Heswell, Cheshire.

THE old church shown in our inset plate had long been with the exception of the nave and tower, in a state of serious dilapidation, until it was restored and partially rebuilt in 1879. The south chancel aisle was built at a later date in 1896 by Thomas Brocklebank and Petrina his wife, in memory of their daughter and the late Ralph Brocklebank. The chapel is built entirely of the Heswell red sandstone inside and out, the walls being very thick, giving a girth of over 6ft. to the jamb moulds of the windows. The roof is of oak, and the screen between the chancel and the chapel is of stone. The fittings are entirely of oak. The stained glass is the work of Mr. Kemp, as is also an elaborate iron screen. The brass work and hanging lamp of brass are by Messrs. Barkentin and Krall. The reredos is a very fine piece of oak work, the altar frontals being of Spanish silk needlework, and the picture of our Saviour in the reredos was painted by an old Italian master. The work has naturally been very costly and adds very much to the general effect from the body of the church. When this Brocklebank Memorial Chapel was built, the chancel was extended some 10ft., and since that time the vestries have been enlarged. Mr. J. Francis Doyle, of Liverpool, was the architect, and Messrs. John Thomas and Sons were the builders.

Jerry-Building.

JERRY-BUILDING is an evil which is not yet quite dead, and there is still occasion for vigilance on the part of municipal authorities and their surveyors. The jerry-builder who was such an adept at arranging that the drainage of a house should be as defective as it possibly could, using mud instead of mortar and broken bricks from some old building instead of new, is almost a being of the past. But still there are some builders left who put up houses in which shortly after their erection cracks from basement to roof and bulging walls may be seen, and evidences of the sinking of the foundations may also be observed. What can be done to entirely extinguish the species? The Yardley District Council has hit upon about the only effectual remedy. Whenever jerry-building of a flagrant character is proved, orders are issued for the destruction of the offending structure by house-breakers. This is drastic, but not too severe when the harm resulting from such buildings is considered.

Proposed Electric Lighting at St. Paul's.

IT WAS announced some time ago that an American gentleman, named Mr. Pierpoint Morgan, had offered to bear the expense (about £5,000) of equipping St. Paul's Cathedral with electric lighting, and that this offer was accepted. Since this announcement was made little has been heard of the proposal. The "Daily Chronicle" says that three things have happened. Firstly, experiments have been made with the electric light resulting not at all in its favour so far as St. Paul's is concerned; secondly, the Hooley presentation Communion plate has had to be paid for; and thirdly, the scheme of decoration adopted by the Dean and Chapter on the advice of Sir W. B. Richmond makes illumination by the electric light an artistic impossibility. The experiments, it should be explained, were conducted two or three years ago, before the decorations had reached their present egregious extent. Even then it was seen that the florid mosaics and gilt marking would not bear electric illumination if it were desired to maintain the massive, dignified lines of Sir Christopher Wren's great monument. The first and third objections we can understand, as there can be no doubt that the installation of electric light would throw into hideous prominence the gilded mosaics of the choir and dome; but we cannot see how the fact that the Hooley presentation Communion plate has yet to be paid for would interfere with the electric lighting installation if the money for it is to come from outside sources.

The Demolition of Woodlands, Bradford.

WOODLANDS has for some years been one of the most conspicuous landmarks of the north-west of Bradford, and its disappearance will be regretted by the residents in its neighbourhood. The house was built in 1886, from the plans of Messrs. Milnes and France, of Bradford, in the plain Gothic style then popular. The ground plan of the building is of an irregular "L" shape, the principal frontage, facing the south, having a length of 130ft., whilst the other arm of the "L," facing the east, but protected against high winds by some fine trees, has about the same length. The gates are fine examples of ornamental ironwork by Messrs. Skidmore, of Coventry. The estate, which consists of about thirty acres, will probably be offered for building lots.

A Remarkable Monument.

AMERICA has always been famous for its tall buildings and its tall tales. The city of Detroit now intends to build a statue 250ft. high in celebration of the bi-centenary of its existence. Cadillac, the founder of the city, is to be the subject of the statue. It is to be erected on Belle Isle, a small island in the lake just outside the city, and will really be a great building in the shape of a man. The feet and legs of this huge statue will be large enough to permit of several public entrances being built in them, and of the running of a number of passenger lifts.

A Question of Light.

AT last week's sitting of the Consistory Court of London, the rector and churchwardens of St. George's Church, Bloomsbury, petitioned Dr. Tristram, Q.C., Chancellor of the Diocese of London, for a faculty to sanction an agreement between them and Mr. Truslove, the owner of a building adjoining the church, in reference to the light admitted to the church through the windows on one of its sides, which light, they contended, would be somewhat interfered with by a new hotel which Mr. Truslove proposes to build. Mr. Truslove did not think the new building would diminish the light admitted to the church. He, however, had met the rector in an amicable spirit, and agreed that white glazed bricks should be used for the wall of the new hotel facing the church, and was willing to pay a rent of £1 a year for the use of the light, and to give £1,250 to be invested for the increase of the stipend of the rector and his successors. The Chancellor was satisfied that the agreement was a very fair one, and said he would sanction it by faculty.

The Temporary Bridge at Kew.

SOME time ago the openings for traffic under the temporary bridge at Kew had to be made wider. The result has been far from satisfactory. The central opening, instead of coinciding with the deep channel, is upon one side of it. The result of this was seen the other day, when a shoal pushed its head above water almost in the centre of the fairway from the main opening at low tide. The *Cardinal Wolsey* and the *Queen Elizabeth* were lying side by side for two or three hours opposite Kew, before they could proceed on their way to Hampton Court. The tug owners on the river say that the set of the currents induced by the peculiar construction of the bridge, when the flood water is coming down in the winter, will be such as to render it exceedingly dangerous to take barges through the bridge, and they may possibly be compelled to decline to take the risks. The designing of river bridges seems to be a difficult matter. River navigation does not appear to be one of the strong points of bridge architects. It will be remembered that some time ago the discussion of the merits of the design for Vauxhall Bridge caused a certain member of the Council of the Institute to exhibit what he thought was a better design. He was evidently not versed in the rules of river navigation, as he placed the bridge lamps over the piers instead of over the centre of the arches. The top of the piers of a bridge certainly seems the most natural place for the lamp, but if this was done only in one case and not in all cases, river travellers would have to remember which bridge was so adorned, so as to avoid colliding with the bases of the piers. The lamps are placed over the centres of the arches to serve as a guide to steer for.

The National Physical Laboratory.

THE realisation of the scheme for the establishment of a National Physical Laboratory is primarily due to two addresses delivered before the British Association in 1891 and 1895 by Professor Oliver Lodge, and the late Sir Douglas Galton respectively. A committee, of which Lord Rayleigh was chairman, was then appointed by the Treasury, and, after taking evidence, reported in favour of the establishment of a public institution for standardising and verifying instruments, for testing materials, and for the determination of physical constants. They further recommended that the institution should be established by extending the Kew Observatory in the Old Deer Park, Richmond, and that the Royal Society should be invited to control it and to nominate a governing body, on which commercial interests should be represented, the choice of the members of such body not being confined to Fellows of the Society. These recommendations were approved, and to give effect to them the Government undertook to ask Parliament for £12,000 for buildings, and for £4,000 a year.

The Hands that Control.

THE ultimate control of the National Physical Laboratory is placed in the hands of the Royal Society, but the constitution of the bodies which manage it directly can only be altered with the consent of the Treasury. These are an executive committee and a general board. The latter is a relatively large body, to which the executive committee must report annually, and to which it must submit its scheme of work for the next year. An essential feature in the constitution of the general board is that twelve of its members are nominated by six of the great technical societies—viz., the Institutions of Civil, Mechanical, Electrical, and Naval Engineers, the Iron and Steel Institute, and the Society of Chemical Industry. Six of these representatives of "commercial interests" are also to be members of the executive committee, which will ultimately consist of twelve ordinary and five official members, of whom the latter are the president of the Royal Society, the chairman of the committee, the Permanent Secretary of the Board of Trade, and the treasurer and one of the secretaries of the Royal Society. In the first instance, six members of the existing Kew Observatory Committee will also have seats on the executive committee, but their places will not be filled up when their period of office expires. Finally, it is in the power of the executive committee to appoint sub-committees to superintend particular departments or investigations. The members of these sub-committees need not necessarily be members either of the general board or of the executive committee.

Church Improvement at Arbroath.

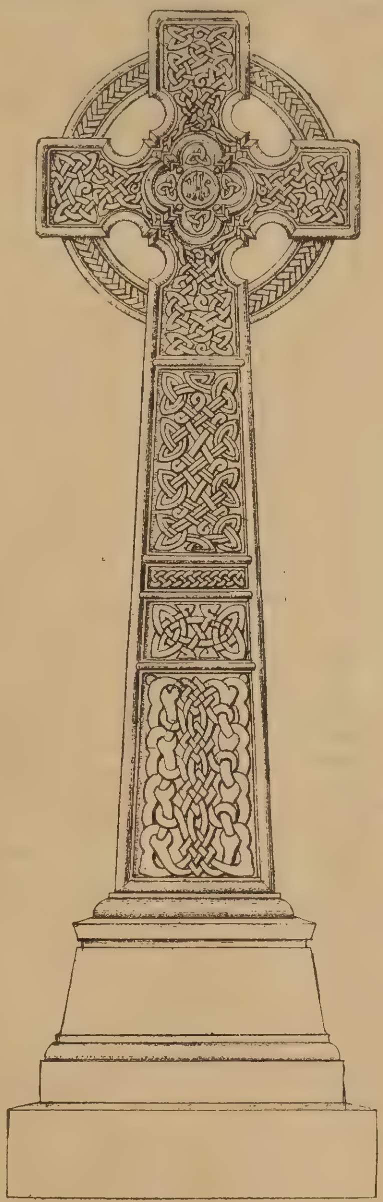
THE High Street Free Church, Arbroath, has undergone a considerable change during the last few weeks. Its walls were somewhat dark and dingy before they were put into the hands of Mr. A. C. Dargie's workmen; especially was the chancel recess in a bad state. The chancel has been artistically painted in an admirable design. The back wall is divided into three panels of reddish-brown, with ornamental bands above, underneath which it is intended to inscribe appropriate texts. The arches and mouldings and the four pilasters of the chancel have been done in a fine tone of light grey, while the upper walls of the chancel proper and the arches are of a pale bluish green; underneath the white mouldings the prevailing colour is dark blue green, relieved at the top and immediately under the mouldings with an ornamental band. The side walls of the church and the end wall above and below the gallery are done in pale yellow and light green, with a buff frieze under the cornice. The ceiling has been painted in pale buff and coloured cream, while a thread of red runs through and relieves the cornice. The gaslight reflectors in the roof have been painted white, with effective gilt edging. The front of the gallery is in yellow-brown, and unrelieved by ornamentation, while the lobby has been done in warm buff colour. The lobby floor has been laid with ornamental tiles, and one of the stone arches at the side of the church outside has been renewed, while the entrance outside doors have also been renewed.

St. George's Church, Liverpool. ST. George's Church, at the top of Lord-street, Liverpool, is undergoing demolition, and the workmen have just come upon a curious relic of bye-gone days. The church stands on the site of a baronial castle said to have been first built by Roger de Poictiers in 1073. After being used for various purposes, the castle was demolished early last century to make room for the church. While at work last Tuesday week the demolishers of the church came upon a large slab in the east aisle, immediately under the stained-glass window facing Lord Street. The slab on being raised disclosed twelve steps cut in rock and leading to a platform, and an arched doorway led to a flight of five steps, at the foot of which was a square chamber about 14ft. in height, also cut in the rock. From this place there is a passage apparently running in the direction of the river, while marks on the walls suggested that the tide flowed in at high-water, though the church is on a high level, and nearly 200yds. from the river. It is supposed that these steps and passages were hewn in the rock to provide an outlet from the castle near the waterside, and that when the castle was removed it was thought easier to cover the entrance than to fill up the passages. Foul air prevented the workmen from exploring further.

Wren's Alcove. Now that Kensington Palace has been restored, why should not the alcove which used to stand in the gardens, facing the south front of the Palace, be brought back to its original position? The alcove is a fine specimen of the stately architectural decoration of gardens which prevailed in the time of Queen Anne. At present it stands by the broad walk between the fountains and Bayswater Road. It is of red brick and stone, ornamented with Corinthian pilasters, and surmounted by a heavy pediment. The keystone bears the cypher of Queen Anne, and the structure is believed to be the work of Sir Christopher Wren. It would certainly look better in its true position, which is in the Dial Walk, the broad road which runs from the Palace to Kensington Gore.

Light. THE "Westminster Gazette" contained the other day an interesting little paragraph on the lighting of a room. It stated that although windows and open doors are, of course, chiefly responsible for the amount of light in a room, holes in the floor and ceiling may be safely depended upon to contribute their quota thereto as well. A good deal, however, depends upon the colour of the paper or other material selected for covering the walls. This, according to the percentage of light reflected thereby, will add to or detract from the darkness of a room in certain fixed proportions. The following table of the different percentages of light reflected by the materials chiefly in use for painting or covering walls is gathered from the results of recent experiments on the subject by scientists: Mirror, 92·3; white paint, 70; orange, 54·8; light green, 46·5; light yellow, 40; blue, 30; dark yellow, 20; light red, 16·2; dark green, 10·1; dark blue, 6·5; black paper, 4·5; black cloth, 1·2; and black velvet, 0·4.

Design for Celtic Cross. THE design here illustrated is original, and may be called a modern adaptation of the ancient Celtic crosses to be found in different parts of Ireland, Scotland, Isle of Man, Iona, &c.



DESIGN FOR CELTIC CROSS. BY. T. W. AYDON, LEEDS.

This particular kind of ornamentation is without question of Irish origin, and distinct from all other styles of art in the civilised world; it was probably first used in the illumination of books, manuscripts, &c., and afterwards to carving in relief. According to reliable authorities, it was established and cultivated in Ireland from the fifth to the ninth centuries. Very few rules or principles are laid down for the guidance of artists in the making of patterns, anything that lends itself to interlacing being taken and adapted to suit the taste or fancy; ribbons, reptiles, birds, animals, hideously elongated and attentuated, and interlaced; fruit, flowers, and figures; sacred symbols and monograms are all admissible, and may by the ingenuity of the artist be formed in the most beautiful patterns of interlaced work. Instances are in existence which show clearly by a magnifying glass nearly 200 perfect interlacings of ribbon pattern in the space of one-quarter of an inch superficial. The design here given is a very beautiful example of this special class of cemetery memorials. It is the work of Mr. T. W. Aydon, who has for many years given special study to such work.

Another Street-Cleaning Animal. IT will be remembered that in our issue of last week we gave some particulars of a machine in the shape of an elephant which was being tested for street cleaning purposes in Chicago. We foretold then that if the fashion spreads the streets of many of our great cities will resemble peripatetic zoological gardens, or parts of a circus parade. It seems likely that this will happen, as the latest American invention is a machine called the "electric goat." It is stated that it will carry away the rubbish that collects in the streets by means of "arms," which reach out and take up whatever comes within their grasp. We are waiting for the next animal machine; perhaps it will be the window-cleaning giraffe we suggested last week.

More Discoveries at the Tower. THE Tower of London is proving to be as fruitful in relics as the Forum at Rome, and recent discoveries have been supplemented during the last few days by others that are second only in interest to the relics supposed to belong to the period of Wyatt's rebellion. By the removal of a Georgian deal chimney-piece from one of the bedrooms in the Queen's House a beautiful specimen of a chimney-piece of the Tudor period has been exposed to view. The structure is of Gatton stone, and bears a number of inscriptions, most of which are, unfortunately, so defaced as to be almost illegible. The only word that can be easily deciphered is "Alpha." It is possible that these inscriptions might throw considerable light upon the history of the building. One of the walls of the apartment has been stripped of its plaster, and the old oak laths, crossing each other at regular intervals and closely bound together with straw, afford a good illustration of the art of the early builder. The initials and inscriptions, such as "Nosce te Ipsum," "Respice Finem," and "Oliver," that have been observed recently on the walls of Princess Elizabeth's walk, are also interesting. In connection with the most startling discovery, viz., that of the subterranean passage and dungeon, however, nothing further has yet been ascertained.

Artistic Honours in France. THE following have been created officers of the Legion of Honour: M. Raphael Collin, one of the finest artists of the French school; and M. Guadet, inspector-general of civil buildings, professor at the School of Fine Arts, architect to the Government, who was made Chevalier in 1878. M. Guadet took the Grand Prix de Rome in 1864, and a medal at the Salon of 1870. He obtained a gold medal at the Universal Exhibition in Paris in 1889, and during his brilliant career has exclusively devoted himself to the duties of Government architect. He was, in this respect, as first under-inspector of the New Opera, the collaborator of Charles Garnier, and he has successfully acted as architect on the Post Offices and the Palais Royal. In 1895 he was nominated inspector-general of civil buildings and of national palaces. The following have been made Chevaliers of the Legion of Honour: M. Agache, a painter who obtained a medal in 1885, silver medal at the exhibition in 1889, and is a member of the delegation of the National Society of the Fine Arts; M. Théodore Rivière, a sculptor, who obtained honourable mention in 1885, and medals in 1894 and 1895; M. Patricot, an engraver, who obtained the Prix de Rome in 1886, and medal of honour in 1898; and M. Vigneron, Commissionare Général of the Society of French Artists. M. Faure-Dujarrie, architect, has been made Officer of the Legion of Honour. He is the inspector of the sanitary services under the Minister of the Interior. He has been for a long time architect of civil buildings, and in this way has erected the School of Bridges and Roads and the School of Oriental Languages.

Professional Practice.

Bordesley, Birmingham.—The Imperial Theatre, in the High Street, at the corner of Clyde Street, will be opened on Oct. 2. The theatre has been designed by Messrs. Owen and Ward, Birmingham, and over £20,000 is being spent upon its erection. A façade, with turrets at either side of the building, fronts High Street on a site close to Bordesley Station. The frontage is 104ft. in height, and the elevation in Clyde Street 134ft. The High Street elevation is of red Ruabon brick with ornamental terra-cotta dressings, with a central figure representing "Liberty." The large hall is domed, and will be decorated by hand-painted panels illustrative of Shakespeare's works; the walls will be decorated with many colours, and the floor laid with mosaic marble tiles. The auditorium is divided into orchestra and pit stalls, pit, dress-circle, balcony, and gallery, and six private boxes, and the seating accommodation will be for 2,500 persons. The stage, which is on the most approved plan, and contains the most modern arrangements, is 69ft. by 40ft., a space in which the most elaborate productions can be properly presented. The scope allowed for scenic effects will be understood when it is stated that the "gridiron" is 50ft. from the level of the stage. Accommodation is provided for the artistes. There will be a commodious green room and ample dressing rooms, and other compartments will include large saloons, a cloak room, &c. Gas and electricity will be used in the lighting and warming of the building. Particular attention is being paid to the interior decorations, which will be principally in the Renaissance style, with the predominating colours of cream, blue and gold. An ornamental and glass verandah will be added to the front.

Felixstowe.—The foundation stone of the new Presbyterian Church to be erected at the corner of Orwell-road and Tomline-road was laid last week by Mrs. Lewis, Ph.D., of Cambridge. The exterior of the building will be of grey Kentish rag-stone with dressings of Bath stone. The prominent feature will be the south front, towards the main thoroughfare of the Orwell-road. A double-arched entrance porch, and a large window above, with traceried head, are grouped beneath a bold arched recess, which springs from the base to an imposing height, while other details are a turret (forming the entrance to the gallery) and massive buttresses. The side walls are arched over from buttress to buttress, each of the spaces between being pierced by three lancet-light windows. From the open entrance, draught-preventing lobbies give access to each aisle; on one side provision is made for a cloak-room, and the interior plan of the building is described as of the open area type, with transepts. The roof, which is to be spanned by moulded hammer-beam principals, with plaster between the rafters, after the old style, forms a prominent feature in the plan, the double purposes of utility and ornament having received careful consideration. There will be a gallery above the vestibule, this gallery being divided from the rest of the church by a bold arch, and the north end of the church will terminate in a short chancel, which is also to be arched over. The interior will be furnished with oak benches, and will provide seats for about 450 persons. The cost of the new church is estimated at about £3,300. The contractor for carrying out the work is Mr. F. C. Thurman, of Walton, and the mason is Mrs. Thomas Strong, one of a family who has been engaged in this special form of work ever since St. Paul's Cathedral was built. The architect is Mr. George W. Leighton, of Felixstowe and Ipswich.

The new chancel of the church of St. John and St. Felix was formally consecrated by the Lord Bishop of Norwich last Wednesday morning. Several other additions were also consecrated. The additions comprise a chancel, a south chapel, which is dedicated to St. Felix, two vestries on the north side, and an organ chamber above, approached by a special staircase from the choir vestry. The east end is throughout a replica of the east end of the church at Great Carlton, Lincolnshire. The reredos reveals a picture of the Lord's Supper, which is finely wrought in mosaic, and the representation is set in a massive framework of ornamental alabaster. On either side there is a large panel of green Irish marble, above this being more ornamental panels of glass mosaic, and in the space between the two is the text, "Peace I leave with you, My peace I give unto you." The lighting is by means of a three-light decorated window, and an excellent effect is produced on each side, by panel windows, which will in future be filled in with glass mosaics. The mosaic work above the altar table is by Messrs. J. Powell, of Whitefriars, London, and the floor of the chancel has been laid by the Rush Vitreous Mosaic Company, of Lambeth. The side chapel is lighted by a window at the east end, which is the gift of the local Lodge of Freemasons. It contains figures of three East Anglian Saints, St. Felix being in the centre, with St. Fursey—the building monk, whose emblem is a model church—on the right side, and St. Edmund on the left.

Govan.—A new school, situated in Katharine Drive, was opened by the Rev. Mr. Smith last Friday. The main entrance of the school buildings faces Katharine Drive, with Hutton Drive on the east, and an unnamed public street on the west. The main building is three storeys high, built of Corncockle stone, and is designed in the Roman classic style in an exceedingly plain but dignified manner. The face of the walls between the window dressings and the rustic corners and cornices is treated with red rock ashlar, over which the roof projects, and is supported by moulded consoles. There are three separate entrances to a large well-lighted central hall, around which there are wide balconies on each floor, with stairs at either end giving access to the several classrooms, of which there are twenty-one, with accommodation for 1,322 scholars. The windows are aptly arranged so as to diffuse the light equally over every part of the rooms. The playgrounds, in which are large covered playsheds, are laid with granolithic. In connection with the school there is a manual instruction workshop, with steam power, as also a cookery room, washing-house and laundry, with all the most modern appliances. The buildings, which were began in March, 1898, are from designs by Messrs. Bruce and Hay, architects, 261, West George Street, Glasgow, the measurers being Messrs. Dansken and Purdie, 241, West George Street, and have been erected under the superintendence of Mr. Samuel Preston, master of works to the Board. Mr. Roddie acted as clerk of works.

Great Easton, Essex.—The Bishop of Colchester recently officiated at the re-opening, after partial restoration of the building, of St. John's Church, Great Easton, near Dunmow, Essex. The portion completed comprises an entirely new dicular stone chancel arch, with a cambered oak rood-beam. The rood, which is supported by the beam, is 9ft. high, richly brattished, and with four panels for the reception of emblems. On the face of the beam are the words, in letters of gold, "God so loved the world." There are also a richly-carved oak altar with painted panels, a new stone font, brass lectern, and oak choir stalls. The work has been executed from the designs and drawings of the architect, Mr. Richard Creed, of Finsbury-circus, London, E.C., by Messrs. Bell and Sons, Saffron Waldron. The modelling and carving were done from the architect's drawings and under his immediate supervision by Mr. Henry King, Mr. Gilbert Seale, and Mr. William Butler. The cost of the work done is £900, of which £340 is still owing, and a sum of about £1,000 is needed for completing the restoration.

New Buildings at Tooting.—Two blocks of four flats each are to be erected at Tooting from the designs by Mr. Theobald, of 26, Budge Row, E.C.

Keystones.

A New Theatre at Norwich is to be constructed according to plans by Mr. Ernest Runtz, of 10, 11 and 12, Walbrook, E.C.

A New Girls' School at Swaffham is to be erected from plans prepared by Messrs. Milne and Hall, of 77, Chancery Lane, W.C.

Lodge Moor Fever Hospital Extensions are to be carried out by Messrs. John Eshelby and Son, of Sheffield, whose tender for the work was £68,750.

The New Market Hall at Ilfracombe is to be erected at a cost of about £4,600. The plans, estimates and specifications were passed at a meeting of the District Council last Thursday.

South Lambeth Orphanage to be Enlarged.—The London and South-Western Railway Servants' Orphanage, South Lambeth, is to be enlarged, at a cost of £3,000, so as to enable nearly fifty more boys to be received.

New Buildings at Stratford.—New buildings are in course of erection at Stratford for the Forest and Victoria Laundry Company. The architect is Mr. Henry Poston, of 39, Lombard Street, E.C.

Mr. W. Ernest Havell, of 23, Moorgate Street, E.C., is the architect under whose supervision extensive alterations are being carried out at the residence of Mr. J. H. Lile, C.C., at 57, Russell Square, W.C.

A New Depot for the London Parcel Delivery Company is to be erected at Forest Gate from designs by Mr. Henry Poston, of 39, Lombard Street, E.C. He has also designed new stables for the Fulham depôt of the Company.

St. Paul's Schools, Walworth, S.E., are being renovated and altered at a cost of about £2,700, from designs by Mr. P. A. Robson, of Palace Chambers, 9, Bridge Street, Westminster, S.W. Messrs. Garrett and Son are the builders.

New Schools at Clapham.—A new boys', girls' and infants' school is to be erected at St. John's, Clapham Rise, at a cost of about £2,500, by Messrs. Garrett and Son, from plans by Mr. P. A. Robson, of Palace Chambers, 9, Bridge Street, Westminster, S.W.

Public Schemes at Burnley.—A Local Government Board inspector held an inquiry at Burnley last Thursday into the proposals of the town council to expend £6,000 in erecting cold-air stores and ice-making plant, and £4,100 for various small street improvements, chiefly the widening of narrow portions of thoroughfares.

The Baths Committee of the Kidderminster Town Council have been instructed to go into the question of providing additional public bathing accommodation, which is urgently needed, and to bring up a report to the Council as to the accommodation to be provided at the proposed new baths, their estimated cost, the estimated cost of maintenance, &c.

Mr. William Simpson, R.I., who died on Thursday last, was one of the earliest special artist correspondents of the London illustrated Press. Born in Glasgow on October 28th, 1823, he was educated at Perth and Glasgow, being destined to follow the architectural profession. He, however, early turned from the pursuit of architecture to that of art, sketching and painting whenever opportunities occurred, and eventually settled on lithography as his vocation.

Samlesbury Church, Lancashire, is being Restored under the direction of Mr. James Berwistle, architect, of Blackburn. The restoration consists of re-roofing the church, filling in the old oak skeleton panels with oak boards, building two new porches, and erecting a tower at the north-west corner of the north aisle. A peal of eight bells will be hung, made by Messrs. Taylor, of Loughborough. The oak work is by Messrs. James Hatch and Sons, of Lancaster; and the building contract has been let to Mr. John Knowles, of Darwen.

The New School at Bannockburn, which has just been opened, has cost £3,400, and will accommodate 368 scholars. Mr. Ronald Walker is the architect.

A New Wesleyan Church for Wolverhampton, in Darlington Street, is to be erected at a cost of £10,500, from plans by Mr. Arthur Marshall, of Nottingham.

A New Wesleyan Chapel at Walsall is being erected at a cost of about £6,550. It is to seat 710 persons. The memorial stones were laid last Wednesday.

The Marble Statue of Professor Huxley, which Mr. Onslow Ford is executing, is practically completed, and is to be placed in the great Central Hall of the Natural History Museum at South Kensington.

The New Grammar School at Bridlington, Yorks., is being erected by Messrs. J. Thompson and Son, of Peterborough, from plans by Messrs. Botterill, Son and Bilson, of Hull.

Improvements at the Bermondsey Town Hall are to be carried out at an estimated cost of £10,000. The Vestry is asking for tenders for the alterations and additions, so as to enable a stage licence to be obtained from the London County Council.

A New Building in Coleman Street, E.C., has been erected from plans by Mr. Ernest Flint, A.R.I.B.A., of 80, Coleman Street. The new building consists of a block of offices running back to, and having another front in, London Wall Avenue. The front to Coleman Street is of Portland stone.

The Death of Mr. W. Beckley occurred last Tuesday week from cardiac failure. Mr. Beckley had been surveyor to the Brierley Hill District Council for over thirty years, and was prominently identified with many of the most valuable public improvements at Brierley Hill during that period.

A Life-size Bust of Mr. Gladstone was unveiled recently at Penmaenmawr, by Mr. Kneeshaw. The bust, which is of bronze, was designed by Mr. Albert Toft, of Chelsea, and stands on a massive obelisk and base of polished granite. The cost of the monument was £160.

The Anniversary of the Restoration of Scarborough Parish Church has just been held. The Bishop of Hull dedicated the chancel stalls and screens, which complete the work that has been carried out by instalments during the past few years in the chancel and the sanctuary, under the direction of Mr. Hodgson Fowler, at a cost of about £12,000.

Improvements at Whitkirk Church.—The Hon. Mrs. Meynell Ingram has offered £1,000 towards the cost of alterations and improvements in the old church at Whitkirk, near Leeds. Mr. Bodley has prepared plans for a new vestry and a large extension of the chancel. The church dates from the thirteenth century.

Tablets in the Blackwall Tunnel.—Two tablets are to be placed in the Blackwall Tunnel, one in memory of the seven men who lost their lives during the construction of the tunnel, and the other to mark the spot where the great steel shield used for compressed air ceased its work after boring a distance of 3,076½ft.

Bedlington New Masonic Hall was opened last Tuesday afternoon. The building is situated at the west end of the town, and has been erected by Messrs. Beattie and Maughan, contractors, at the instance of the St. Cuthbert's Lodge. The hall is 50ft. by 22ft., and has been specially arranged for masonic functions.

The New School at Thorpe St. Andrew, the foundation stone of which was laid last Thursday, is being erected from plans by Mr. A. J. Lacey. The site, which comprises a total area of about 2,700ft., will be utilised in the following manner:—Schoolroom, 38ft. 4in. by 22ft. 4in., cloakroom, 20ft. by 23ft., and commodious offices communicating. The building, which will be capable of holding seventy-five children, is expected to be completed in about three months; it is at the rear of the old schoolroom.

The Cottage Hospital, Dromore, co. Down, is being warmed and ventilated by means of Shorland's patent Manchester grates, supplied by Messrs. E. H. Shorland and Brother, of Manchester.

New Central Offices for the Warwickshire Miners' Union were opened last Saturday at Bedworth. A great demonstration took place, in which Mr. Woods, M.P., and Mr. Pickard, M.P., took part. A resolution in favour of the Miners' Eight Hours' Bill was passed.

"Helen Faucit" Memorial.—Sir Theodore Martin, K.C B., has intimated to the vicar of Stratford-on-Avon (the Rev. G. Arbuthnot) his willingness to give £1,000 for a memorial pulpit in Shakespeare's Church in memory of Lady Martin, the Shakespearian actress known as "Helen Faucit." The offer has been accepted, and Mr. Bodley, of London, will be the architect who will furnish a design.

Ribchester Roman Camp.—Recent investigations at Ribchester by Mr. John Garstang, a young Oxford student, have resulted in the discovery of the ruins of a Roman granary. Vast quantities of barley and wheat had apparently been reduced to charcoal, and this seems to confirm the story that Ribchester was sacked and burned by northern barbarians towards the close of the Roman domination.

The Renovation of Cairnie, N.B., Free Church has been carried out under the instructions of Mr. Thomson, of Fife, Keith. The seating arrangement has been altered, the flooring and joists have been renewed in certain places, the walls have been painted, and the woodwork has been stained and varnished. Mr. Christie, of Cairnie, executed the carpentry work, and Mr. Symon, of Keith, the painting and glazing.

Street Improvements and Gasworks at Malvern.—A Local Government Board inquiry was held before Mr. H. P. Boulnois, last Tuesday week, into the application made by the Malvern Council for permission to borrow £20,000 for remodelling their gasworks and £5,490 for street improvements. There was no opposition to the application. The period of the loan for the gasworks asked is forty years, and for street improvements thirty years.

Discovery at Athens.—An interesting archæological discovery is reported from the Promontory of Sunium, now known as Cape Colonna. During the recent excavations amongst the ruins of the temple there, the thirteen marble columns of which give the place its modern name, a stone was found with an engraved inscription which shows that the temple was dedicated, not, as was commonly supposed hitherto, to Athene, but to Poseidon. It would thus correspond to the Temple of Poseidon on the Island of Ægina, which lies over against Sunium.

The New Infectious Diseases Hospital at Pontefract was the subject of a Local Government Board inquiry last Tuesday week, when Dr. R. W. Johnstone investigated an application to borrow an additional £2,500 for purposes of the joint infectious diseases hospital for Pontefract and Knottingley. The hospital is already built, but the application had been rendered necessary by the difference between the original estimate and the lowest accepted tender, which accounted for £1,700, made up chiefly of an increase in the administrative block of £400, £200 for boundary walls, £750 for increase in the price of labour and materials, &c.

Vandalism of the Fourteenth Century.—Whilst removing the old lead flat round the base of the spire of St. Cuthbert's Church, Darlington, preparatory to repairs, on Tuesday last week, there was uncovered a perfect incised foliated child's grave cover, of the thirteenth century, measuring 2ft. 9in. in length by 13½in. wide at one end, tapering to 10in. at the other, and also the remains of another grave cover of the same date, measuring 18in. across the foliations. These two stones had been used to fill up the north-east squinch of the tower. This shows there was vandalism in the fourteenth century, when the belfry stage of the tower was built, between 1360 and 1375.

Whitworth Scholarships and Exhibitions.—The Committee of Council on Education have just issued the list of successful candidates in the competition for the Whitworth Scholarships and Exhibitions, 1899. The four scholarships of £125 a year each, tenable for three years, have been won by engineers of London, and of Horton, Bradford, and by students of Langside, Glasgow, and of Oldham. For the thirty exhibitions of £50 each, tenable for one year, W. T. S. Butlin, student of Bristol, T. E. Heywood, engineering student, Cardiff, and R. B. Matthews, engineer, Swansea, are among the successful.

A Bronze Statue of the Queen has been placed in front of the main entrance of the Albert Museum, Dundee, and will be unveiled by the Duke of Connaught next Saturday. The casting of the statue weighs 6 tons 15 cwt., the height of the bronze die is 4ft. 4in., and the height of the granite pedestal 9ft. The base course measures 21ft. by 19ft., and the complete monument rests on a platform of three steps. A rich Peterhead granite, effectively treated in two styles—fine axed and dull polished—has been used for the pedestal. None of the panels have been polished, so that full value will be given to the high lights of the bronze work.

Belfast Cathedral seems now in a fair way of being built. A contract has been entered into for the building of the greater part of the nave at a cost of slightly over £19,000. This portion will give accommodation for a congregation of about 2,000 persons. The committee have power, if funds are available, to complete the nave within three years by an additional expenditure of about £7,000. What is now about to be erected represents roughly a third of the entire cathedral. The amount of contributions paid and promised comes to over £16,000. The Countess of Shaftesbury will lay the first stone of the new building on September 6th; this will be the threshold stone of the great western entrance. The cathedral is to be of the Basilican type. The complete plan includes a central dome, transepts, and a chancel. The cathedral, whose nave and aisles will be 120ft. long and 88ft. wide, with an internal height of 80ft., will accommodate 4,000 people, and will be larger than any other Irish cathedral.

The Annual Excursion of Messrs. Young and Marten's Employees on Tuesday the week before last was a very enjoyable affair. About two hundred members of the firm went to Margate by "La Marguerite," and shortly after their arrival at that breezy place sat down at the Terrace Hotel to a cold collation which had been provided by the firm. The usual toasts were proposed and suitably answered, "The Firm" being replied to at some length by Mr. E. C. Montague Edwards, who presided at the tables. During the course of his remarks, he made mention of an excellent scheme for the benefit of the employees of the firm. He said a workman sooner or later reaches what may be termed his commercial value, *i.e.,* he reaches the highest wage that the firm can pay him, nor could he possibly obtain any increment elsewhere in the trade. In order that he may augment that figure the bonus scheme will be put into operation, and if by his energy and diligence he with other employees is able to do so much good for the company that a dividend of ten per cent. can be declared upon its ordinary share capital, then he will receive five per cent. upon his wages. Say, for example, a man gets £2 per week, or £104 per year, the bonus would be £5 4s. This of course will not apply to every section of the company's employees: there are some heads of departments who are not paid by results who will have a double portion. The carmen, labourers, loaders, and those of a similar grade will also enjoy the privilege of participation, but upon a lower basis than the salesmen and heads. Naturally they will need to prove to the directorate that they have used their best endeavours in the interests of the firm. The artisans who are paid by the hour or piece work do not participate so far as we have gone at present, but those taking an ordinary weekly wage may share in this new scheme.

Correspondence.

AN OPINION ON OUR COMPETITION.

To the Editor of The Builders' Journal.

Kilmarnock.

Dear Sir,—Allow me to congratulate you on your most interesting and successful feature, "The Builders' Journal Competition," just closing in your paper.

I have followed it with pleasure, and as an entire outsider have been much struck with the (in my opinion) justness of the awards. Further, as I see suggestions are permitted in your columns, is it not possible to have a reprint of the result of this competition, giving the entire literary matter and illustrations? Such a venture, I am sure, would meet with success.—Yours truly, H. S.

[We are obliged to H. S. for his kind expressions. But as regards the suggested reprint, we do not think this is necessary, as all the numbers of the Builders' Journal containing the illustrations and letterpress referring to the competition are still obtainable. The conditions were announced in the issue for May 10th, the assessor's report appeared on July 12th, and some of the designs submitted were reproduced in the numbers dated July 5th, 12th, 19th, 26th, August 2nd and 16th. A further selection of the competitive designs will be published at short intervals.—Ed. B.J.]

The Morecambe Sewerage Scheme has been sanctioned by the Local Government Board, which has given the Council permission to borrow £62,500 for the purposes of the scheme, on condition that the sewage shall not be discharged one hour before or till one hour after high water.

Co-Operators' Festival.—A great co-operative festival was held last week at the Crystal Palace. At the concluding meeting held last Saturday the Chairman, Mr. E. Owen Greening, stated that the co-operators now number 25,000,000—a community in which there are no paupers and few dependents, and in which crime is almost unknown.

A New Court at the Royal Courts of Justice.—Arrangements have now been made and plans are in course of preparation for the creation of a new Court at the Royal Courts of Justice for the use of the additional judge of the Chancery Division, who will shortly be appointed. It was at one time thought it would be necessary to go outside the building (probably to the new Bankruptcy Court adjacent) for the purpose, but space has now been found available for the erection of a large and commodious court within the Royal Courts of Justice. The work in connection with the new court is expected to be commenced very shortly.

The Housing Question.—A great labour demonstration was held in Hyde Park last Sunday, at which the following resolution on the housing question was put from each of the ten platforms:—"That we, the organised workers demonstrating in Hyde Park, emphatically express our condemnation of the majority of the London County Council and other municipal bodies authorised by Part III. of the Housing of the Working Classes Act (1890), for neglecting to avail themselves of the powers conferred, believing that a more general exercise of those powers would have counteracted many of the evils incurred by excessive competition for house room, resulting in rack-renting, disease, and death consequent upon the overcrowded and insanitary conditions under which the workers are compelled to exist. And we further demand the immediate introduction of a Bill giving greater and more extensive powers to the various municipal authorities, in order that they may more effectually grapple with this serious and growing evil. We also demand the establishment of a Rents Court for dwelling houses on similar lines to the Land and Rent Courts of Ireland and the Highlands of Scotland."

New Companies.

Chesterfield Brick Company, Limited.

This company was registered on Aug. 4th, by Messrs. Wynne and Co., 10, New Court, Lincoln's Inn, W.C., with a capital of £3,000 in £1 shares, to acquire the business of the Inkerman Brick Co., and to carry on the business of brick and tile manufacturers, &c. The first directors (to number not less than three nor more than seven) are Messrs. J. Knowles, W. Facer, J. Burcher, and J. Ashmore. Qualification, £25. Remuneration as fixed by the company.

W. A. Millard and Company, Limited.

This company was registered on August 5th, by Messrs. Waterlow and Sons, Limited, London Wall, E.C., with a capital of £2,000 in £1 shares, to adopt an agreement with Mr. Walter A. Millard, of Leeds, for the acquisition of the business now carried on by him, and to carry on the business of joiners, builders, &c. The first directors (to number not less than two nor more than five) are Messrs. Lewis Motley (chairman) and Walter A. Millard. Qualification, £10. Remuneration as fixed by the company.

Liernur's Scandinavian Syndicate, Ltd.

This company was registered on July 4th, by Mr. J. A. Vernon, 20, Wood Vale, Forest Hill, S.E., with a capital of £1,200 in £10 shares, to acquire the benefit for Sweden, Norway, and Denmark, of an invention relating to pneumatic sewerage, and to adopt an agreement with Messrs. F. Liernur and W. P. Liernur. The first directors (to number not less than two nor more than seven) are Messrs. J. Jorgensen, W. M. Johnsen, W. P. Liernur, J. S. Wood, and R. J. White. Remuneration as fixed by the company. Registered office: 5 and 6, Bury Court, St. Mary's Axe, E.C.

Dixon and Co., Limited.

This company was registered, on Aug. 3rd, by Mr. W. H. Cate, 32, Bouverie Street, E.C., with a capital of £1,000 in £1 shares, to acquire the businesses carried on by Mr. I. R. Dixon, as the Builders' Supply Co., and Mr. I. Richmond Dixon, at Cavendish Road, West Didsbury, Lancashire, and to carry on the business of builders' merchants, builders, &c. The first directors (to number not less than three nor more than five) are Messrs. Fred Hughes, Frank L. Bentley, and Richard A. Speke. Qualification, £10. Registered office, Cavendish Road, West Didsbury, Lancashire.

Edge, Malkin and Company, Limited.

This company was registered on August 8th, by Messrs. Jordan and Sons, Limited, 120, Chancery Lane, W.C., with a capital of £35,000 in £1 shares, to acquire the business now carried on at Burslem, Staffordshire, by Messrs. William M. Edge, William S. M. Edge, and Samuel W. Dean, as Edge, Malkin and Co., and to carry on the business of china, glass, pottery, and terra-cotta manufacturers. The first directors (to number not less than three nor more than five), are Messrs. W. M. Edge, William S. M. Edge, and Samuel W. Dean. Qualification, £1,000. Remuneration as fixed by the company. Registered office: Newport Pottery, Burslem, Staffordshire.

Higher Antley Brick and Tile Company, Limited.

This company was registered on August 1st, by Messrs. Davidson and Co., 10, Old Jewry, E.C., with a capital of £50,000 in £1 shares, to adopt an agreement made by this company with Mr. W. R. Warner for the acquisition by purchase or otherwise, as a going concern, of a business with a similar title (not limited), as now and hitherto carried on at Accrington, Lancashire, and to develop and extend the same; and, generally, to carry on in all or any of their respective branches the businesses of manufacturers of and dealers in bricks, tiles, pipes, pottery, plasters, cement, gypsum, china and terra-cotta, earthenware clay, fire-clay, ceramic ware of all kinds; as quarry masters, coal owners, lime burners, paviors, and manufacturers of and dealers in artificial stone for building, paving, or other purposes; to acquire and turn to account any patents, patent rights, and inventions, real and personal property, farmers and graziers, suppliers of gas, water, and electricity, the business of a guarantee company, as company promotors, bankers, financiers, and concessionnaires, &c. The signatories (each one share) are: Messrs. P. E. Harding, C. J. Wilson, F. D. Leslie, J. A. Findley, R. M. Clarke, F. S. Pine, and R. Dowson. The first directors (of whom there are to be not less than three nor more than seven) are to be elected by the signatories. Qualification, £100. Remuneration: Chairman, £150; ordinary directors, £100 per annum each, with a percentage of the profits, divisible.

New Patents.

The following abridged description is specially drawn up for the Builders' Journal and Architectural Record *by Messrs. Hughes and Young, Patent Agents, 55 and 56, Chancery Lane, London, from whom all information relating to Patents, Designs, and Trade Marks may be obtained free of charge.*

8918. Bricks and Tiles.—Patentee: G. Dore, of East Street, Rhayder, Radnor, Wales. The front of each brick has a lip which rests on the top of the brick below it and keeps water from the joint. The ends of the bricks are bevelled and have flanges for forming butt joints on their front faces.

8786. Stays for Doors and Windows.—Patentee: W. Youlten, of Victoria Street, Westminster.—Relates to a stay for casement doors and windows. The stay is pivoted at one end to a plate secured to the casement. The other end of the stay, as the casement is closed, passes into a mortise in the hanging jamb. The casement may be fastened in any required position by a sliding bolt which is pushed into one of the holes in the stay. Nearly the whole opening between the sides of the frame of the casement is left clear with this arrangement.

8816. Floors, Ceilings.—Patentee: J. Feketehazy, of Buda Pest, Austria. Main girders constructed of concrete or cement, with metal bars and tie-rods embedded therein, are first built in between the walls or other supports. The ceiling or lower part of the floor is then constructed of cement or concrete about wire netting, and the main portion of the floor is afterwards laid on frames so as to leave a central space for heating appliances and ventilation. After the concrete of the semi-arches has set, the centering frames are removed through the central aperture, which is closed in by plates. The tensile stresses are taken up by wire netting embedded in cement, and the ceiling and any heavy objects, such as chandeliers, may be suspended from the concrete arches. Partition walls may be built on the arches or girders.

Aberdeen Graving Dock. — Aberdeen Harbour Commissioners resolved at a meeting on Monday week to authorise the engineer to take down and rebuild a portion of the north wing wall at the entrance to the graving dock, as it is in danger of collapsing. The engineer estimates the cost of the repairs at £380, and considers they will be sufficient to stand with safety until the work of reconstucting the dock necessitates the removal of the wall.

NEW ASYLUM for EAST SUSSEX.

TO CONTRACTORS.

The Visiting Committee of the proposed Asylum at Hellingly, near Hailsham, Sussex, are prepared to receive TENDERS for EXCAVATING and LEVELLING the SITE and for FOUNDATION WORKS for the New Asylum, in accordance with plans and specification prepared by their Architect, Mr. GEORGE T. HINE, F.R.I.B.A., of 35, Parliament-street, Westminster, S.W.

A copy of the specification and schedule may now be obtained from the Architect on payment to me of a deposit of £5, which will be returned on receipt of a bonâ-fide Tender.

Sealed Tenders, endorsed "Tender for New Asylum Works," to be addressed to me, the undersigned, and delivered to me on or before MONDAY, SEPTEMBER 4th next, not later than SIX p.m.

The Committee do not bind themselves to accept the lowest or any Tender.

By order,
REGINALD BLAKER,
Clerk to the Visiting Committee.
No. 211, High-street, Lewes,
August 9th, 1899.

CITY of BRISTOL.

TO BUILDERS and CONTRACTORS.

The Finance Committee of the Corporation are prepared to receive TENDERS for the ERECTION of NEW OFFICES in Broad-street, Bristol.

Drawings and specifications can be seen at this office and bills of quantities obtained on deposit of a cheque value Two Guineas, which will be refunded on receipt of a bonâ-fide Tender.

Tenders must be made out on the form provided, and all blanks must be filled in, otherwise the Tender will not be considered.

Sealed Tenders, endorsed "Tender for Offices, Broad-street," and enclosed in the envelope provided, to be delivered before TEN a.m., FRIDAY, SEPTEMBER 1st, 1899, addressed to the undersigned.

The Committee do not bind themselves to accept the lowest or any Tender.

By order,
T. H. YABBICOM, M.Inst.C.E.,
City Engineer.

COMPETITION.

COMPETITION. — ARCHITECTS and BUILDERS.

The Board of Public Works for the Island of New Providence, Bahamas, West Indies, invite Architects and others to submit DESIGNS and SPECIFICATIONS for a NEW PUBLIC MARKET, to be built of stone, brick, or iron, in the city of Nassau, New Providence, and the Board offers a premium of £40 for the design which shall appear to them to be most suitable for the purpose.

The Board will also pay £10 for the second best design, and £5 for the third best. The Board will be the sole judges as to the merits of the designs.

The design selected for the first prize shall become the property of the Board, and before the £40 will be paid, a full set of detail working drawings and specification shall be supplied by the person whose design shall be chosen.

The Board are at the same time prepared to receive TENDERS for the ERECTION of the MARKET, in accordance with any design submitted.

Full particulars and plan of the site may be had by addressing the CIVIL ENGINEER, Nassau, Bahamas, viâ New York, to whom also the designs are to be sent not later than NOVEMBER 30th, 1899.

N. GEDULD & SONS,
WHOLESALE AND RETAIL WAREHOUSE
FOR PAPERHANGINGS, PAINTS, AND GLASS.
INCANDESCENT FITTINGS
at lowest possible prices.
ELECTRICAL and GAS FITTINGS sold at 50 per cent. less than the usual prices. A large variety of Taps, Boilers, and Bath Fittings, Stop Cocks with Valve Fittings for Hot and Cold Supply, sold at Half Prices.
NOTE THE ADDRESS:—

SANITARY INSPECTORS' CONFERENCE.

FOLLOWING the meeting of the Sanitary Inspectors' Association at Lincoln on August 3rd, and the opening of the Health Exhibition, reported in our last issue, the next day, Thursday, was devoted to the reading and discussion of a number of papers. Mr. H. K. Hebb first gave an account of the last thirty-three years' work in Lincoln under the Public Health Acts. Mr. G. M. Lowe, M.D., F.R.C.P.Ed., then treated of the action of sun and air in the

Purification of Surface Water.

He stated that absolutely pure water was unknown in Nature, and one of the chief properties of water to be considered was its power as a solvent, which is exercised in reference to gases and liquids as well as to many solid substances. Rain water is a very powerful solvent of certain ingredients of the soil, such as sulphate of lime, chloride of sodium, and magnesium salts, but when saturated with carbonic acid, as is ordinarily the case, its solvent properties are remarkably increased. Certain of the mineral constituents convey to water its *hardness*; these are salts of lime and magnesia. The sulphates, chlorides and nitrates of lime and magnesia, give to water its so-called *permanent hardness*, whilst the carbonates which are held in solution by excess of carbonic acid, impart to it its *temporary hardness*, or that which it loses by boiling. Dr. Lowe went on to say that the waters of rivers, from which the greater number of English towns obtain their supplies, contain the above-named mineral constituents in quantities varying according to the composition of the soil over which they flow. All river waters contain more or less organic matter, which is acknowledged to be a predisposing cause of disease. From a sanitary point of view it is necessary to consider the source of the organic matter, the nature of the decomposition it undergoes, and the means of destroying it, so as to render the water wholesome. A river is

The Natural Drain

of the country and towns through which it flows, and the organic matter its water contains must necessarily be derived from the sewage of towns, the surface drainage of manured and cultivated lands, and the decay of aquatic plants and animals. In a non-tidal, slowly flowing river the water comes into intimate contact with the various agents that tend to purify it, sunlight, air, and vegetable growth. Direct sunlight checks the multiplication of and ultimately destroys pathogenic bacilli (such as those of typhoid, cholera, and anthrax). It favours the decomposition of dead organic matter, especially of sewage origin, by a process of oxidation, possibly by ozone or peroxide of hydrogen, or both; and aquatic plants absorb carbonic acid gas, and give off oxygen, materially assisting in purifying water. The surface of water exposed to air and sun is enormously increased by the action of wind, which breaks it into waves, the superficial area in contact with the atmosphere being increased according to the amplitude of each wave. This wonderful laboratory of Nature is subject to variations as to the output and efficiency of its work. Thus, the action of light probably ceases during the night; in very swift rivers the amount of dissolved gases, such as oxygen, is less, owing to the pressure of the current; therefore, unless the surface of such a river is broken by falls or cascades, but little oxidation can go on. When the effect of both sun and air is cut off, as in the case of prolonged frosts, the natural purification of river water ceases, sometimes with disastrous results. Laboratory experiments often fail to corroborate the "evidence of experience," and sanitary authorities are frequently perplexed and led into useless expenditure by the too positive declarations of experts, one class declaring that no river is long enough to purify itself, and others pointing to notable examples of clarification, as at Munich, where the foulest sewage disappeared after two hours flow below that city. This practice has been explained by Dr. Koch, who investigated the recent outbreak of cholera at Hamburg and Altona; he reported that the comparative immunity of the latter town, which lies lower down the river than Hamburg, whose sewage passed untreated into the stream, was due to the effective filtration of the water. It is not a chemical, but

A Biological Question.

If the specific disease-producing bacteria can be carried long distances by streams, it matters very little whether they are accompanied by an increased or decreased amount of the soluble impurities which were introduced therewith. Biologists differ as widely as chemists in their views; some contend that a biologically impure water may, by a few miles flow, supplemented by a process of sand filtration, be rendered biologically pure, whilst others consider that the water of a river specifically infected at any point cannot afterwards be rendered safe for domestic purposes. But pathogenic (or disease-producing) bacteria are in an unnatural medium in water, and whilst the natural water bacteria increase rapidly in a water contaminated by animal manure, the former undergo rapid attenuation and loss of virulence, and being worsted in the struggle for existence speedily succumb. Direct sunlight also destroys these bacteria, and even diffused light reduces their vitality. During the process of sedimentation also a large proportion of the bacteria are deposited. Dr. P. Frankland has shown that in the process of softening water by the addition of lime, 98 per cent. of these organisms are removed in the precipitate. The action of free oxygen existing in water and of the nascent oxygen produced by acquatic plant life have to be investigated.

The successful elucidation of the problems of the purification of surface waters depends on a close study of Nature's methods. A knowledge of the physical properties of water and of the effects of sunlight, air, and plant life on its organic impurities, together with a bacteriological investigation of the local peculiarities of each district, is necessary to enable sanitary authorities to work with efficiency.

Mr. T. J. Moss-Flower, C.E., F.G.S., Chairman of the Association, read a paper on the

Sources of Underground Water Supplies.

The following are some of the chief points dealt with:

Regarding the relative wholesomeness and palatability of water from various sources, it may be well to refer to the Rivers Pollution Commissioners' report, which states as follows: "In respect to wholesomeness, palatability, and general fitness for drinking and cooking, our researches lead us to the following classification of waters in the order of their excellences, and founded upon their respective sources:—

" WHOLESOME	1. Spring water ...	Very Palatable.
	2. Deep-well water ...	
" SUSPICIOUS	3. Upland surface water	Moderately Palatable.
	4. Stored rain water ...	
" DANGEROUS	5. Surface water from cultivated land ...	Palatable.
	6. River water to which sewage gains access	
	7. Shallow-well water	

A Shallow Well

is one that does not pass through an impervious stratum to a water-bearing formation beneath, but is simply sunk into a surface stratum of gravel or other pervious formation, and obtains its water by the soakage into the ground of the water which falls within a comparatively short distance of the site of the well. A well is considered to be a "shallow" one, no matter what its depth may be, provided its supply is not furnished from a water-bearing formation lying beneath one or more impervious strata. With regard to shallow wells it is hardly necessary to say much in condemnation of them as the evils connected with this source of supply are well known. The author believes, however, that there are thousands of shallow wells in existence which form the only source of water supply to many thousands of people. Possibly under a certain set of conditions, which, however, seldom exist, a shallow well might give a supply of fairly good water, but never in populated districts, and generally it is far safer to condemn them outright whatever may be the existing physical conditions. The author has made a considerable number of examinations as to the cause of the water in certain wells becoming contaminated, and he has generally been able to trace the cause of pollution to there being within a comparatively short distance of the well either one or more of the following undesirable conditions, viz.:—Defective drains, sewers, cesspools, foul ditches or privies, which allowed their contents to percolate therefrom; accumulations of manure, decaying vegetation, and improperly paved barn yards. The remedy is to carry the well to a good water-bearing stratum below one or more impervious strata, and thus convert the "shallow well" into

A Deep Well.

The millstone grit is an admirable water-bearing stratum. The water from it is generally excellent and of very moderate hardness. Magnesium limestone possesses wonderful absorbing capacity, and may be said to be a good water-bearing formation. The water from it, however, is generally very hard and is often found to contain considerable quantities of calcium sulphate. Carboniferous limestones generally yield an abundance of water. The red sandstones are very excellent water-bearing formations, and many of the towns in this country draw supplies thence. The coal measures yield water of variable quality and hardness. Considerable quantities of iron pyrites are found in these formations and give the chalybeate qualities found in water obtained from this source. The hardness ranges from over 100 degrees in some cases to as low as 3 in others. The lower oolites rapidly absorb the rainfall, and in some cases yield an abundance of water of varying degrees of hardness. Many excellent supplies of water are obtained from the chalk. It must be borne in mind that all

Sources of Fresh Water Supply

have but one common origin, that is, the moisture which falls from the clouds. The amount of rainfall depends upon situation and elevation, and the springs upon geological characters. As to what percentage of a given rainfall is evaporated, or what percentage sinks into the earth or is returned to the sea, that depends wholly upon the particular physical conditions prevailing. The portion of the water absorbed is discharged in the form of springs, or, the conditions being favourable, is held by the water-bearing formations at various depths to form extensive subterranean reservoirs, which in many cases are practically inexhaustible. As to the quantity and character of the water to be found, so much depends upon the physical conditions existing, and the whole area from whence it is proposed to obtain an underground supply must be examined in great detail. All springs with their respective levels, and the water line in existing wells, should be carefully noted. Frequent borings should be made in case of doubt. The dip of the various strata, position of faults, and other geological disturbances likely to affect the planes of saturation, must be carefully ascertained. Of course, if circumstances permit, the site of the well should be arranged at such a level as would enable the water, after being raised from the well, to be supplied to the town by gravitation. The direction of the flow of

Underground Water

must be ascertained, and care must be taken in selecting the site of the well that it is not possible for anyone else to sink another well and rob the well first made of its water. The possibility of well-water becoming polluted has already been referred to, and in selecting a site for a well great care must be taken to see that the absorbing area or areas from which the well draws its supply are free from polluting agencies. The conditions affecting underground water supplies are subject to fixed laws, and when the physical conditions existing in any particular district have been thoroughly studied, the existence of springs, their depth from the surface, and the height to which they will rise can generally be, at least approximately, determined.

In case of a supply from deep wells the annual working expenses for pumping in many cases would be no more than the interest on the extra capital sum required to procure and manage large surface supplies. Among some of the advantages of a deep well supply it may be mentioned that impounding and compensation reservoirs are unnecessary; filter beds are not required, settling tanks can be dispensed with, though they are needed if the supply be taken from a river. The first cost is often much less than a surface supply would be, and, as there is no property in underground water, it may be much easier to get Parliament to sanction a deep-well scheme if a special Act were required.

Mr. Thos. G. Dee followed with a valuable paper on "Prevention of Smoke," which we shall publish next week.

Slaughter-Houses and Slaughter-House Inspection

formed the subject of a paper by Mr. G. Anderson, Chief Sanitary Inspector for Middlesex. He contended that slaughtering should be done in commodious, well-ventilated, well-appointed public abattoirs, under municipal management, and that the small, badly-constructed and ill-ventilated private slaughter-houses should be abolished. All slaughter-houses should be well-ventilated and drained, the inner walls should be lined with glazed bricks or tiles, and the floors should be laid with cement concrete, with a proper gradient to a blood hole. As this requires emptying by hand, a small iron set-pot, let into the ground, with wood cover is the best, and no room or loft should be constructed over a slaughter-house or lair. The cattle lairs in connection with the slaughter-house should be well paved, drained and ventilated, the inner walls should be covered with hard, smooth, impervious material, and lime-washed at frequent intervals. The most important advantages the author claimed for public abattoirs were: (1) That they practically guaranteed the inhabitants of a town a pure meat supply, and abolished the trade in diseased meat; (2) That they confined the nuisances and foul emanations inseparable from the business of slaughtering to one place, instead of allowing them to be spread over different parts of a town, as at present. (3) That they would banish from crowded districts the semi-public slaughtering now taking place, often in the presence of children, a state of affairs which must have a very unwholesome effect on the juvenile mind.

Mr. J. Skinner, of Brighton, dealt with the sanitation of dairy farms. The final paper was that of Mr. W. Watkin, F.R.I.B.A., on

Domestic Sanitation.

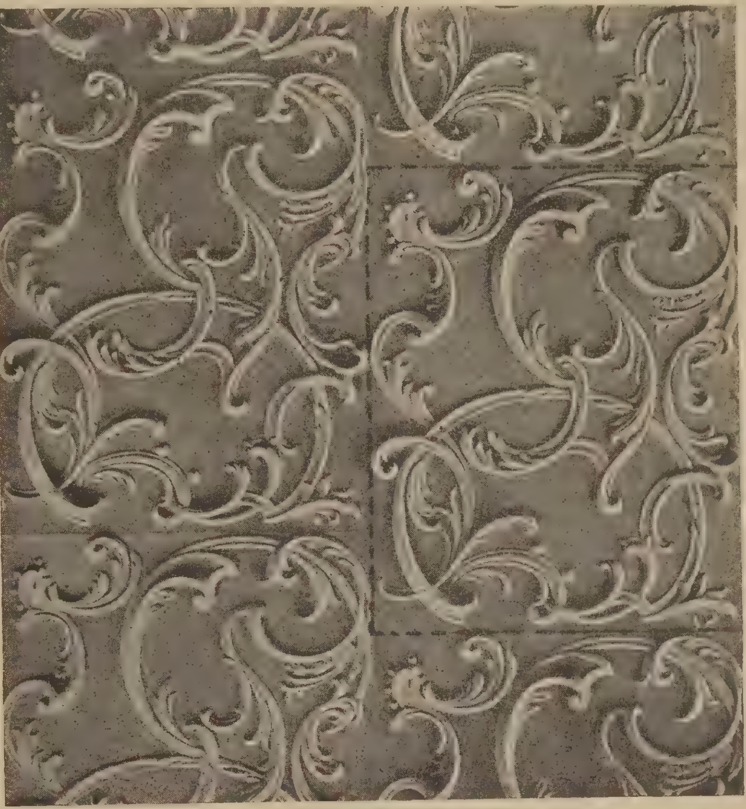
Among many fruitful causes of ill-health and disease the author mentioned that unpaved back-yards and badly-laid and leaky drains, admitting of the saturation of the soil under and around residences with polluted matter; open waste-pipes from sinks and lavatories, fouled inside with greasy matter, admitting foul air to the interior of the houses to be breathed by the unfortunate inmates; ventilating pipes from sewage drains stopped up with the falling rust of ungalvanised cast metal; unpaved pig-styes and ash-pits filled with putrifying matter, and manure-pits in a foul condition, often within a few feet of the doors and windows of the house. And if we add to these the carefully stopped-up fire-places and pasted-over ventilators of bed and sitting rooms, and the ever-to-be-condemned "dead wells" or "sewage cesspools" so persistently provided for in the building bye-laws of county and district councils, and required by them to be constructed to every house and cottage within their jurisdiction, where no system of public drainage exists, we have a catalogue of the evils the amelioration of which will tax the energies of the sanitary inspectors for many years to come. Sanitation does not begin and end with drains nor with the polluted soil under and around our houses, but extends, amongst other things, to the sanitary appliances with which buildings are fitted up. Of these, as is usual in such matters, the simplest and least complicated are the best. Each case should be treated on its own merits; and as an architect designs the main structure, so he should lay down a complete system of sanitary appliances for all buildings entrusted to his care; no pipe should be embedded in walls or ceilings, no enclosures should be permitted to sink closets, lavatory basins, or baths, and no waste-pipe should be closed against the admission of fresh air to every part of it. Not, however, until the householder recognises his responsibility and takes the trouble to find out the difference between the skilled and unskilled workman can he expect to receive immunity from the evil consequences of insanitary workmanship.

On the Friday evening the Mayor and Corporation of Lincoln were entertained by the Association.

Trade and Craft.

A SUBSTITUTE FOR MODELLED PLASTER.

A beautifully illustrated catalogue and price list of designs issued by the Cordelova Company, Ltd., of 74, Pitt Street, Edinburgh, has just come to hand. This work runs to nearly 200 pages, many of which contain several illustrations of the many patterns of Cordelova high relief ceilings, friezes, and dados, and low relief fillings, ceilings, and dados, as well as a large number of miscellaneous designs for furniture, door-panels, pilasters, pateræ, &c. The catalogue contains a unique collection of high-class ceiling designs. These designs are made in very convenient sizes for hanging. Our illustration shows an attractive design in Louis XIV. style in extra high relief. It also illustrates by means of the dotted lines how the panels are joined together without the relief parts being cut in the joining. The catalogue gives concise instructions with regard to ordering and hanging Cordelova. The prices charged for this material, more especially for effects of more than one colour or gold and colour, are much lower than the cost of employing a decorator to produce the same effects. Cordelova is easily hung. All that is necessary is that the material be trimmed with a knife and metal-edged straight-edge, and then pasted up. On most of the designs are guiding lines for trimming. For raw material ordinary paste is sufficient, and for decorated material the addition of a little Venice turpentine is advised. One length or panel should be pasted at a time and hung at once. The hanging should be done lightly, working on the ground of design only, without brush or roller. The company recommend the use of muslin, as a two-inch strip pasted on the wall or ceiling, under the joint, will effectually prevent any opening afterwards. After hanging, and when dry, reduced size should be applied; one coat for low relief, and two coats for high relief. Cordelova is one of the best substitutes for modelled plaster we have seen.



CORDELOVA: DESIGN FOR CEILINGS.

Brixham Wesleyan Church has been Enlarged at a cost of upwards of £1,000. The building has been reseated throughout with pitchpine lean-back seats. The vestry and old schoolroom at the back have been thrown into the chapel, additional accommodation for upwards of 200 persons being thus afforded. The orchestra has been enlarged to a seating capacity of thirty. The rostrum has been altered, and new exits have been made to each of the galleries. New ventilating and heating apparatus have been put in, and incandescent burners have been substituted for the old gas jets.

Messrs. Robert Boyle and Son, Limited, have received a diploma from the Ninth International Congress of Hygiene and Demography which was held in Madras last year. The diploma has been presented to the firm "in recognition of the service rendered to the public health by the introduction of their system of ventilation." The Spanish Government have employed the Boyle system of Natural Ventilation in a large number of public buildings in Spain, including the Chamber of Cortes, Government offices, barracks, forts, hospitals, &c., and Messrs. Boyle have received a number of valuable reports in respect of these buildings. Mr. Robert Boyle, during his "Sanitary Crusade" through Europe, devoted considerable attention to Spain and helped to awaken a deeper interest in that country in sanitary measures.

THE BUILDING TRADE DISPUTE.

THE Leeds Master Builders' Association held a meeting last Tuesday week at the Builders' Exchange, Leeds, to consider the terms of settlement proposed at a conference between representatives from the Yorkshire Masters' Federation and the London Order of Bricklayers, held on last August Bank Holiday. The terms proposed were as follow:—1. Bricklaying wages to be advanced from 9d. to 9½d. per hour. 2. That there be one apprentice to three bricklayers, and the limit to be six. That they be legally bound for not less than five years, their ages to be not more than sixteen years. 3. That no builder be allowed to take an apprentice before he has been in business twelve months. 4. The apprentice rule to be considered provisional till the National Rules relating to apprentices have been settled. 5. That no strike or lock-out shall take place under any circumstances without the matter in dispute having been first brought before the Standing Committee, which shall, however, meet to discuss the matter within forty-eight hours of notice being given to the secretary, and the work in dispute shall remain in abeyance until such time as the Standing Committee have settled the matter. The Standing Committee to consist of seven employers and seven operatives.

These terms were almost unanimously accepted at a crowded meeting of the London Order of Bricklayers held the previous Saturday night. The Leeds masters, however, are opposed to any advance of wages being granted, and at the meeting last Tuesday week, over which Mr. W. Nicholson presided, the following resolution with regard to the proposed advance of wages from 9d. to 9½d. per hour was adopted: "That the recommendation of the Yorkshire Federation be not accepted." The other proposals were discussed, and it was decided to adjourn the meeting for a week, and in the meantime to submit the questions to a ballot of all the members of the association.

At a conference, last Tuesday week, between Hull master builders and men connected with the building trade, a resolution passed at a meeting on the previous Monday was read. This resolution reaffirmed the masters' determination not to give way on the question of freedom of employment. The men replied that they would not consent to the condition, and left the conference. The masters declare their intention to at once open their shops to all men willing to work. Those on strike are confident that they will force the masters to accept their terms. The employers are quite willing to give a halfpenny per hour advance, to commence on the 26th inst., but state that they will stand to the fullest extent by all men who will work for them, and that they will seek no further conference with the dissatisfied operatives.

The Yorkshire Builders' Federation met last Wednesday afternoon to consider the attitude of the workmen at Hull, and after a lengthy discussion in private it was announced that the following resolution had been unanimously adopted:—"That this meeting of the Yorkshire Builders' Federation resolves, in consequence of the action taken by Union men in Hull in refusing to work with non-Union men, to fully approve of the course adopted by the Hull Master Builders' Association, and orders them to open their shops to all men at once as Free Labour shops, and they pledge themselves to support the Hull masters to the end, financially or otherwise."

Dundee Plasterers' Labourers have come out on strike for an increase of wages. The present rate of pay is 5½d. per hour, and the demand is for an additional ½d., an advance of ¼d. having been declined. At a meeting of the strikers last Thursday, attended by about 160, it was decided to hold out for the halfpenny advance.

Builders' Notes.

An Aintree Builder's Affairs.—A meeting of the creditors of Herbert Beech, a builder, of 23, Second Avenue, Longmoor Lane, Aintree, was held last Wednesday at the offices of the Official Receiver at Liverpool. It was reported that the unsecured liabilities amounted to £811 11s. 3d. There were creditors fully secured representing £9,498 16s. 6d., and they held securities of the estimated value of £10,028 8s. 3d., leaving a surplus of £529 11s. 9d. The assets, including the surplus of securities, amounted to £839 19s. 6d., leaving an apparent surplus of assets over liabilities of £28 8s. 3d. The debtor, who was twenty-three years of age, commenced business as a joiner and builder in September 1898, in partnership with a Mr. John M'Clusky, putting in £90 of capital. The partnership was dissolved in November, 1898, the debtor taking over the assets and liabilities. The debtor alleged that the cause of his failure was inability to obtain advances. No offer was made on behalf of the debtor, and it was resolved to wind up the estate in bankruptcy. Mr. Thomas Tranter, incorporated accountant, 24, North John Street, Liverpool, was appointed trustee, with a committee of inspection.

What is a New Building?—On Friday, the 11th inst., at the Chelmsford County Session, Messrs. S. J. and W. E. Gannon, machinists, &c., of Springfield Hill, were summoned, at the instance of the Chelmsford Rural District Council, for erecting a building at Springfield without giving notice of their intention to do so and without depositing plans. Mr. Thomas Dixon, solicitor, on behalf of the Rural District Council, stated that this was a very important case to local authorities. Some years ago a building was erected by Messrs. Gannon of corrugated iron, the measurements being about 20ft. by 16ft. This erection had been added to from time to time, but then there were no by-laws affecting such a work. Since the by-laws had been in operation Messrs. Gannon had commenced the erection of another addition to the original building, constructed of corrugated iron and wood about 12ft. square. The contention of the Council was that the building was a new one within the meaning of the by-laws, and that it was necessary for plans to be deposited and notice given of the intention to build. The defendants urged that this was not "a new building," and did not come within the meaning of the by-laws, and that they were not liable to deposit plans. If a building could be added to in this way a very small building could be made into a very large one, and the character of the whole could be entirely altered. Mr. Sutthery, for the defence, said that so far as they went the authorities were in his favour. The case of James v. Wyvill laid it down that every case was to be tried upon its merits, and that it was the duty of the Bench to find as a fact whether there was a new building or not. Lord Chief Justice Coleridge, in giving judgment, said that whether it was a new building or not was a question of fact and of degree. In Shiel v. The Mayor of Sunderland, a house and stables were erected before the Local Board of Health came into existence. After that authority had been established and by-laws had been introduced, the proprietor of the premises pulled down the coachhouse and stable entirely and built them away from the house partly on the site previously occupied. A covered way was erected from the house to these premises, and the whole structure was held to be an addition to an old building, and not to be a new building. In the present case the addition was almost infinitesimal as compared with the whole structure, and did little more than fill in a corner and make the structure square. The ground had previously had deposited upon it the very things that would be placed there now, and Messrs. Gannon merely thought it was time to place a roof over these. Mr. Chas. Pertwee, architect, gave it as his opinion that the erection was not a new building, but simply an addition to an old one, to which by-law 93, under which the action had been taken, did not apply. Mr. Dixon, addressing the Bench, said the case of Shiel v. The Mayor of Sunderland was a very old one. The judgment of Lord Coleridge in reference to a case where several floors were added to the building, which was thus adapted for a new purpose—that of occupation by individuals—was much more recent, and this said: The question whether a building is a new building or not has been decided over and over again to be a question of fact; it is a question of degree. For instance, if a building were nearly all taken away and re-built it clearly would be a new building. On the other hand it is quite clear that by a small addition of, say a door, the building would not thereby become a new building. Between these two extreme cases there may be thousands of cases, and it would be impossible to give a definition in each particular case as to what is or what is not a new building.—The Chairman of the Court (Mr Thos. Kemble) announced that the Bench had had some difficulty in coming to a decision, but they had made up their minds that this was a new building coming under the by-laws. In reply to a question, Mr. Dixon said the Council did not press in any way for a vindictive fine, but merely for a moderate one for the infraction of the by-laws, and costs. A fine of 5s. was imposed, with 14s. costs. The Clerk (Mr. W. W. Duffield) observed that, according to the contention of the defendants, an old building could be added to year after year for an unlimited time. The Chairman said the Bench had recognised this.

Masters and Men.

Masons' Labourers at Dunoon struck work last Wednesday in consequence of the masters refusing to concede them an advance of ½d. per hour, or failing that a ten hours' day instead of a nine hours' one.

The Plasterers' Dispute in Manchester.—A meeting of the master builders of Manchester, Salford and district was held in Manchester last Tuesday week "to consider the position arising out of the continued dispute with the plasterers and the steps to take." The case of the local master plasterers is that the men decline to resume work unless an advance of a penny an hour—from 9d. to 10d.—is granted. They offered a halfpenny rise and another halfpenny at the end of twelve months, but the men declined these terms. It was decided to lay the matter before a general meeting of employers of the district, representing all the branches of the building industry. The meeting was private. No decision of a definite kind was arrived at, and the meeting was adjourned for a fortnight.

Compensation Claim Against Garston Engineers.—His Honour Judge Shand heard, at the Liverpool County Court on August 11th, the following claim under the Workmen's Compensation Act. Francis Sloane, a corrugated iron roofer, claimed compensation from F. Horton and Co., Ltd., engineers and contractors, Garston. The applicant stated that while he was engaged in roofing a building at Peaton Hall, Diddlesbury, being then in the employment of the respondents, the scaffold on which he was working gave way, and he fell to the ground, a distance of over 30ft. He was, he alleged, severely injured, and although the accident took place in February last he was still unable to follow his employment. Mr. Jackson, for the defendants, urged that his clients were not undertakers within the meaning of the Act, as they had only to put on the roof, and were not constructing the building. His Honour pointed out that in connection with the building in question there were two contracts, one for the construction of the walls and the other for the roof. The defendants were working under their separate contract, and, in his opinion, were undertakers. Judge Shand held that the plaintiff had made out his case, and awarded him 15s. a week from the time of the accident until he should be able to resume work.

Engineering Notes.

Members of the Institution of Junior Engineers spent last week at Portsmouth, and visited the various places of engineering interest in the vicinity.

The Wesleyan Chapel, Formby, has been fitted with the latest improved hot water heating apparatus by John King, Limited, engineers, Liverpool, who have employed their well-known "small tube" apparatus, with special economical coil heater.

American Steel for Japan.—The Pencoyd Ironworks of Philadelphia, the contractors for the Atbara Bridge, have entered into a contract with the Japanese Government to supply within a year from 8,000 to 10,000 tons of steel for bridges. The price is stated to be 750,000 dollars.

American Engines for Glasgow.—The Glasgow Corporation Tramway Committee, at their meeting in Glasgow last week, considered tenders for supplying engines for the driving power for the Glasgow electric tramways. Mr. Parshall, the Glasgow electrical engineer, strongly recommended accepting the tender of Messrs. E. P. Allis and Co., of America, who offered engines for £114,554. By seven votes to six this tender was accepted. Messrs. Harvey and Williamson, of America, tendered at £160,000; while Messrs. D. Stewart and Co. tendered at £54,800, but offered a lighter engine.

New Dock at Barrow. — The Furness Railway Company obtained Parliamentary powers in the 1899 Bill for the construction of one of the largest graving docks in the world. The dock, which will be constructed alongside the present entrance basin to the Ramsden Dock, will have an entrance 100ft. wide from Walney Channel, and a similar width of entrance into the Ramsden Dock. The dock will have 30ft. depth of water, and will be about 1,000ft. in length. Before commencing this work the Furness Railway Company are busy deepening the sill of the Ramsden Dock by 6ft., making a clear passage through all the docks for all vessels of 30ft. draught, and up to a width of 100ft. This work will take nearly twelve months to complete.

Surveying and Sanitary Notes.

Cardiff Sewerage.—Cardiff County Council have adopted the plans of the long-talked-of western sewer. The estimated expenditure is £181,000.

Street Improvements at Ramsbottom.—Colonel A. G. Durnford, R.E , inspector of the Local Government Board, held an inquiry at Ramsbottom, on Tuesday last week, into an application made by the Ramsbottom District Council to borrow £3,453 for the purposes of private street improvements. The Council asked for twenty years in which to repay the money applied for. Part of the work in some of the streets had already been done and paid for out of the rates. Mr. J. Halliwell, surveyor, submitted plans and gave details of the work to be done. There was no opposition, and after the inquiry the inspector visited the various streets.

The Sanitary Institute's Lectures and Demonstrations.—We have just received an advance proof of the prospectus of the Sanitary Institute for its twenty-eighth course of lectures and demonstrations for sanitary officers. There will be six lectures on elementary physics and chemistry, two lectures on elementary statistics, meteorology, and local physical conditions, eighteen lectures on public health statutes, orders, memoranda, and model by-laws of the Local Government Board, and the by-laws in force in the administrative County of London, the practical duties of a sanitary inspector, municipal hygiene or hygiene of communities, building construction in its sanitary relations, measurement and drawing of plans to scale, and seven lectures on meat and food inspection. The various subjects to be dealt with will be given by well-known authorities, and will be illustrated with diagrams, drawings, models, and lantern slides. The lectures will include the subjects scheduled for the examinations of the Institute and the Sanitary Inspectors' Examination Board. Further particulars of these lectures and demonstrations can be obtained on application to the Secretary at Parkes' Museum, Margaret Street, Regent Street, W.

The Congress of the Royal Institute of Public Health will be held in Blackpool from September 21st to 26th this year. The Marquis of Lorne will preside over the Congress. The work of the Congress will be taken in four sections, and in addition there will be five conferences. Friday, September 22nd, and Saturday, September 23rd, will be devoted to Section C, which comprises engineering and building construction, and the following subjects will be dealt with:—The disposal of refuse; the Statutory Registration of Architects, introduced by Ellis Marsland, hon. secretary, the Society of Architects, London; disposal of sewage; public slaughter-houses; baths and wash-houses; artisans' dwellings; and the National Registration of Plumbers. During the Congress there will be a Health Exhibition, and in addition to the usual hospitalities there will probably be included a ball and a banquet on Saturday, September 23rd, at which the Marquis of Lorne will preside.

Public Improvements at Nuneaton.—On Thursday, Mr. H. Percy Boulnois, M.I.C.E., held a Local Government Board inquiry into an application made by the Nuneaton and Chilvers Coton Urban District Council for permission to borrow £26,060 for purposes of sewerage and sewage disposal, and the purchase and adaptation of a site for a town hall, and other public improvements. It is proposed to construct the new sewage works at Mancetter, in the Atherstone Rural District Council's area; and this is opposed by that authority, by the Ansley, Hartshill, Mancetter, and Witherley Parish Councils, and by Mr. S. B. H. Chamberlayne. For the applicants it was stated that the growth of the town necessitated larger works, and the removal of the present ones was highly desirable, as buildings were being erected all round them, and they were not 700 yards from the market-place. Besides, the Local Government had been insisting on treatment on land since 1896, and had refused to allow loans without it. The opponents contended that there was suitable land available in the Nuneaton area, and that the Council was trying to save money by locating a nuisance out of its proper area. The land selected was nearly surrounded by public roads, the railway ran through it, and so did a main road. Land near by had been sold for building purposes, and the place was likely to become thickly populated.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.

THE LAND CO.,
68, CHEAPSIDE, E.C.

Unique Sites for Docks and Shipbuilding, extending from Chepstow Station to River Wye.

MESSRS. DRIVER, JONAS, and CO. beg to announce that they are honoured with instructions from his Grace the Duke of Beaufort to SELL by AUCTION, at the Beaufort Arms Hotel, Chepstow, on THURSDAY, OCTOBER 5th, at 10.30 a.m., in One Lot, 40 acres of valuable FREEHOLD LAND, similarly situate to the Llanarth Docks, Newport, Mon., having a frontage of about half-a-mile to the River Wye, and forming the entire block between the river and the Great Western Railway. The Chepstow Station is on the property, which has direct access from the town by the Station-road, and is especially suited for new docks, shipbuilding yards, engineering modern manufactures, or other large industrial enterprise, for using the tidal power, here the second highest in the world, the exceptionally favourable circumstances of which are seldom found in large ports. It includes the Chepstow Cattle Market, bonded yard, landing stage, and rich meadows, all let, at £140.

Printed particulars and plans may be obtained of Messrs. WILLIAMS and JAMES, Vendor's Solicitors, Norfolk House, Thames Embankment, London, W.C.; of JAMES GRAY, Esq., Solicitor (Messrs. Pemberton, Cope, and Gray), 5, New-court, Lincoln's-inn, London, W.C.; of S. H. COWPER COLES, Esq., Estate Office, Troy, Monmouth; and of Messrs. DRIVER, JONAS, and Co., Surveyors, Land Agents, and Auctioneers, 23, Pall-mall, London, S.W.

WIMBLEDON HOUSE ESTATE
COMPANY, LIMITED.

The Directors are prepared to receive PROPOSALS for the SALE or LETTING of SITES for Private Houses on this property, which is being developed by the Company as a high-class Residential Estate.

The land lies high with a deep gravel subsoil, and has a frontage of over half a mile to Wimbledon Common, and is well timbered.

The Estate, which until lately was the residence of the late Sir Henry Peek, is situated in the best part of this much sought after suburb, and commands extensive views over the Common to the Surrey Hills, and the excellent service of trains makes it peculiarly convenient to gentlemen whose pursuits command their presence in London.

Plans and further particulars may be had by applying to the SECRETARY, at the Estate Office, Parkside, Wimbledon, or to the Surveyor, GEORGE HUBBARD, F.R.I.B.A., 85, Gresham-street, E.C.

ANSELL and MALLOWS, Architectural Draughtsmen and Quantity Surveyors, 21, Buckingham-street, Strand, W.C.

R.I.B.A. EXAMS. PREPARATION, personally or by correspondence, in three, six, nine, or twelve months' courses. Architectural Lending Library. Special three months' finishing courses. — For full particulars apply to Messrs. HOWGATE and BOND, Associates R.I.B.A., Perchard House, 70, Gower-street, W.C. (close to the British Museum.

ARCHITECTURAL Institute, Society of Architects, and Civil Service Technical Examinations. Preparation by correspondence, personally, or in residence. Seventeen first places.—MIDDLETON and CARDEN, 19, Craven-st., W.C. 1

PLANS, Applications, &c., Prepared by an experienced Architect. Advice given in Building Act questions, and disputes settled. — Address, "Architect," 17, Algarve Road, Earlsfield, S.W. 2

FOR SALE in the MIDLANDS, Builder and Contractor's BUSINESS and PREMISES, including a first-class and nearly new Steam Joinery Plant, with extensive Shop, Stables, and Residence, nearly new, and specially built for the business. Last ten years' annual income from £600 to £700. Will clear for £1,800.

Reason for selling, going out of business. The above in a healthy country district. — Apply Box 1148, "BUILDERS' JOURNAL" Office. 1

SANITARY DRAINAGE WORK.—Brickwork, Pointing, Dilapidations, Alterations, &c., taken Contract by a practical Bricklayer, with plant and materials, or labour only, in large or small quantity. Town or country.—S. KIRBY, 83, Canterbury-road, Kilburn, N.W. 3

Important to Architects, Surveyors, Engineers, and all Interested in Building.

There will be issued early in September No. 4 of "SPECIFICATION." The publication has been still further increased in size, and now consists of 650 pages. In addition to the usual material in the book, which has earned for it the name of "the builders' Vade mecum," a large number of new features have been added, as will be seen from the following list.

COMPLETE PRICES IN EACH SECTION.
PRICES FOR ARCHITECTS AND ENGINEERS.
LEAKING WINDOWS. Illustrated.
THE DESIGN AND PLANNING OF FARM BUILDINGS.
NEW DIVISION. "MUNICIPAL ENGINEER."
NEW "GENERAL CONDITIONS" SECTION.
NEW "CONCRETOR" SECTION.
NEW L.C.C. DRAINAGE BY-LAWS, 1899. Sectionized.
THE MODEL BY-LAWS. Sectionized.
COMPLETE SPECIFICATION AND PLANS FOR A CHIMNEY SHAFT.
TWENTY-FOUR COMPLETE ENGINEERING SPECIFICATIONS.
THE DESIGN AND CONSTRUCTION OF LIME KILNS. With Special Illustrations.
WIRING FOR A COUNTRY HOUSE INSTALLATION. With Special Illustrations.
GRANITE PAVING.
WIND MOTORS. Illustrated.
DECORATION AND FURNISHING. PART III.
THE DESIGN AND CONSTRUCTION OF UNDERGROUND CONVENIENCES. With Special Illustrations.
ARCHITECTS' ACCOUNTS.
CHEAP ROOFS AND COVERINGS. With Special Illustrations.
SCHEDULE OF BUILDING TRADE WAGES FOR 73 BRITISH TOWNS AND 22 FOREIGN COUNTRIES.
AMERICAN STEEL CONSTRUCTION. With Special Diagrams and Details
THE OBLIGATIONS AND RIGHTS OF A SURETY FOR THE PERFORMANCE OF A BUILDING CONTRACT.
SECTIONAL INDICES AND COMPLETE GENERAL INDEX.
FRESH NOTES, CLAUSES AND DETAIL DRAWINGS.
SPECIFICATION DIRECTORY ENTIRELY REVISED AND CORRECTED TO DATE.

Owing to the keen demand for previous issues, and the difficulty experienced in quarters of obtaining copies immediately on publication, we are now prepared to register the names of subscribers, who will receive copies as soon as issued.

Please Supply a copy of "SPECIFICATION" No. 4, on publication, for which I enclose 5/6 to cover cost and postage.

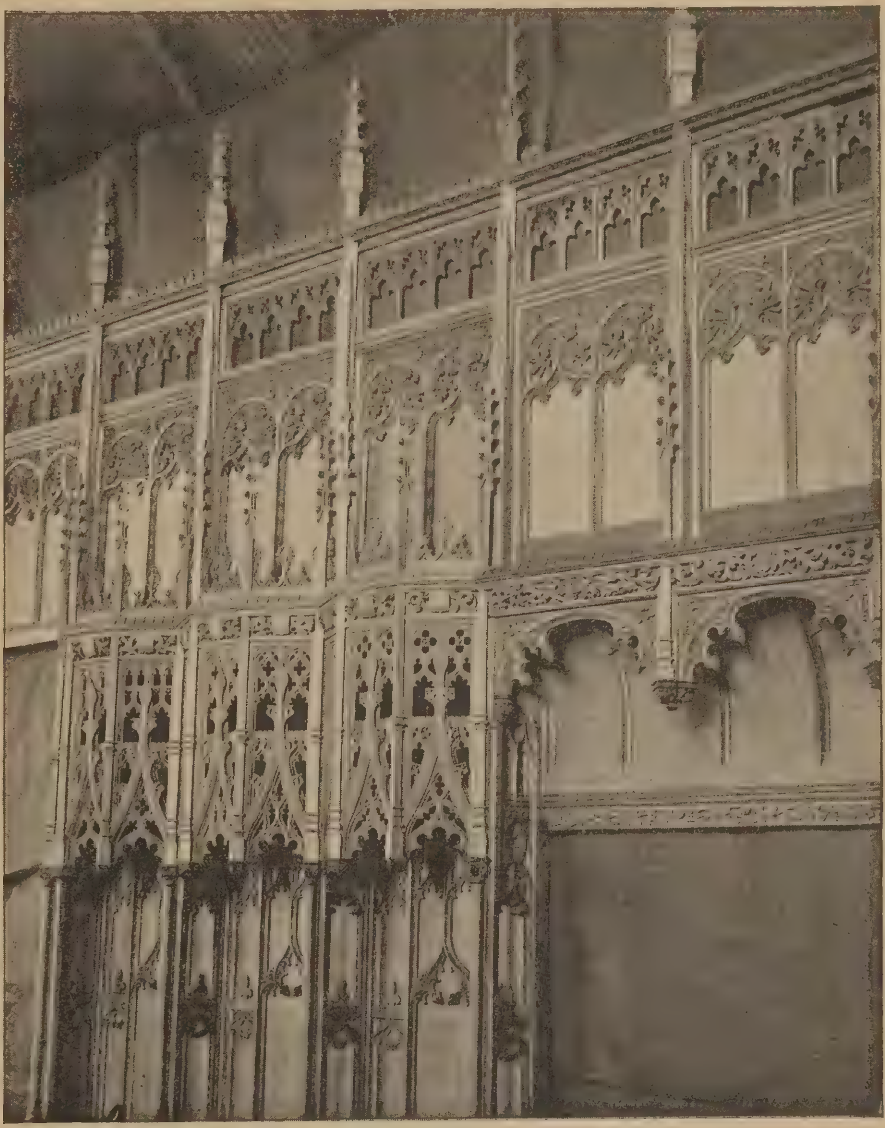
An Architectural Causerie.

Architecture in the Novel.—"Tess of the D'Urbervilles." IF a man wants to read good books, says that mordant philosopher Schopenhauer, he must make a point of avoiding bad ones. Continuing in the same strain somewhere else in his philosophy he tells us that it is well to read distinguished books twice, so that we may be the better able to understand the relation between the parts, and partly because we are not always in the same mood. In other words, he bids us follow in the footsteps of Quasimodo, who, by constant familiarity with the Cathedral of Notre Dame, came to realise the meanings and symbols of the bygone faith which lurked in all the angles and corners of the building. By association with the characters of Thomas Hardy, and the scenes where the dramas are played out, we may become as intimate with the districts and buildings as Quasimodo became with the spirit of Notre Dame. With the exception of two or three scenes towards the end of the story, "Tess of the D'Urbervilles"—one of Hardy's finest novels—is almost free from those wonderful descriptions of architecture that are found in "Jude the Obscure;" in place of them are the landscapes of "Blackmoor Vale" and the "Valley of the Great Daisies," that verdant plain so well watered by the river Froom. From there comes the sound of the reaping machine, the song of the breeze, as it whistles round the dairy house in the valley where Tess loved Angel Clare.

The two most beautiful descriptions of architecture are in the finishing chapters. In the last but one Tess, who is fleeing from "Justice" accompanied by Angel, passes through Melchester at night. "Out of the city, they plunge across an open plain. All around was open lonliness and black solitude. They had proceeded thus gropingly two or three miles further when on a sudden Clare became conscious of some vast erection close in his front rising sheer from the grass. They had almost struck themselves against it. 'What monstrous place is this?' said Angel. 'It hums' said she. Hearken. He listened. The wind playing upon the edifice produced a booming tune, like the note of some gigantic harp. No other sound came from it, and lifting his head and advancing a step or two, Clare felt the vertical surface of the wall. It seemed to be of solid stone, without joint or moulding; carrying his finger onward he found that what he had come in contact with was a colossal rectangular pillar; by stretching out his left hand he could feel a similar one adjoining. At an indefinite height overhead something made the black sky blacker, which had the semblance of a vast architrave uniting the pillars horizontally. They carefully entered beneath and between; the surfaces echoed their soft rustle but they seemed to be still out of doors. The place was roofless. Tess drew her breath fearfully, and Angel, perplexed, said 'What can it be?' Feeling sideways, they encountered another tower-like pillar, square and uncompromising as the first; beyond it another and another. The place was all doors and pillars, some connected above by continuous architraves. 'A very temple of the winds,' he said. The next pillar was isolated; others composed a trilithon; others were prostrate, their flanks forming a causeway wide enough for a carriage; and it was soon obvious that they made up a forest of monoliths grouped upon the grassy expanse of the plain." Later on we have another picture of the scene at the approach of dawn: "In the far north-east sky he could see between the pillars a level streak of light. The uniform concavity of black cloud was lifting bodily like the lid of a pot, letting in at the earth's edge the coming day, against which the towering monoliths and trilithons began to be blackly defined. . . . . The band of silver paleness along the eastern horizon made even the distant parts of the great plain appear dark and near; and the whole enormous landscape bore that impress of reserve, taciturnity and hesitation which is usual just before day. The eastward pillars and their architraves stood up blackly against the light, and the great flame-shaped sun-stone beyond them, and the stone of sacrifice midway. Presently the night wind died out, and the quivering little pools in the cup-like hollows of the stones lay still." Stonehenge—the heathen temple, as Tess called it—upon the probable origin of which so much has been written, is here brought vividly before the reader as it stands on "the great plain," lonely and desolate, except for the few tourists that visit it day by day.



FOR SELWYN COLLEGE CHAPEL, CAMBRIDGE. SIR A. BLOMFIELD AND SONS, ARCHITECTS.
(*See* page 51.)

Not so many miles from here is Melchester, where Jude the Obscure lived for a time. It is situated in a valley, and although the present inhabitants for the most part aspire to a belated "modernity," there still lingers in its streets and alleys, its churches and citizens, an atmosphere of the past which mildly protests against the encroachment of present-day civilisation. It had not always been situated in the valley, for about a mile away in a north-westerly direction is a hill where once stood Old Melchester. The site —formerly the scene of busy life and endeavour — rises gradually from the surrounding plain in two rings, the first and lower upon which the city was built, the second and higher where the citadel overlooked the town and valley. An early morning visitor will frequently find the top ring lightly clothed with a mist, that gradually rolls away as the first few rays of the Sun-god creep across the undulating plain, colouring in their progress the fields of stubble which, but a short while ago, were covered with waving corn, dotted here and there with poppies of a red, radiant hue. A whitewashed cottage, with thatched roof and small windows, catches the bright light, and the earth seems to stay its flight that the sunbeams might gaily dance upon the graceful spur of the Cathedral buildings of Melchester in the vale. Generation after generation has passed away, but there still remain on the site, and built into the boundary walls of the city on the plain, vestiges of the older Melchester. From legends and stories comes the tale of its rise and fall, finding a place on the leaves of the history book, at the time when first occupied by a tribe of Teutonic origin.

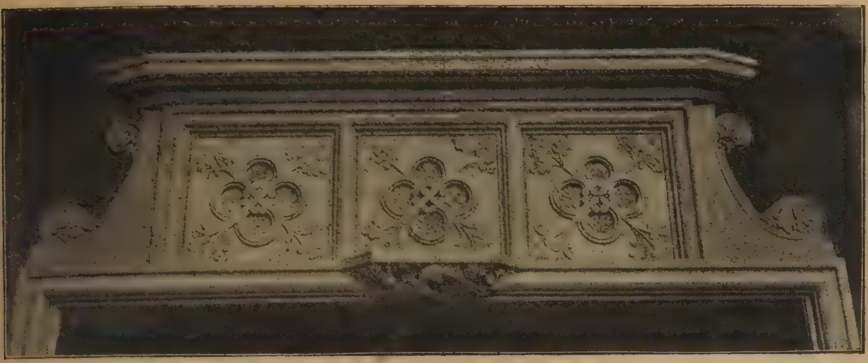
Another city—the one which witnessed the passing of Tess—is pictured in the last chapter of the novel, on the morning when "the President of the Immortals ended his sport with Tess." "The city of Witoncester, that fine old city aforetime capital of Wessex, lay amidst its convex and concave downlands, in all the brightness and warmth of a July morning. The gabled brick, tile, and freestone houses had almost dried off for the season their integument of lichen, the streams in the meadow were low, and in the sloping High Street from the west gateway to the mediæval cross, and from the mediæval cross to the bridge, that leisurely dusting and sweeping was in progress which usually ushers in an old-fashionod market day. From the western gate aforesaid, the highway, as every Witoncestrian knows, ascends a long and regular incline of the exact length of a measured mile, leaving the houses gradually behind. The prospect from the summit was almost unlimited. In the valley beneath lay the city, its more prominent buildings showing as in an isometric drawing, among them the broad cathedral tower, with its Norman windows and great length of aisle and nave, the spires of St. Thomas's, the pinnacled tower of the college, and more to the right the tower and gables of the ancient hospice, where to this day the pilgrim may receive his dole of bread and ale. Behind the city swept the rotund upland of St. Catherine's Hill, further off landscape beyond landscape till the horizon was lost in the radiance of the sun hanging about it." G. Ll. M.

On Reflection.

Stonehenge for Sale. After standing on Salisbury Plain for 2,500 years or thereabouts, the group of venerable stones which forms one of the most remarkable and mysterious ruins in the world is in some danger of experiencing the strangest vicissitude of its long history, viz., being transported to America. For the owner of the famous relics, Sir Edmond Antrobus, wishes to sell them, and an American gentleman has offered, we are told, to buy them. The mighty trilithons erected in an American park would be infinitely more grotesque and out of place than Temple Bar amidst the fields of Hertfordshire, and that is bad enough. Much of the mysterious charm of Stonehenge is due to its situation, and the only chance of discovering the secret of its origin seems to be in the excavation of the surrounding land. But the very idea is preposterous; to allow the venerable stones which were here before ever a Roman, much less a Saxon or a Norman, set foot on British ground, to pass into other hands would be almost an act of sacrilege. As well might we be expected to consent to the annexation of Cornwall or Kent by a foreign power; Stonehenge seems like part of our English soil. Happily the threatened calamity can be, and no doubt will be, averted. Before selling the place to the highest bidder, Sir Edmond Antrobus has offered to convey it to the Government for £125,000, a price which includes 1,300 acres of the surrounding land. The announcement of the threatened sale has caused quite a flutter of excitement and indignation, and there seems to be a general concensus of opinion that the Government must buy the ruins. Some think the price exorbitant; for ourselves we find it impossible to attach a money value to a unique historical monument like Stonehenge—no money payment whatever would compensate for its loss.

For the Nation or the Individual? These proceedings with regard to Stonehenge have given special timeliness to the discussion of two problems, neither of them new. The one is how to arrest the process of decay which is going on at Stonehenge. Year by year more of the stone becomes worn away, especially on the south-west face, and if the destructive force of rain and frost is not somehow arrested, it cannot be very long before the three remaining architraves will slip from their supporting columns, the foundations of which are being gradually undermined. Mr. Thomas Hardy, whose fine description of Stonehenge in his novel "Tess of the d'Urbervilles" is quoted in our leading article this week, has suggested that a wood should be planted to enclose the ruin and protect it in some degree from the wind and rain. That would, to some extent, alter the character of the landscape, but it would also, as Mr. Hardy points out, shut out the buildings that are gradually advancing over the plain and interfering with the impressive loneliness of the spot. The other question which these transactions have once more brought to the front, is the general one of the control of historical monuments. One does not need to be a Socialist or a Communist to experience a certain feeling of repugnance at the idea of any individual having the right to alienate or destroy, or to exclude the community from the enjoyment of objects of national interest which once lost can never be replaced. If the private owner regards himself as, in a sense, the trustee of the nation, and carefully and reverently guards the treasures in his possession, well and good. But if he regards them merely from the point of view of a vulgar commercialism, and ignores all artistic and sentimental considerations, it is surely the duty of the Government to step in and buy his interests at a fair valuation so as to preserve for future generations the sacred memorials of the past. We hope the action of Sir Edmond Antrobus will lead not only to the purchase of Stonehenge by the nation, but also to the concerting of measures for the acquisition of other national monuments, or the imposing on their present owners of stricter conditions in regard to their preservation and use.

A New Ideal City. From the days of Plato and the Apostle John, so many pictures of the ideal city have claimed the attention of mankind, and we are still so far from the realisation of most of these ideals, that men are apt to regard with impatience, or at the best with an amused incredulity, any fresh scheme for the establishment of ideal communities. That is the first and perhaps the greatest difficulty which Mr. Ebenezer Howard, author of "To-morrow," and the other enthusiastic folk who are acting with him, are likely to meet with in their attempts to carry into practice the principles of that little book. The word "Utopia" would spring naturally to the lips of the average man who should glance at the leaflets that lie before us as we write, setting forth the advantages of the proposed "Garden Cities" which it is the object of the newly-formed Garden City Association to bring into being. And yet there is nothing wildly Utopian about the scheme. Briefly, the proposal is to counteract the terrible overcrowding of our great cities and the evils incidental thereto, by building on a suitable site a city where manufactures and trade shall be carried on under the best possible conditions as regards sanitation, housing, open spaces, and so on. The city is to have not more than about 30,000 inhabitants, and the citizens are to retain for themselves the full advantage arising from increased value accruing to the land from their own exertions. The primary object of the Association is to discuss, and obviously much discussion will be needed before such a project can be carried out. For the moment we are not concerned with the details of the scheme, nor with pointing out the difficulties that lie in the way of its realisation; we shall probably return to the subject in a future issue. It is only fair to point out, however, that the scheme has several characteristics which differentiate it from other proposals having similar objects, and bring it more nearly within the range of practical politics. The new city is not to be founded in Paraguay or Tennessee, but in England and close to a railway. It is not a socialistic or communistic experiment; the citizens of "Garden City" may be as individualistic as they please. No one's property is to be confiscated and no one has to be compensated. If Mr. Howard's project ever becomes an accomplished fact, architects and builders will have a large and important share in its realisation. The chance of sharing in the building of a new city, which is to stand as an example of all that is excellent in construction and admirable in taste, is one which many of our best architects, would welcome with enthusiasm. Engaged in such a task they might well feel that their art was being put to the noblest possible use, and that they were indeed doing something to "build Jerusalem in England's green and pleasant land." Even those practical and unimaginative folk who would refuse even to consider the full programme of the Garden City Association may well admit that in seeking to check the growth of great cities by forming new centres of industry in country districts the Association is moving in the right direction.



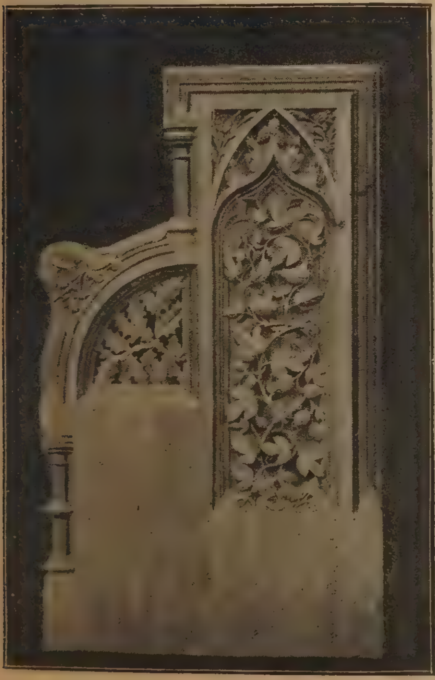
CHIMNEYPIECE FOR A ROMAN CATHOLIC PRESBYTERY. G. G. SCOTT, ARCHITECT.

A NOTABLE FIRM OF BUILDERS.

BY ERNEST RADFORD.

It is customary for writers and speakers to refer to the golden age of the guilds as if our own were the worst That the guild, like its modern successor the "union," was a frightfully exclusive body, and that the independent worker lived in fear of his life, is not so often remarked as it might be. I take it that the average man of a former age was about as narrow-minded and mean as the worst of ourselves, and the fact that he inclined to combine with his fellows when it was obviously the right thing to do is in no way remarkable. What was gained in the guild would appear to have been an amount of individual liberty which is rarely possessed to-day. Agreed that the guild and its members (none other) should execute certain works—then to each was allotted his portion, and we gather from what we have read that within the pale of these safe-guarded communities there was at least freedom from care, and a feeling of fellowship, failing which one had better be dead. Its members were not merely contented, but prone to be merry, for "Mirth that wrinkled care derides" is evident in much, very much of their work. Has anyone seen two *misereres* alike? And is it not perfectly clear that the modern time-limit renders it absolutely impossible that such will be seen again?

The worker in the guild may in this respect be compared with the monk, for the scribe, however humble his station, was free at least of his soul while engaged, regardless of time, on the sacred page of the missal. Except under kindly conditions, we cannot have art work done, and it may be said without exaggeration that the aspect of the things for the worker was utterly changed, and changed for the worse, when the funds possessed by the guilds were diverted into the king's pocket. "They were included in the Act for the suppression of the Colleges and Chantries in 1545, and those that then escaped fell in the first year of Edward VI." Of this measure the author of "Life in an Old English Town," writes: "It was the sweeping and iniquitous Act of confiscation known as the suppression of the guilds and chantries, rather than the dissolution of the monasteries which brought the citizens to the verge of ruin."



FOR SOUTHWELL CATHEDRAL. EWAN CHRISTIAN, ARCHITECT.

That the guilds became rich is well known, but these riches were freely bestowed on the poor of the towns and the workers, whereas the immediate result of the Act was a disastrous change of masters, the effects of which change are felt to this day, as it has beggared the spirit of art. That the artisan pure and simple is neither morose nor rebellious by nature we know very well. If he whistles over his work you may be sure he is perfectly happy. If silent, his silence is ominous, so it is not merely Christian but politic to attend to his needs sometimes.

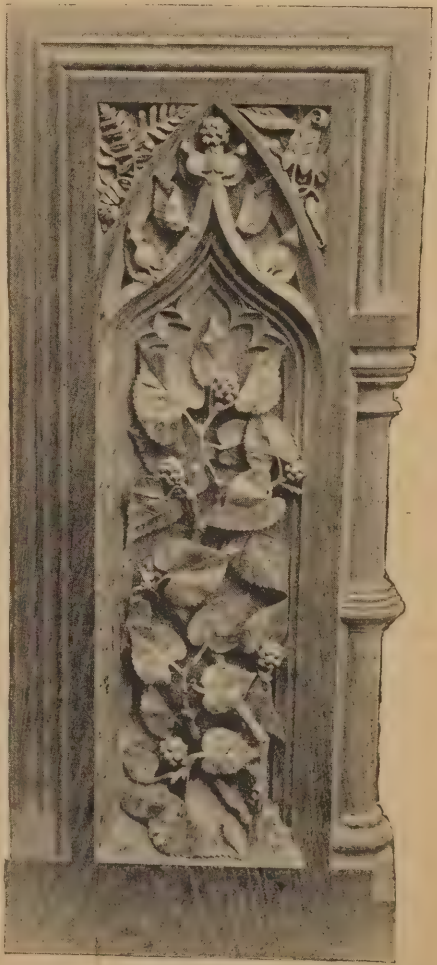
We cannot recall the past nor effect sweeping reforms all at once, but, watching the signs of the times, there are welcome indications of change; most welcome of all a disposition to recognise the dependence of the architect's art on the crafts, and *per contra* of the mere worker upon the inspirations he owes to something, not himself, that fellowship kindles and fosters. Mr. Fellowes Prynne, in a recent presidential address to the Architectural Association, referred to a good time coming when every practising architect will recall with the greatest pleasure the hours that were spent in the workshops and demonstration rooms attached to the Schools of Design, and count the experience among his chiefest possessions. But most important of all, I venture to think, because most generally lacking at present, is not so much the practical knowledge as the sympathetic understanding between Society's creatures and Nature's gentlemen which should be gained in this way. The historian of the future may wonder what parted them, and set himself to find out.

I may seem to have come by a somewhat roundabout way to the point at which I should have started, but Thought connects a good many things which may seem unrelated, and I have purposely dwelt in the past because, in fact, it is not at all easy to speak of modern work without being suspected of log-rolling, if individual artists are boomed, or of being the recipient of bribes when the work of a firm is praised. If the best is perhaps the least known, I suspect it to be for this reason. If here and there an unostentatious firm is discovered, it may be regarded as certain that it turns out exceptional work.

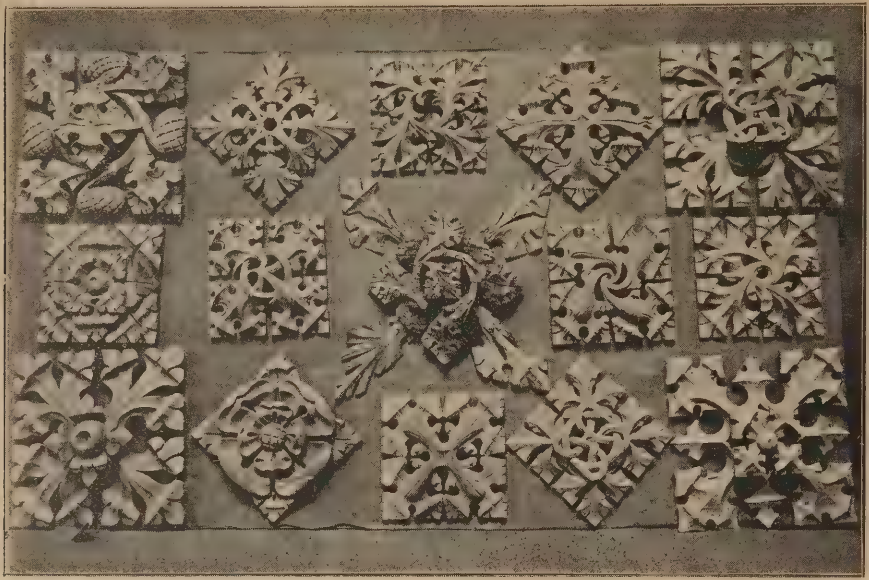
In converse with a wood-carver who is thought to be second to none in the kingdom, I discovered that he had been born and bred in North Walsham, the place where the works of Messrs. Cornish and Gaymer, the firm referred to in these notes, are to be found. I could not say more without echoing what I have heard of the master, and as for the workers, if I assume them to be happy, it is because I am quick to detect love or its absence in so-called art-work. I may say as to this, and it goes to the root of the matter, that the master, as he resides in the place, appears to be more in touch with the men than the ordinary architect can be. We have here examples of work in all, or nearly all, styles, and given the photograph, can judge fairly well of its quality. Of the "prentice hand" there is not a sign, I believe. The perfunctory visit which the architect pays to North Walsham will hardly make him more welcome than the policeman is to the child, and it is not to our purpose to say much about architects here. In the original designs for the choir stalls, lately restored at Southwell, there was the merest hint of the architect's wishes. For a model to be dealt with rather than copied, the workman has probably had before him some specimen of the original, and this is inferred from the fact that no two are alike.

Though unlike a well-ordered museum as possible, there is yet in these works, in the way of examples of ecclesiastical art, nearly all that could be desired, and if appearances are to be trusted it may safely be said that in the timber yard here is one of Nature's own training schools. The heads of the firm would be described, I suppose, as contractors and builders, for their undertakings include some of the most important works in the kingdom; they are as much concerned with the raw materials as with the beauties incidental to art that may be educed from them, and I gather from what I have seen that love of the finest material, the love that experience teaches, is nowhere learnt better than here. What pleased me as much as the timber were the specimens of workable stone that, carefully selected and labelled, are sent from all parts of the country.

The illustrations accompanying this article show a few examples of work carried out at the workshops of Messrs. Cornish and Gaymer.



FOR SOUTHWELL CATHEDRAL. EWAN CHRISTIAN, ARCHITECT.



FOR MOBERLEY CHURCH, CHESHIRE. W. D. CAROE, ARCHITECT. (*See p.* 51.)

"LAVENGRO" AT STONEHENGE.

To all who are in any way connected with the builder's craft the giant monoliths of Stonehenge—that supreme mystery of masonry—must possess a special interest. In view of the threatened sale of these unique relics of the mighty builders of a prehistoric age, it is interesting to recall the recorded impressions of writers of genius who have felt the fascination of Stonehenge. The remarkable word picture in which Mr. Thomas Hardy describes the "forest of monoliths" will be found quoted in our leading article. Scarcely less striking is the following passage from "Lavengro," in which that eccentric but wonderfully gifted writer, George Borrow, has recorded his impressions of the place :—

"In the midst of the tongue of sward formed by the two roads, collaterally with myself, I perceived what I at first conceived to be a small grove of blighted trunks of oaks, barked and grey. I stood still for a moment, and then, turning off the road, advanced slowly towards it over the sward; as I drew nearer I perceived that the objects which had attracted my curiosity, and which formed a kind of circle, were not trees, but immense upright stones. A thrill pervaded my system; just before me were two, the mightiest of the whole, and all, as the stems of proud oaks, supporting on their tops a huge transverse stone, and forming a wonderful doorway. I knew now where I was, and, laying down my stick and bundle, and taking off my hat, I advanced slowly, and cast myself—it was folly, perhaps, but I could not help what I did—cast myself with my face on the dewy earth, in the middle of the portal of giants, beneath the transverse stone. The spirit of Stonehenge was strong upon me."

A shepherd whose sheep come browzing past the circle of stones enters into conversation with the wayfarer. Says the shepherd :

"'Heard of the stones, I suppose? No wonder; all the people of the plain talk of them!'

'What do the people of the plain say of them?'

'Why, they say—How did they ever come here?'

'Do they not suppose them to have been brought?'

'Who should have brought them?'

'I have read that they were brought by many thousand men.'

'Where from?'

'Ireland.'

'How did they bring them?'

'I don't know.'

'And what did they bring them for?'

'To form a temple, perhaps.'

'What is that?'

'A place to worship God in.'

'A strange place to worship God in.'

'Why?'

'It has no roof.'

'Yes, it has.'

'Where?' said the man, looking up.

'What do you see above you?'

'The sky.'

'Well?'

'Well!'"

The strange colloquy presently turns into other channels. The distinction between "English" and "British" is discussed. The shepherd asks :

'Who were the British?'

'The men who are supposed to have worshipped God in this place and who raised these stones.'

'Where are they now?'

'Our forefathers slaughtered them, spilled their blood all about, especially in this neighbourhood, destroyed their pleasant places, and left not, to use their own words, one stone upon another.'

'Yes they did,' said the shepherd, looking aloft at the transverse stone.

'And it is well for them they did; whenever that stone, which English hands never raised, is by English hands thrown down, woe, woe, woe, to the English race; spare it, English! Hengist spared it!'"

In the light of recent events it would seem that there are some amongst us to-day to whom that final imprecation and appeal might with special appropriateness be addressed.

R.I.B.A. Examinations.—It may interest architectural students in the north of England to know that the R.I.B.A. Board of Examiners have agreed to make Newcastle a permanent centre for an annual preliminary and intermediate examination in June, provided there are sufficient northern candidates.

New Lungs at Openshaw and Crumpsall.—The recreation ground in George Street, Openshaw, and the new park at Crumpsall were formally opened on Thursday by the Parks Committee. The recreation ground extends to a little over seven acres and has cost £13,000. The new park is about twelve acres in extent and has cost £24,000.

A Masonic Hall and Club at Richmond.—It is proposed to erect a Masonic hall and club, on the site now being cleared for the purpose, near the Fire Engine Station. Mr. F. Brewer, architect, of Richmond, has prepared plans of the proposed building, which will contain a public hall having a vestibule, retiring rooms, &c. There will also be a large suite of offices. Beneath the large hall there will be a lodge room. A set of club chambers is also shown on the plans.

DUBLIN FOR THE ARCHITECTURAL STUDENT.

AN ADDRESS TO STUDENTS.

By THOMAS DREW, F.R.I.B.A.,
Pres. R.I.A.I.

(*Concluded from page 37, No. CCXXXVII.*)

Gandon used Corinthian columns, of his own choice, where the ground fell from the front, and so avoided obstructive bases and pedestals which would of necessity have been entailed by Ionic columns ranging all round. If any superior critic says that the architectural façade facing College Street on a fine, frosty, sunny morning is a stupid solecism, and not a fine congruous and satisfactory composition to do an architect's heart good to look at, I had rather not know so pedantic and fastidious a person.

In 1801, when the Bank purchased the poor played-out legislative shop from the Government for £40,000, some other "accidents" were the making of the design. There was a competition of architects. One, Baker, a drawing master and self-styled architect, is given credit for this. I do not believe a word of it. The marks of the hand of this audacious drawing-master architect were elsewhere to be seen at Christ Church and at St. Andrew's, and prove him an imposter and of accursed memory.

Francis Johnston, who carried out the alterations for the bank in 1802, was at least an architect, if a modest and unostentatious one. As a first improvement, Johnston saw his way to making the two quadrant sweeps correspond by building up a solid wall behind Parkes' Quadrant Collonade on Foster Place side, and by adding three-quarter engaged columns to Gandon's Quadrant on the College Street side. It scores for Johnston to have had so much good judgment and common sense. Some architects of our day would have seized the opportunity to exhibit their original genius and record it. They would probably have cut holes in Gandon's wall and interpolated Venetio-Gothic windows and balconies, inspired by Ruskin's stories of Venice, and have spoiled another corner of Dublin. Another happy touch of Johnston's to the building was the abolition of the glass windows in the great central portico, incongruous with its classic dignity and reflecting little glittering lights from the old-fashioned small panes of twisted crown glass of the description that still lingers in Dublin. A top-lighted cash office behind the screen wall dispensed with side windows, and so came about that fine solid monumental wall on which the pillars of the portico project such grand shadows in sunlight and moonlight.

Castle left his mark all over the country. Among his best known works are the older

FOR SELWYN COLLEGE CHAPEL, CAMBRIDGE. SIR A. BLOMFIELD AND SON, ARCHITECTS. (*See p.* 51.)

part of Leinster House, Tyrone House, the original Rotunda Hospital and Round Room, and many houses of the nobility and gentry of his day. One who is interested may meet his work in unexpected places up and down the country. There is no mistaking Castle's vigorous detail when your meet it, carried out with such artistic ability as his following of French and Italian colonists, carvers, modellers, iron workers, stucco workers could compass. Of the ordinary sort of Castle's work in private houses, near and convenient examples are of easy access, such as Ely House, Ely Place, the Church Representative Body's House, St. Stephen's Green, E., part of Leinster House, Tyrone House, and a fine old house in Henrietta Street, with a grand hall and staircase, now being dismantled and degraded into tenements.

Castle had a great practice, and was a benevolent and thirsty soul, who took a great deal of interest and whiskey punch, it is said, with his friend, Dr. Bartholomew Mosse, during their promotion of the first lying-in-hospital of the kingdom. He took one bumper too much for his health one night when down at Carton on business for the Duke of Leinster, and died suddenly in 1751, and was buried under the amazing big yew tree in Maynooth Churchyard.

While this bold architecture was being raised at the Parliament house the university was rebuilding Trinity College on the opposite side of the street in a tamer yet correct manner. Sir William Chambers (irreverently known in the office in the days of my youth as the "Cocker" of architecture, and whose big folio as an authority ranked with Holy writ) was the architect of new Trinity College, which superseded the Elizabethan buildings, and wiped out the last remnants of the Monastery of All-Hallows. His work was being built about 1770, when Parkes' and Gandon's work over the way was going on. Chamber's façade towards College Green stands on the lines of the old Elizabethan brick building which preceded it. Parliament Square, with its Chapel Hall and Refectory, is Chamber's characteristic work. He never visited Ireland. He sent a good sketch model of his design, which may still be seen in the college, and the plans and specifications were sent over by him and paid for at the correct 2½ per cent. His Casino at Clontarf for the Earl of Charlemont is illustrated in his big folio.

Thomas Cooley is the name of a Georgian architect, to be held in as great respect as those before mentioned. It was a competition that brought him to Dublin, and it was for the Royal Exchange, now the City Hall. There was the usual scheming and jobbing and working the oracle for friends, just as it might have been in our own century. I suspect there was an honest assessor. Thomas Cooley, of England, won the game with the best design. Thomas Sandby was placed second. James Gandon, run for the job by the all-powerful Beresford family, came in but third.

Space would not admit of dwelling on this work of Cooley's. It is, in a word, a refined and well balanced design of a master of English Renaissance architecture. It has but one crowning defect in a miserable ballustrade stage. Cooley served his time to a carpenter, and the poor wooden stair ballusters wrought in stone, are perhaps a reminiscence of his earlier craft. Cooley also was the designer of the Courts of Law—a remarkable building. He died before it was well begun, and his competitor, Gandon, finished it, and, improperly, is generally credited with the whole authorship.

James Gandon is a great name among this galaxy of architects of Dublin. His great work is the Custom House, and there is much study to be got out of it. It always strikes me when I am showing Dublin to the stranger architect that he is taken by surprise with its dignified architecture, and, most of all, the Custom House fetches him. There is a cast about it out of the common, and a dignity of simple mass that gets away altogether from the School of Wren, or Hawkesmoor, or Gibbs, familiar in London. Gandon was a sculptor first and an architect afterwards. There is a monumental disposition of parts in the Custom House that grows on one the more it is studied year by year.

If we except the stone soup-tureen, which serves as *acroteria*, and chimneys, and *smoke*, some of the details of this building are exquisite studies. Smyth's River-God keystones are unsurpassable, and the pose and *role* which the four statues (Europe, Asia, Africa, and America) play in the composition of the north front, facing Gardener Street, is of that true art which conceals art. In a little hall, seldom passed through by any but victims going to be eviscerated (figuratively speaking) by the detestable inquisition of the Income Tax, it is worth while to look for a small-scale treatment of the Ionic order, unsurpassed by any great example. It would be hard, we admit, for our good friends, the official architects, who are housed in this pile, to "live up to it." One feels that it is essentially frivolous for the Board of Works to court the Manes of the late departed Queen Anne and curly-wig its pediments in its official works.

FOR SELWYN COLLEGE CHAPEL, CAMBRIDGE. SIR A. BLOMFIELD AND SONS, ARCHITECTS. (*See* p. 51.)

Robert Mack was architect of Powerscourt House in William Street, and it is no despicable work; the date is about 1780.

Vincent Waldre, a whilom architect of the Board of Works, was a clever scene-painter architect about 1790. It is in St. Patrick's Hall, the one great State apartment of the Castle, that Waldre with his own hands painted on the oval ceiling of my Lord Newcomen's drawing-room, the sweet little cherubs that float up aloft on French grey skies, and now keep watch over the dear head of our Sir Charles Cameron, chief sanitary officer of our City of Dublin, and an honorary Fellow of our Institute of Architects. You can turn into many a house in Dublin and find bits of interest like this ceiling. I could show you a house in Mountjoy Square with mantelpiece frame plaques of Wedgwood's that are priceless. The student might do worse, for instance, with an idle hour than turn into the Church representative body's house in St. Stephen's Green and study the bold stucco decoration, thumb-moulded and modelled on walls and ceilings, and Angelica Kaufmann's lovely decorative painting in the old drawing-room and ball room, and some exquisitely detailed Italian chimney pieces.

I have not even touched upon Mediæval Dublin, as illustrated by its few surviving fragments, chiefly in its two cathedrals. It is a marvel that there is so much good Gothic work left in Dublin, and that it is so little studied. While there is nothing of the fourteenth or fifteenth century to study, there is good work of the thirteenth, enough for the student to discipline himself in drawing and measuring in the methods of Mediæval work, of its constructive origin, and the scale of its detail.

St. Patrick's Cathedral presents more for study than is generally appreciated. It has a very symmetrical and beautiful plan which has been preserved through all its indignities, mutilations, and restorations. It is worth measuring and laying down to demonstrate that the design was conceived on a rigid system of equal equilateral triangles applied to plan and section and elevation of the nave and choir arcade, triforium and clerestory. There is some old and genuine work in the choir and north choir aisle. There are some neglected Mediæval monuments that should be recorded and published. There is a Lady Chapel so well restored by Carpenter in 1845 that the student may regard it as a perfect preservation of beautiful work of 1255, as good as work of that period in the Temple Church, London, from which came, no doubt, inspiration by Henry the Londoner, the Anglo-Norman Archbishop of Dublin. There is a fragment of the Church of St. Patrick de Insula, precedent to its adoption as a collegiate and ultimately cathedral church by Archbishop Arnym, 1190, not yet investigated.

But of the old intra-mural Cathedral of the City, the Danish foundation of their Christchurch (Cathedral) of the Holy Trinity, there is no room to write within the compass of a paper like this. It is a subject for one as long in itself. There is enough left of fragmentary ancient work of the twelfth and thirteenth century and of beautiful detail to illustrate its history; and its store of records in MSS. is great and unbroken from the time of Sitric, the Danish king-founder in 1038, and the Anglo-Norman superstructure of 1190 and 1234 yet stands upon the Crypt Church of the Christianised Danes of 1038. The story of the Dublin Cathedrals has not yet been fully written. That the story of the interesting and unique chief church of Dublin, fully told and illustrated, would be enough for a publication by itself, is evidenced by the crowd of Dublin citizens who throng the church on each St. Stephen's day since its restoration by Mr. Street, when, by direction of the Dean and Chapter, a popular account of the church and its history is given at the tomb of its Anglo-Norman founder, Paul Strongbow.

WITH GREEK BUILDERS.

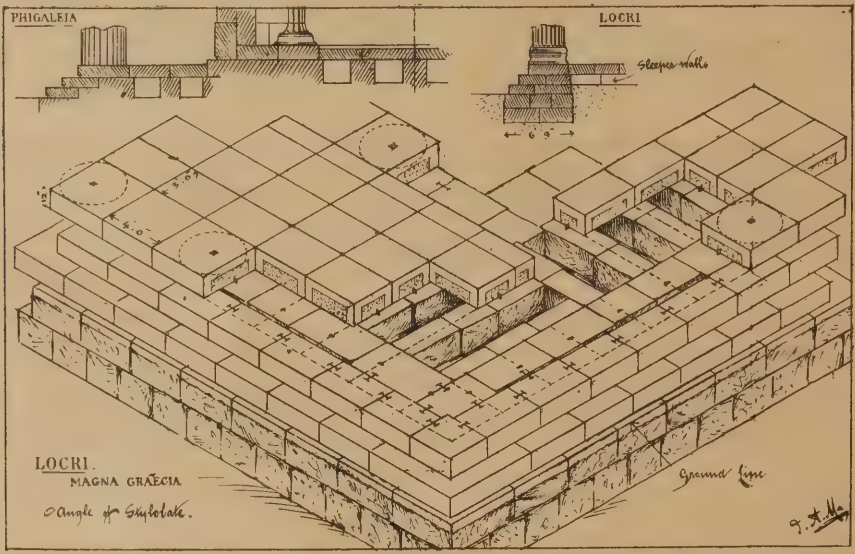
II.—CONSTRUCTION OF THE STYLOBATE.

BY JOHN A. MARSHALL.

(Continued from page 21, No. CCXXXVI.)

> *"Lo, a mossy architrave is here!*
> *I discern thee, fashioning spirit!*
> *On the stone thou hast impressed thy seal."*
> —GOETHE.

FOR the moment, however, we ask the student to confine his attention to the platform, or stylobate, on which the plan of the temple is inscribed, as on a huge drawing board. This platform, as usual, is raised three steps above the paving of the peribolus, and to receive the bottom step the top offset of the foundations is worked fair and flush with the ground, to show as a clean margin all round the foot of the peristyle. At Corinth, it will be remembered, the bottom step is hewn out of the rock on which the temple is built; and at the "Theseion" it is of the same material as the foundations, viz., hard Peiraic stone, the two upper steps being of Pentellic marble. In passing, we note that the foundations are constructed of very large stones, laid in alternate courses of headers and stretchers, diminishing in width towards the top, and that the stones are squared and fitted close together. For the arsenal at Zeia, the foundations are specified to be built of long stones, laid lengthwise and crosswise; on the top is to be laid a guiding course of worked stone, 3ft. wide, 1ft. 6in. thick, and 4ft. long, to receive the walls.



In ascending the steps of the stylobate, you will find that their height is not limited for your convenience; the object has been to provide a basement of suitable proportions for the superstructure.

An easy ascent was, however, sometimes provided to the principal entrance of large temples by a narrow flight of small intermediate steps, which did not interfere with the general massive character of the basement. Traces of such steps have been found at the Parthenon, but at Ægina, Olympia, and Delphi, a narrow incline, or ramp, was formed with the same object. In the case of the Propylæa, at Athens, some concession was made to convenience by limiting the height of each step—for so large a building—to 10in. As a rule, the height of the steps was not made uniform, but increased towards the top.

Where a portion of the top step has been displaced, you can see that the stones of the step below are tied together with H-shaped iron clamps, run with lead; the clamps are inserted in the top beds, so that they were covered and protected from the weather by the superimposed steps. All the stones are secured to each other vertically by iron dowels, which are let into the top and bottom beds, at the ends of each stone, to facilitate the running in of the lead. Especial care was taken, it will be observed, at the angles of the stylobate, in fitting the stones together, and clamping them to the backing stones (see sketch from Locri). The blocks are uniform in length, breaking joint over the middle of each, but in early work they sometimes vary, and then the jointing, in relation to the columns, is quite irregular, as at Assos, in the Troad, and the early temple on the promontory of Sunium.

When the jointing is regular, in Doric temples, the centre of the columns is either over a joint of the top step or over the middle of a slab; instances of the latter arrangement are the temple of Zeus at Olympia, the Propylæa at Athens, and the later temple at Sunium.

In the Ionic temples of Asia Minor the joints were rarely or never under the columns, but at Athens the columns of the Erectheion and the shrine of Niké Apteros are placed over the joints.

In building the superstructure of a peripteral temple it is probable that the heavy work of the peristyle was erected before the walls of the cella, as at Segesta. But whatever the course adopted, it is evident that the stylobate would be subject to rough treatment during the operations; it was not, therefore, expedient to work a fine face on its surface, so it was only coarsely tooled, and often left in that state after the completion of the building.

To receive Doric columns square or circular beds were sunk below the rough surface of the top step, leaving a fillet—in the case of square beds—along the front edge to protect the arris, and a notch was cut through the middle of the fillet to drain off the water, as at the Propylæa, Athens, and the temple at Rhamnus. At Segesta the beds are circular, with a notch in front; at Thoricus there is no fillet.

To bed the steps properly it was necessary to sink below the rough surface along the back of each tread, and to cut a draft along the bottom of each riser. These sinkings defined the finished faces, so that the stones could be set accurately to a line inscribed on the prepared beds.

The draft on the riser was sometimes interrupted by projecting pads or fillets, which were left on each side of the vertical joints to protect the arrises before the stones were placed in position; such projections are found at Assos, Segesta, and the Temple of Zeus at Olympia.

These technical peculiarities, including the projecting knobs or ancones—the use of which was perhaps to facilitate the moving of the stones—were very often permanently retained, and it is evident that their obliteration in temples of the Doric type was not regarded as essential. Indeed, in later work the drafts and fillets were sometimes elaborated as a matter of design, apart from utility. Thus at Phigaleia the elaborate treatment of the risers was evidently designed to be permanent, although it is clearly based on the temporary expedients before mentioned.

In Doric temples, the orthostatæ, or stones forming the deep lower course for the walls of the cella, had a draft at the bottom, like the risers of the steps, and for the same purpose. The Theseion is an exception; there a projecting moulding takes the place of the draft, as in Ionic temples.

When the paving of the temple was not bedded on the rock, it was a common practice to build sleeper walls to receive the slabs, placed at intervals equal to the length of each stone. For the ambulatory these walls were generally placed transversely, but for the naos, the pronaos, and the epinaos, they were placed longitudinally. At Phigaleia, the paving throughout rests on sleeper walls running longitudinally. At Delphi the slabs rest on walls both longitudinal and transverse.

For the stylobate of the Parthenon such walls were dispensed with, and the paving slabs, which are 12in. thick, rest on a stratum of coarse stone from the Peiraic quarries. Some of these stones seem to have been used for an older building.

The stylobate of the temple at Sunium is really a marble casing to an older stylobate of coarse stone; the original work was kept almost intact, but around the outside the foundations were added to with walling stones and architrave blocks taken from the earlier temple. The paving of the present stylobate is about 16in. above the old level, and to take the new marble paving, transverse slabs of coarse stone 9in. thick were laid on the old pavement.

For the ambulatory, the pronaos, and the epinaos, the slabs were usually arranged so that the jointing intersected like the lines on a chess board; but inside the naos only the longitudinal joints over the sleeper walls were continuous, the transverse jointing being irregular.

Respecting the manner of working such paving stones, some interesting information is given on an inscribed slab found some years ago built into the wall of a blacksmith's shop in Lebadea, a town in Bœotia.

Among other matters the inscription contains some practical stipulations for working and setting thirteen paving stones for the south flank of the temple of Zeus the King at Lebadea.

Pausanias records that in the second century, A.D., the town was adorned with buildings not inferior to any in Greece; but, he adds that the temple of Zeus the King was unfinished. Remains of the floor, and of the cella walls, were to be seen in the middle of the present century; but the stones have since been used for a church.

Unfortunately, the inscription bears no exact evidence as to date, but it probably belongs to the second century, B.C.

The thirteen stones to be worked were to be placed next to, and correspond in dimensions with, some already in position; these latter were most likely a row of paving stones next the cella wall, so that when the new stones were placed there would be a continuous longitudinal joint, with transverse joints intersecting at regular intervals, according to the spacing out of the columns.

The slabs already placed were resting on sleeper walls, the top bed of which, where exposed, had been left in a rough state. In addition to the sleeper walls there was also a ledge formed by the top off-set of the foundation along the inside of the peristyle. Thus each of the new slabs would have a bearing on three sides of its bed.

The spaces between the walls were generally filled in with stone chippings, but the paving was independent of this, and in preparing the beds it was only necessary to work three smooth margins, leaving the intermediate parts in a rough state.

The blocks are specified to be of hard Lebadean stone, and are to be supplied and delivered to the contractor at the temple, but no stone is to be worked until it has been examined and passed as sound by the officials, and if any delay occurs in the delivery of the stones, due allowance is to be made to the con-

tractor for the time lost. If a sound stone is spoilt in the working, the contractor is to provide another at his own expense, without delay, and remove the spoilt stone from the temple precincts within a stipulated time, failing this, he is to pay the full value of the stone and half as much more. The contractor is not to be held responsible for a stone which may turn out to have some natural defect.

In working a stone, the bed or underside is first to be brought to a tolerably even surface with a coarse-toothed chisel, then the three margins or bearing parts are to be cut down about half an inch below the rest and gone over with a close toothed chisel; the margins are to be tested by applying a canon or straight-edge not less in length than the stone, and 6in. by 4½in. scantling.

The sides or vertical faces are next to be worked to plane surfaces and at true angles, by applying the square. To get a true adjustment to the adjoining stones a smooth margin is to be worked on the top and sides only of each face, using a smooth sharpened chisel. While for the intermediate part—which was sunk a little below the margin—a coarse-toothed chisel is to be used. This method of treating the vertical joints is universal in Greek masonry, and ensured perfect accuracy of adjustment with the least labour.

Stone canons are to be applied in some way to the vertical faces, and in connection with this operation is a reference to the use of vermilion, but how or why it was employed, is not clear. A general clause stipulates that pure olive oil and vermilion of Sinope is to be used for the canons, and in default the contractor is to be fined by the officials, and no stone is to be locked in until the officials are satisfied that this requirement has been complied with.

From this it may be inferred that the use of vermilion was not restricted to making the lines in setting out the work; it would almost seem that the bearing parts were to be rubbed with this composition, using the stone canons in the process, the object being, perhaps, to render the joints still more accurate and water-tight.

These canons are to be repeatedly cleaned or scraped, and corrected by a stone canon kept in the temple, whenever the contractor is ordered to do so by the officials. Vermilion was also applied to the wood canons to enable the workman to readily detect irregularities on the surface of the stone.

Traces of this colour have frequently been found on newly exposed jointing of Greek masonry, although it is not probable that the composition was applied as a permanent coating, especially in view of the fact that in the inscription under notice the joints are specified to be cleaned with soda and pure water before the stones are placed in position; possibly the colour found was merely a portion that had accidentally got on to the rough intermediate parts, and which it would not have been worth while to wash off.

When the contractor has worked the new stone he is to turn his attention to the thirteen stones *in sitû*. The exposed vertical faces of these had apparently been left in a rough state, as a protection, pending the completion of the new work, and perhaps to admit of more accurate adjustment. In the first place, a cord was to be stretched the whole length of the stones, near the edge, to get a line parallel to the walls of the cella, and which should mark the longitudinal joint, so that the irregular part in front could be accurately cut off.

The exposed vertical faces were then to be reduced to an even surface and tested by applying a wood canon or straight-edge, not less in length than 20ft., and 6in. by 4½in. in cross section. The stones being *in sitû*, of course permitted the use of a longer canon than when the stones were worked singly.

To ensure an accurate correspondence with the margins of the new stones, the old are to be treated exactly in the same way, and rubbed with a stone canon, using vermilion properly, and the stone canons are to be repeatedly tested by the one kept for the purpose in the temple.

When the new stones are about to be placed, the exposed top beds of the sleeper walls, which had been left rough, were to be re-dressed with a close-toothed chisel. The new stones were then to be placed, beginning at one end, and proceeding in regular order, after the beds and joints have been shown to the sub-architect, and cleaned with soda and pure water.

The insertion of the iron dowels and the running of the lead is to be done in the presence of the officials or their representative, the contractor being also present, and the weight of the metal actually used is to be recorded at the time; and should any stone be locked in that has not been shown, it is to be taken up and re-worked, and the contractor fined as the officials may determine. After the stones have been placed, the top surface is to be dressed with a clawed tool, and the long canon and the level applied throughout, having regard probably to the falls for carrying off the water, and to the optical refinement of the curve of the stylobate. Pieces of dry olive wood are to be prepared, and these were perhaps used as blocks for adjusting the canon when taking the levels.

(*To be continued.*)

Correspondence.

DELPH STONE.

To the Editor of The Builders' Journal.

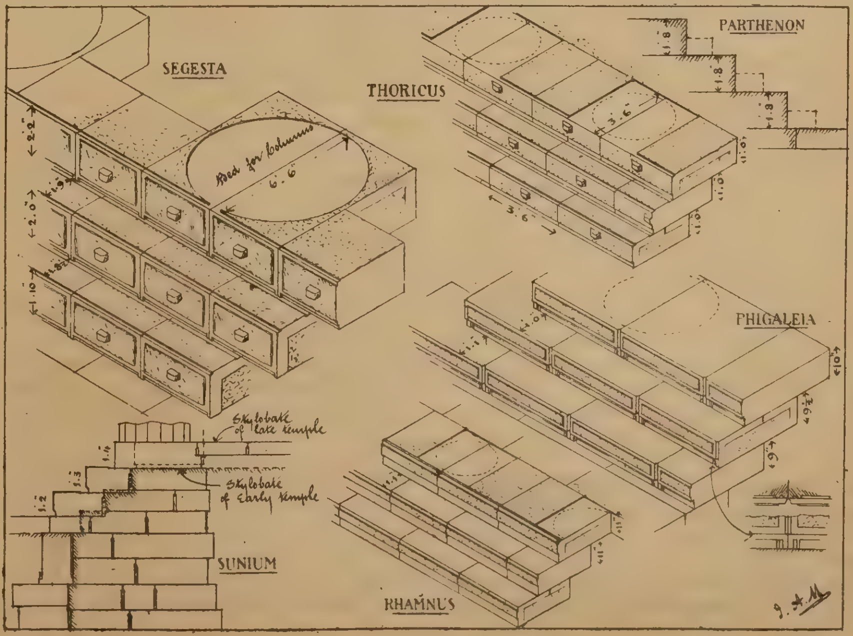
Barnsley.

Dear Sir,—Delph stone as known in the West Riding is a very fine grained ashlar, generally of a grey or blue colour, weathering well, mostly very hard and taking a fine face when polished. It is found in many districts, but perhaps one of the best varieties is that obtained from the Green Moor Quarries, near Sheffield. It is largely sawn up and used for superior landings, flagings, &c., as well as for monumental work, but rather bad to work and liable to change of colour after fixing.

Geologists generally classify this species of stone with flagstone strata, but only the top lifts can be riven into flags, and they are very rough. As your correspondent of the 16th inst. says, a quarry is called a delph in some parts, but generally the term only applies to the quarries where this Delph stone is obtained and not to the ordinary sandstone quarries.

I suppose the word is derived from "delve," to dig, and in a good many localities the stone is found very near the surface, so that by digging it is uncovered.—Yours faithfully,
George W. Swift.

Professor Banister Fletcher's Will—Professor Banister Fletcher, who died on July 5, aged 66, has left estate which has been valued at £75,813 gross, including personalty of the net value of £39,165. The whole of his property was bequeathed to his wife absolutely.



Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor.

PIER BUILDING.

To the Editor of THE BUILDERS' JOURNAL.

OLD CHORLTON.

SIR,—I am very much interested in the article on Pile Driving, by Mr. Ellis, in your issue of the 9th inst. Could you kindly refer me to any volume in which wooden pier building is treated?—Your obedient servant,

J. M.

We do not know of any book on wooden piers. It is possible that a paper on the subject might be found in the Proceedings of the Institute of Civil Engineers. The volumes containing these Proceedings might be consulted at a public library, or they could be obtained from Batsford, 94, High Holborn, London.

"FATIGUE" OF MATERIAL.

To the Editor of THE BUILDERS' JOURNAL.

LIVERPOOL.

DEAR SIR,—Will one of the members of your staff kindly answer the following question taken from a recent exam. paper: Explain the terms "fatigue of material," "deflection," and "permanent set," and point out their bearing on carpentry work. I would be pleased to know if there is any book which deals with the fatigue of materials used in the building trade, as I do not find the matter mentioned in the building trade text books?—Yours faithfully, STUDENT.

There is a temptation to enquire what building trade text books our correspondent has consulted. At any rate he will find a definition of each of the terms mentioned in the Glossary attached to "Specification," price 5s., from these offices. We would also refer him to "Building Construction" (commonly known as "Rivington"), especially Vols. 3 and 4.

G. A. T. M.

PREVENTION OF DOWN DRAUGHT.

To the Editor of THE BUILDERS' JOURNAL.

LANCASTER.

DEAR SIR,—I should be obliged if you could inform me what is the best method of stopping down-draught in a straight flue; if by means of a "patent pot," which is the least unsightly but at the same time effective? At present the flue is surmounted by a red cone 20in. high. Also which do you consider the best appliance for curing a smoky flue not necessarily straight?—Yours truly,

SMOKE.

Your correspondent gives no clue as to the cause of the down-draught, but I presume in this case that the flue is one of several in one stack, the top of which is carried well above the ridge of roof, and the trouble may be caused by the tops of the red "cones" being all on one level. If this is the case a simple remedy would be to fix pots about a foot higher on every alternate flue. The nuisance may also arise from the flue not being gathered sufficiently up into the throat of the chimney; this is a frequent cause of trouble. The down-draught may be caused by cross currents from an adjacent building, or the proximity of trees, in which case I would recommend an anti-down-draught top with syphonic action as the only means of curing this, whether the flue is straight or otherwise.

E. P. M.

WORKMEN'S COMPENSATION ACT AND HEIGHT OF BUILDINGS.

To the Editor of THE BUILDERS' JOURNAL.

HANLEY.

DEAR SIR,—I shall be obliged if you will give me the rule followed by surveyors in determining the height of a building for the purpose of the "Workmen's Compensation Act."

Would a surveyor be entitled to include a cellar or a chimney, either one or both, in his measurements in obtaining the height? If not, kindly inform me what would be the correct course to adopt?—Yours truly,

R. W.

The Act does not contain any definition of the word "building," or of the word "height," nor has there been, so far as I am aware, any decision upon the meaning of either. In the only case in which any question as to "height" arose—Billings v. Holloway (1899) 1 Q. B. 70—it was apparently assumed that the height was to be measured from the ground. The London Building Act (1894), sect. 5 (21), defines "height" in relation to any building, to mean the measurement taken from the level of the footway (if any) immediately in front of the centre of the face of the building, or, where there is no such footway, from the level of the ground before excavation, to the level of the top of the parapet, or where there is no parapet to the level of the top of the external wall, or (in case of gabled buildings) to the base of the gable. But these provisions are made with a view to prevent the obstruction of light and air; while those of the Workmen's Compensation Act are made for the purpose of relieving workmen injured by accidents, and I think therefore that the height, for the purpose of this Statute, should be measured to the highest point to which the structure reaches (and should therefore include a chimney) from the lowest level to which a workman could fall, or to which anything could fall on him (and would therefore include any excavated space which remained exposed down to the foundations—*e.g.*, an area or an open cellar). But in the absence of definition or judicial decision, this is merely the view of counsel, who may of course be mistaken. I may mention the "height" is the *actual* height which the building has attained at the time of the accident, and not the *intended* height.

H. P. B.

ARCHITECTS' CHARGES.

To the Editor of THE BUILDERS' JOURNAL.

DROGHEDA.

DEAR SIR,—We have a building at present in hand the contract for which expires on the 1st prox., but the building is not nearly finished as yet.

The delay in completing the works up to time is due partly to additional or extra work, and partly to the fact that the plastering and other works have been retarded through the public board for whom the works are being carried out, making considerable delays in deciding upon a lighting scheme, and in deciding the contract in connection therewith.

The contractor (although an excellent man) has taken advantage of these circumstances to give his attention to other important contracts, knowing that the majority, if not the whole board, is friendly to him.

He did not, at any time, cease work altogether, so that our fortnightly visits had to be paid as regularly as if the job had been fully manned. It will take at least six months to complete the job. We shall be kept out of our commission all that time as well as having to be at considerable loss of tim in travelling, hotel, and incidental expenses. Are we not entitled to be paid for extra time, travelling and incidental expenses?

In notifying the Board as to expiration of the contract and recommending that the contractor be given an extension of time, should we not at the same time give notice of our intention to apply for extra remuneration in connection therewith?—Yours faithfully,

HIBERNIAN.

The right to additional remuneration depends upon the special contract, if any, between the parties. If there be no special contract, the amount of remuneration will depend upon these extra services as well as all other services rendered, the remuneration being "reasonable" all circumstances considered. There will be no harm in giving the proposed notice.

H. P. B.

. . A NEW . .

TRADE JOURNAL

(ISSUED TO SUBSCRIBERS ONLY).

There will shortly be published, from the offices of the BUILDERS' JOURNAL AND ARCHITECTURAL RECORD, a trade journal for all interested in Furniture, Decoration, Upholstery, Art Metal Work, Stained Glass, Ironmongery, Brassfoundry, Electroplate, and Art Pottery.

THE FURNISHER,

as the new journal will be named, will be produced in a style never before attained by any trade journal. The paper and printing will be of a superior quality, and the illustrations will be reproduced in a style similar to those in the ARCHITECTURAL REVIEW and other high-class Magazines.

THE FURNISHER will contain articles by

Acknowledged Experts

in their respective trades, and will illustrate the work of the most eminent designers and manufacturers. The subjects treated will include all branches of the furnishing trades, and the journal will be, in fact,

Seven Trade Journals in One.

Suggestions of the greatest practical value to all engaged in the trades, whether manufacturers or retailers, will be given

All trade news will appear in THE FURNISHER, new inventions will be noted, new books reviewed, and questions of interest discussed. Commercial information will be given in detail, and the journal will be indispensable to every person who designs, manufactures, sells or buys what goes to the furnishing or decoration of either public building or private house.

THE FURNISHER will be published monthly, price 6d., but will only be obtainable by Subscribers, who must be connected with the Trade.

Offices:—Effingham House,
Arundel Street,
Strand, London.

OLD DOORWAY IN QUALITY STREET, LEITH.

THE ARCHITECTURAL ANTIQUITIES OF LEITH.*

By JAMES CAMPBELL IRONS, M.A.

(*Concluded from page 40, No. CCXXXVII.*)

THERE is a very interesting door in Quality Street forming a sort of connecting link between Mediæval and Renaissance. The architrave has the shoulders of the Renaissance very pronounced at the lintel, while the mouldings and the O. G. curve in the centre are reminiscences of the older style. It is dated 1710.

In the same street is the house illustrated on this page; it is a good example of old Scottish domestic architecture. In this house Charles II. is said to have been entertained in 1650.

Near the top of the Tolbooth Wynd an ancient tower stands. It is furnished with little port holes at the top resembling those designed for musketry in our old Border peel-towers and fortalices, but which were constructed here, we presume, for the more peaceful object of watching the owner's merchant vessels as they entered the Firth. An unusually striking piece of sculpture in very bold relief occupies a large panel over the archway leading into the courtyard behind. It bears the date 1678, and amongst sundry other antique objects the representation of a singularly rude specimen of mechanical ingenuity. This consists of a crane, the whole machinery of which is comprised in one large drum or broad wheel made to revolve like the wire cylinder of a squirrel's cage, by a poor labourer who occupies the quadruped's place, and clambers up, Sisyphus-like, in his endless treadmill. The perspective with the grouping and proportions of the whole composition forms altogether an amusing and curious sample of both the mechanical and the fine arts of the seventeenth century.

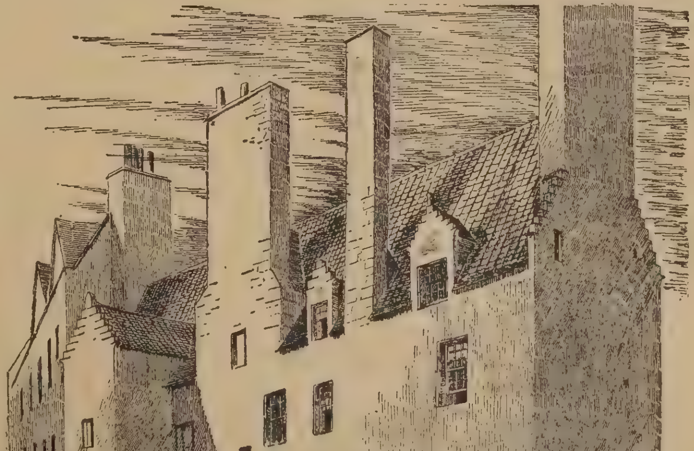
The little building shown on the lower right hand corner, which resembles in its proportions the eastern wing of Aberdeen Castle, is doubtless a view of the porter's lodge or home. It is dated 1673, and bears the letters "C. R.," which, no doubt, meant Charles Rex, who was more than once resident in Leith, and played golf on its links. Two boats with a mast each on the bows are shown, and on the side of the boat is a curious oval cartouche containing what looks like a man on horseback, and beneath the pennant are the initials "C. R.," and on the other the St. Andrew Cross.

The Tolbooth Wynd is probably the second oldest thoroughfare in Leith, and was that which superseded Burgess Close as the approach to the shore. Midway down this stood the Old Tolbooth, erected in 1565, in the reign of Queen Mary. It appears that the magistrates "for a long time denied the Leithers even the luxury of possessing a jail of their own," but the latter having enlisted the sympathies of Queen Mary, she wrote several letters on the subject to the town council—without effect, however. At last, in 1563, she wrote in peremptory terms:—"Wherefore we charge you that ye permit oure said toun of Leith, to big and edific our said hous of justice, within our said toun of Leith, and make no stop or impediment to them to do the samyn, for it is our will that the samyn be biggit, and that ye desist from further molesting of them in time coming, as ye will answer to us thereupon." This had the desired effect, and the building was proceeded with. The edifice was a good specimen of its class, and served its purpose for 250 years. On the upper part of the façade was placed, in recognition probably of her services, the arms of Scotland, with the initials of Queen Mary, bearing the inscription and date in large Roman characters, "M. R. In Defens 1565," with supporters, two unicorns, and pennants having salteres.

"Soon after the demolition of the Heart of Midlothian," says Wilson, "the doom of the ancient Tolbooth of Leith was pronounced, and plans were procured for a new court house and prison. Great exertions were then used by several zealous antiquaries, and particularly by Sir Walter Scott and Charles Kirkpatrick Sharpe, Esq., to induce the Magistrates of Edinburgh, under whose authority the work proceeded, to preserve the picturesque and venerable façade, while the remainder of the building could be demolished and rebuilt according to the proposed plan. The proposition was treated with the usual good taste of our civic reformers. A deputation who waited on my Lord Provost to urge their petition were cavalierly dismissed with the unanswerable argument that the expense of the new designs had already been incurred, and so the singular old house of justice of Queen Mary was replaced by the commonplace erection that now occupies its site." This nondescript building, totally unfit for its purpose, was afterwards converted into shops and offices.

What is called the "Shore," or Quay of Leith, extends from the Tower southward to the foot of the Tolbooth Wynd, and contains many quaint old buildings. A view is given of the door and staircase window of No. 10, which bears the date 1678, with the initials "R. M." No. 28 is the Old Ship Hotel, and No. 20 was the New Ship Tavern, the lower flat of which is shown in the Rotterdam view of 1700 exactly as it is now. Above its doorway can be traced a Latin motto from Psalm cxxvi, ingeniously adapted to the calling of the house: *Ne dormitat custos tuus. Ecce non dormitat neque dormit custos domus.* "He that keepeth thee will not slumber. Behold he that keepeth the house (Israel) shall neither slumber nor sleep."

One of the finest specimens of seventeenth or early eighteenth century architecture still surviving in Leith is that of a doorway on



HOUSE IN QUALITY STREET, LEITH.

---

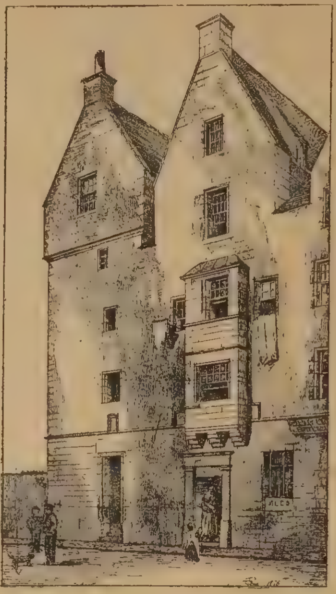
* A paper read before the Edinburgh Architectural Association on March 8th, 1899.

the Shore. The letters forming the monogram are "J. G." and "B. M.," which might be the initials of John Gladstone and his wife. The date 1711 is carved on the pediment. This suggestion is made because his place of business was in the immediate locality.

Another house on the Shore is a very early and good example of the Renaissance architecture of Scotland, when the native genius was completely crushed out and the foreign style of the time adopted. The period to which it belongs is the close of the sixteenth century or opening of the seventeenth century. It was one of the finest specimens in the country of pure Renaissance architecture, and, I regret to say, has been demolished to give place to the common tenement prevalent today.

There is an old house in Water Lane which still happily stands. Those interested in ancient Scottish architecture should take an early opportunity of seeing it. It is hoped that someone will make a measured drawing of it. It presents a gable to the south, and the splaying and angling of corners, so much indulged in by the sixteenth and seventeenth century architects, the sort of thing which reaches its culminating effect in Anniesfield Tower in Dumfriesshire, has been here given effect to in full with much ingenuity. It is probably the finest specimen of old architecture in Leith.

The ground on which the chapel and the neighbouring tenements were erected is styled in a charter of Queen Mary, dated 1559, "the liberty of the north side of the Water of Leith, commonly called Rudeside," a term attributable to its connection with the Abbey of Holyrood. The remains of the chapel still occupy the ancient site on the banks of the Water of Leith, but very little of the original structure is in existence, probably no more than a meagre portion of the basement wall on the north side, where a small doorway, with an elliptical arch appears, now built up and partly sunk into the ground. The remainder of the structure cannot be earlier than the close of the sixteenth century, and the date on the steeple is 1675. It is the same kind of tower as adorned Glasgow College, and is to be found on the town house of Dumfries, erected by Banck, a well-known architect of this period. He erected the tower of Dumfries, and probably designed this also. He was a native of Alloa. A large sculptured lintel belonging to the edifice has been rebuilt into a more modern tower of the church, erected apparently in the reign of Queen Anne.



COUNCIL CHAMBER OF LENNOX, MAR AND MORTON ON COAL HILL.

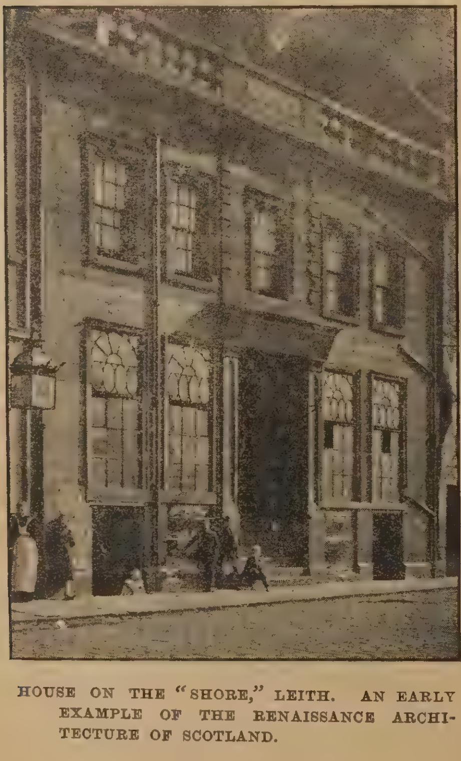
By the charter of Queen Mary, which confirmed the rights that had been purchased by the inhabitants from Lord Holyroodhouse, the chapel of St. Ninian was erected into a church for the district of North Leith, and endowed with sundry annual rents and other ecclesiastical property, including the neighbouring chapel and hospital of St. Nicholas and their endowments. An Act of Parliament was obtained in 1606, creating North Leith a separate and independent parish, and appointing the chapel to be called in all time coming the "Parish Kirk of Leith benorth the brig." Dr. Robertson says that when Dr. David Johnston was called to be minister of North Leith, he entered into an arrangement with the session without any consent on the part of the inhabitants, by which he vested himself and his session as trustees of the parish in the management of the funds. In 1812, when the new church of North Leith was being built, the session and incorporations of the assumption of this agreement, entered into a mutual engagement, the grounds whereof were revived so recently as 1828, when a submission was made to Sir James (afterwards Lord) Moncrieff, then Dean of Faculty, who gave an opinion that matters should not be disturbed, assuming the arrangement to be binding on the parties at the time; and such is the position of matters at the present day.

On the 19th August, 1561, Queen Mary arrived with her two vessels in Leith Roads at 7 a.m. of a dull day. She was accompanied by her three uncles of the House of Guise, the Duc d'Aumale, Monsieur d'Amille, her gentlewomen, called the four Maries, Stroyzi and Brautome, and many persons of less note. She was received on her landing by the Lord James, her natural brother, and many of the chief nobility.

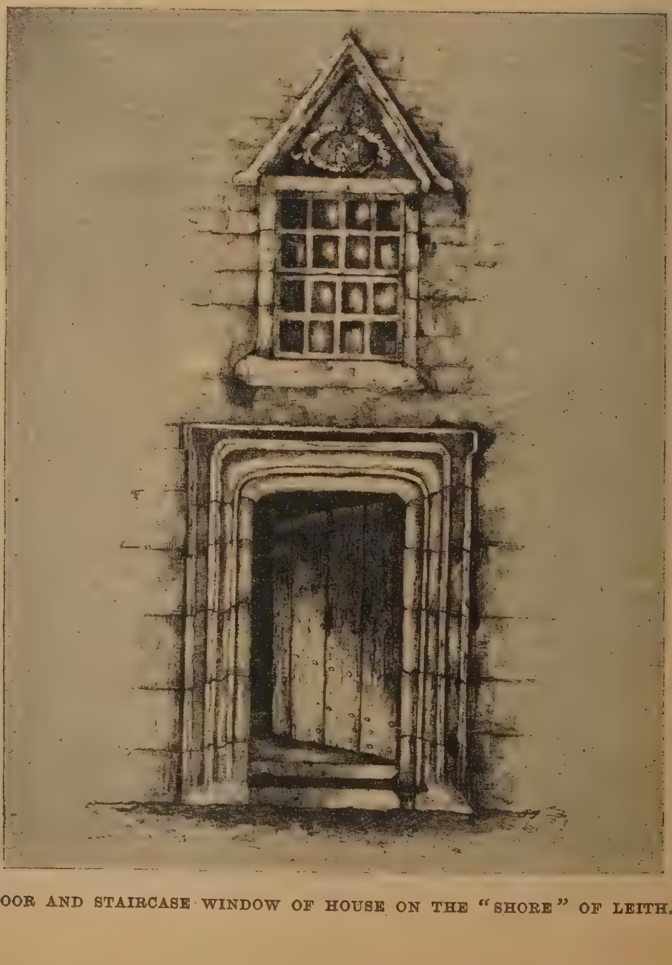
On the 22nd of August the Earl of Moray was proclaimed Regent. On the 23rd January, 1570, he was shot by James Hamilton, of Bothwellhaugh, in the streets of Linlithgow; he was immediately taken to the palace, where he died at midnight. His corpse was conveyed to Stirling, and thence by water to Leith, and afterwards brought to Holyrood House. His funeral took place on the 14th of February in the High Church of St. Giles, where he was buried in St. Anthony's aisle.

His successor in the regency was Matthew, Earl of Lennox. He established his headquarters at Leith, and his council chamber in the old tenement on the Coal Hill. It was decorated with a rose, the emblem of his connection with Henry VIII. of England, and the thistle for Scotland.

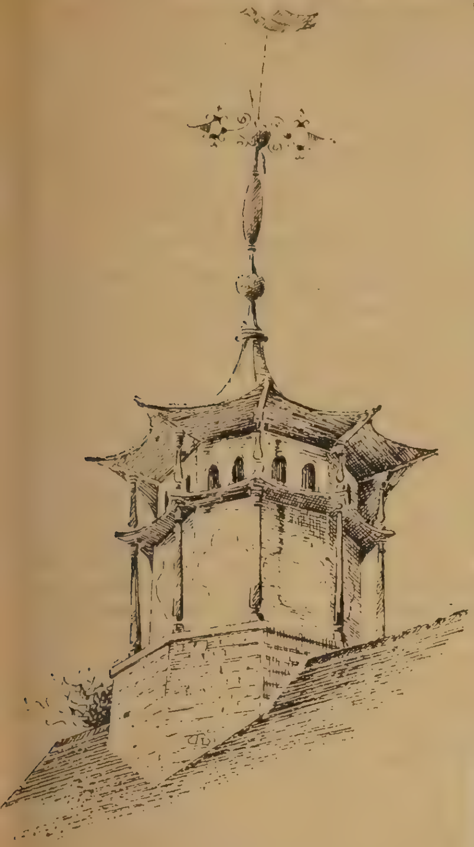
A difference of opinion existed with reference to the precise situation of this council chamber, but Dr. Robertson, who took great pains to ascertain the truth about the matter, remarks:—"This building—the council chamber of Lennox, Mar and Morton—is situated on the 'Coal Hill,' and is even now not so inferior in external decorations as to make it in any way contemptible to the antiquarian observer. In its 'bright and palmy days' it must have been something far above the general class of buildings. I have compared



HOUSE ON THE "SHORE," LEITH. AN EARLY EXAMPLE OF THE RENAISSANCE ARCHITECTURE OF SCOTLAND.



DOOR AND STAIRCASE WINDOW OF HOUSE ON THE "SHORE" OF LEITH.



DOVE-COT ON A HOUSE IN LEITH.

it more especially with Lady Stair's celebrated house, and others in the High Street of Edinburgh, and have little hesitation in giving it the preference. It is not now to be seen in the same condition in which it was in 1835, when its interior, although divided and subdivided, still gave indications of former grandeur, sufficiently artistic to induce admiration. The 'Peak Neux,' or Parliament Square, due south of this tenement, has, in modern times, been called Lennox's Council Chamber and Queen Mary's abode. These illusions we are necessarily compelled to dispel, as we are creditably informed that the ornate and highly decorated cornices in these now miserable tenements were executed under the order of a shipmaster of the name of Maclure about the year 1775, or a little later." The old council chamber of Lennox was removed some years ago in accordance with a scheme of improvement.

This house, which was very lofty, had a commanding aspect and gave a most dignified look to the whole locality. It was divided into two lofty gables, surmounted with chimneys which were not mere imitations of each other but differed in their detail. There is a very fine projecting window supported on corbelling and carried up two storeys. The thing most like it now in Scotland is to be seen in the north side of Linlithgow Palace. The house, which latterly fell on evil days and evil times, was finely furnished in the interior with a good deal of delicately moulded woodwork. There was hardly anything better of its class in Scotland. It was demolished only about ten years ago.

According to Maitland, "Mary of Lorraine, having chosen Leith for her residence, erected a house at the corner of Quality Wynd in the Rotten Row, but the same being taken down and rebuilt, the Scottish arms, which were in front thereof, are erected in the wall of a house opposite thereto, on the southern side." (Book VIII., p. 496.) Robertson says: "With Maitland, whom we have found more correct than other observers of his day, we are inclined to believe that the site of this building was in Water Lane or 'Rotten Row,' where the northern portion of the tobacco warehouse presently stands. The only existing relic of the palace is in the writer's possession—the elegantly sculptured arms of the house of Guise, quartered with those of Scotland. This stone was long preserved in the Old Tolbooth. On its demolition, the materials, with the Scottish arms of Queen Mary, were sold to the contractor, but an attempt was very creditably made by the authorities of Leith to preserve these memorials, and I have been told that our late much respected provost, James Reoch, Esq., succeeded in 1820 in effecting their recovery, he being at that time one of the bailies. They were thereafter deposited in a slaughter-house behind the New Tolbooth, and were afterwards carried to a warehouse in Bernard Street, where they remained until 1844, when they were accidentally discovered at the very moment that the stones were under the blow of the mason's hammer, to furnish material for building the partition wall of a cellar." The two stones were rebuilt by Dr. Robertson into the original window of St. Mary's Church, which was purchased by him on the alteration of the church, and were re-erected at his residence in Albany Street, North Leith.

The extremely picturesque Dove Cot, shown on this page, is situated in one of the most uninteresting streets in Leith. And yet it would be difficult I suppose to design anything more appropriate for its purpose. It is built of wood with lath and plaster. There is a broad-shaped shelf for the birds all round, supported by elegant slim-turned balusters, and above this a wide projecting roof imitating and repeating, but on a slightly larger scale the shelf, and from this a curved roof sweeps up and grows into a most handsome finial. It is a mere trifle, but it has that complete mastery about it which appears to be so prominent in the woodworks of Japan and China.

Cemetery Extension at Dalry.—At a special meeting of the Parish Council on Tuesday last week, the offers for the work in connection with the cemetery extension were considered. It was decided to accept the offer of Mr. Edward M'Corvie, of Kiluruning, amounting to £1,012 9s., exclusive of rock-cutting.

A New Technical School at Louth was opened on Thursday. The building is in Queen Anne style of architecture. On the ground floor are two spacious lecture rooms, measuring 27ft. by 17ft.; also a room for manual instruction, the dimensions being 27ft. by 19ft. There is also the head master's room and various offices. Upstairs is the art room, measuring 41ft. by 27ft., which is lofty and admirably adapted to the purposes; there are also a chemical laboratory, 26ft. by 13ft., and a lecture room for chemistry and electricity, 27ft. by 19ft. The contractors are Messrs. Mawer Bros. The total cost of the building is about £1,452.

ST. NINIAN'S CHAPEL, NORTH LEITH.

Bricks and Mortar.

Aphorism for the Week.

"No man is born into this world whose work is not born with him; there is always work, and tools to work withal, for those who will."—James Russell Lowell.

The Royal Exchange Frescoes. The offending advertisements at the Royal Exchange will shortly be no more. We called attention last week to the incongruity of advertisements being cheek by jowl with works of art. The Gresham Committee evidently recognises the incongruity, and has now definitely decided to abolish all the advertisements. Many of them have already been removed. Of course, some of the advertisers who hold long contracts will have to be negotiated with, but it is hoped that an understanding will be arrived at, by which the advertisements may be removed at an early date.

A Wall Paper Combination. Rumours of the formation of a syndicate of wall paper manufactures have been afloat for some time, but it was only recently that clearer information could be obtained on the subject. Those interested in the wall-paper industry know that wall paper, especially the common kind, has been very cheap lately. This has caused the wall paper manufacturers to establish a trust on American lines with a capital of £3,000,000, and a notice has been issued to all dealers throughout the country to the effect that after the 26th inst., no goods will be supplied until the syndicate has commenced its operations. One of the principal objects of the combination will be to put an end to ruinous competition, as it is a well-known fact that manufacturers have endeavoured to out-do one another by flooding the country with cheap paper, the bulk of which was produced at a loss. The syndicate intend, so they say, to make an endeavour to raise the standard of English wall papers by the introduction of more artistic work. There will be no attempt, they say, to unduly force up prices. There can be no doubt that the price of the cheaper papers will go up, and when this happens foreign manufacturers will most likely step in, and by adapting themselves to English requirements will probably break up the combination.

Cost of Workmen's Dwellings. Mr. Graham, the Secretary of the Jarrow Co-operative Society, made some important statements at a meeting recently held under the auspices of the Land and Labour Committee. Mr. Graham stated that the ordinary dwelling houses, suitable for workmen, built by his Society, cost £355 each, while similar dwellings built by contractors were erected for about £255, or £100 less than the co-operators are required to pay. The high price of the houses built by the Co-operative Society, it should be noted, is entirely due to the cost of labour. The co-operators can purchase material on the same terms as the ordinary contractor. According to Mr. Graham, the reason why the co-operators are bled to the extent of £100 per house is that the workman will not give the same value of work per day to the Society as he will, or rather must, give to a private employer. As a provincial contemporary remarks, Mr. Graham's statements are worth the attention of the members of other co-operative societies who have engaged in building operations. It would be interesting to know whether his experience is a usual or an exceptional one.

The Cromwell Statue. Mr. Thorneycroft, R.A., is now putting the finishing touches to the bronze statue of the Lord Protector, who is represented in a standing position and wearing the undress military uniform of the Commonwealth. The work upon the monument in Westminster Hall Gardens is proceeding rapidly. The pedestal is of Portland stone, and reaches a height of about 10ft., the top being level with the adjoining roadway. It is not yet settled when the unveiling ceremony will take place, although it would be appropriate if the event occurred before the end of the year 1899—the tercentenary of the birth of Cromwell. The statue is pronounced to be an excellent likeness and work of art.

Cromwell's Appearance. Although Cromwell is one of those few characters in history whose personality is well known from his portraits, yet it is curious to note how different was the effect produced by his appearance upon his partisans and his enemies. Notwithstanding that portraits of the Protector abound, either in paintings, engravings, or sculpture, yet the genuine likenesses of the man can be reduced to three types. According to Mr. Lionel Cust, Director of the National Portrait Gallery, it seems certain that only three painters can lay any claim to have drawn Cromwell from life—Robert Walker, Sir Peter Lely, and Samuel Cooper. As to sculpture, it is impossible to point to any bust or statue of the Protector which could have been executed from life or during his lifetime. After the Restoration there was a great revival of energy among artists, and decorative sculpture came into demand. Edward Pierce produced a bust of Cromwell, of which there is a terra-cotta model in the National Portrait Gallery. This bust was long believed to have been taken from the life, but as a matter of fact Pierce was not working until twenty years after Cromwell's death. The marble bust recently presented to the House of Commons has been ascribed to Bernini, but he, it is stated, never came to England, and could not have seen the Protector. With the portraits may be classed the so-called death-masks, of which more than one exist.

The Parish Church at Usk. The old priory church at Usk has in it little of the original Norman fabric. The tower that once rose from the centre of the pile now stands at the east of the church, and the formerly surrounding choir and transepts have gone. There is still, however, a fine gatehouse close to the churchyard, but this, with the exception of a few traces, is all that is left of the old buildings. It has been recognised that the church needs repairing, and a local Restoration Committee have taken the matter in hand. Mr. G. E. Halliday, F.R.I.B.A., has reported that the tower, one of the few early Norman examples remaining in the diocese, is fast falling into decay, so much so, in fact, that should the work of reparation be deferred the necessity of introducing new masonry will in a great measure detract from the feeling of the old work, which is now practically in its entirety. The aisle and nave roof are also sadly in need of repair. This work, as well as that of removing the somewhat extensive casing of plaster, will, on a moderate estimate, cost the Restoration Committee £1,300. It is intended to leave the restoration of the choir and transepts until the above mentioned work is done.

Vandalism at Newcastle. It is encouraging to see signs of a growing interest on the part of the non-professional press in matters which concern the beautifying or spoiling of the city. The "Newcastle Daily Chronicle" bemoans, with some cause, the scheme for the erection of "a series of brackets surmounted by a network of live wires," by the New Tramways Committee of the Corporation for the purposes of the overhead trolley system. It mentions about thirty streets which are to be "improved out of recognition," and then sarcastically remarks that it "can only hope that the work of transformation will be commenced before November. It was stated at the last meeting of the committee that no outside work could be undertaken before March. That is nonsense. There is nothing whatever to prevent the Council surrounding Grey's monument with poles and wires at once. Why should not that be done experimentally, and enthusiasm for the Corporation's tramway scheme be thus aroused?"

The William Black Memorial Beacon. It is intended to erect a beacon as a memorial to William Black at Duart Point, Oban, overlooking the waters and the country which are associated with some of his best work. The beacon will be placed on a simple-looking battlemented tower. The Americans are taking an interest in the memorial, Mr. R. R. Fowler, of New York, having promised to make up the amount required to £800, that is after the English subscriptions are all in. Lord Archibald Campbell is the treasurer of the fund and receives subscriptions at Messrs. Coutt's, 59, Strand, W.C. The sketch-design for the Beacon Tower will be more complete when a cresset of the proper form surmounts it.

Country Building By-Laws. How to build a wholesome dwelling at the lowest cost is a problem of national importance, says Mr. G. V. Poore in a letter to the "Times." It will be good news to many to hear that the Local Government Board appears to be ready to sanction a modification of its model by-laws by those bodies which have adopted them, in so far as they prohibit habitations built of wood. But the conditions which the Board seeks to impose upon the builders of wooden houses are somewhat arbitrary. These conditions are:—(1) That the house shall be of one storey only; (2) that its area shall not exceed 600 square feet, nor its capacity 6,000 cubic feet; and (3) that it shall be 200ft. distant from any other building not being in the same curtilage. Conditions 1 and 3 are presumably intended to lessen the risks of fire, which might very well be left to be settled by the owner and the insurance office. The object of condition 2 is not so obvious, and one is curious to know why a wooden cottage with an area of 600 or more feet is to be absolutely disallowed. Condition 3 means that every wooden cottage must stand in about half an acre of ground, while a quarter of an acre has been pronounced by high authority to be the maximum which a man can cultivate in his leisure. The complete want of elasticity in these regulations is very characteristic, and they afford an interesting illustration of the official idea of local self-government. If we are to encourage rural life, it is important not to restrict unnecessarily the use of rural products for building purposes. Local councils which have not adopted building by-laws should certainly pause before doing so.

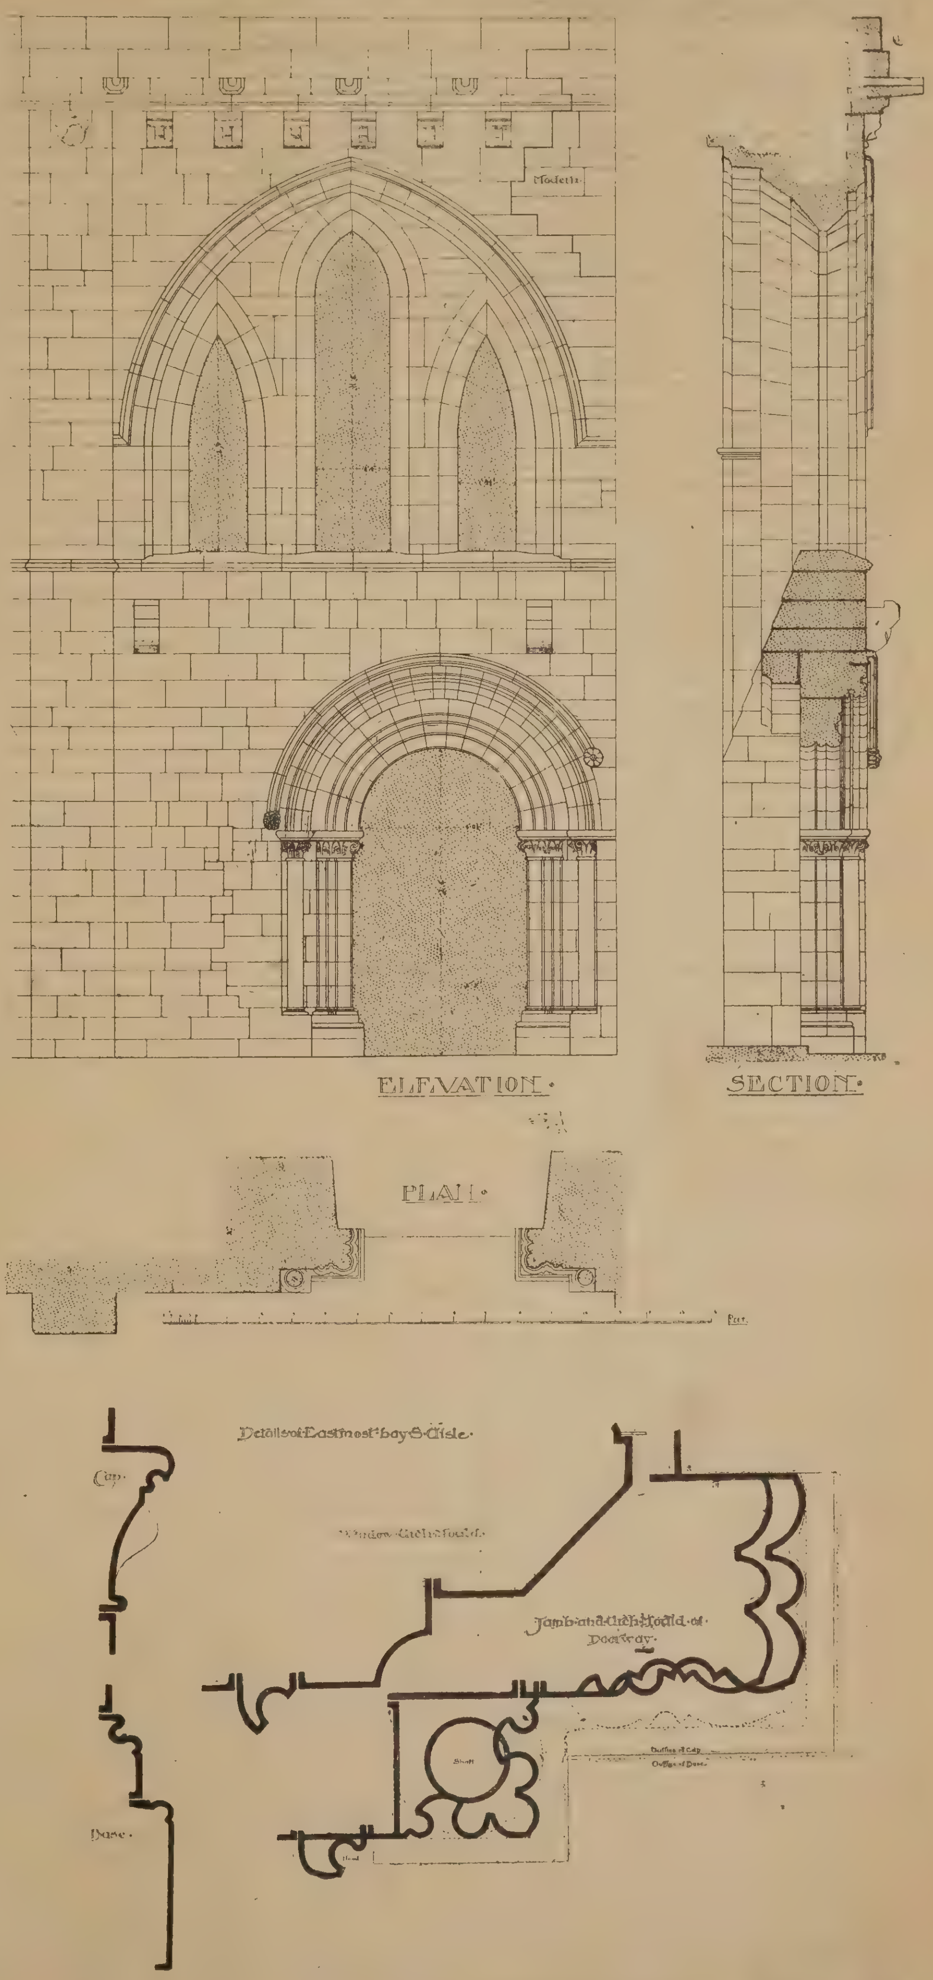
The Improvement of Westminster. The demolition of buildings in Westminster still goes on, and King Street is now closed. The unmarried police, who were lodged in the section house at the back of the old King Street Police Station are to have temporary sleeping accommodation in a large iron building which has been constructed in the forecourt of New Scotland Yard. The Science and Art branch of the Scotch Education Department has been removed from Great George Street to 55, Parliament Street, and the Light Railway Commission has been removed to 54, Parliament Street. The site for the new police station in Cannon Row, upon which the Civil Service Commission building formerly stood, has been cleared, ready for building operations.

The Black Smoke Question. At a meeting of the St. Helen's Corporation Health Committee on Wednesday afternoon, the question was raised as to how long black smoke should be allowed to be emitted from chimneys before a prosecution of the owners of the chimneys was begun. Reports had been presented to the Committee which stated that black smoke had been issuing from certain works for more than five minutes at a time. Alderman Sir David Gamble considered that a five minutes' test was unfair, because it only allowed the same time for a chimney with thirty or forty furnaces as it did for a chimney with only a few furnaces. There was also the question whether the manufacturers where doing their best to abate the nuisance or not. The chairman, Alderman J. Foster, remarked that a five minutes' test was the usual one, and that none of the reported chimneys had more than ten furnaces. Councillor Burchal called attention to the fact that one of the chimneys concerned was that at the Corporation's destructor works at Boundary Road. He suggested that they should look after themselves before dealing with others. The committee evidently thought it prudent not to go any further into the subject, and it was dropped.

Paisley Abbey. The illustrations of Paisley Abbey, here reproduced, are from two sheets of measured drawings by Mr. James S. Boyd, a student in the Architecture Class of the Glasgow and West of Scotland Technical College. Mr. Boyd is a journeyman joiner, who desires to become a clerk-of-works, and these drawings were executed under the superintendence of Professor Gourlay, who is of opinion that such work is of great importance as part of the training of a craftsman for the position of a clerk-of-works. They represent the doorway and window which form the easternmost bay of the south aisle of the nave of the abbey. The doorway led into the cloister, which was pulled down by the municipal authorities several years ago, so as to widen the adjoining street. The roof of the cloister was supported on the corbels which are seen above the door, in the elevation and section. The arch of the door is very nearly a semicircle. This part belongs to the oldest portion of the abbey.

The Old Gate Tower of Lincoln's Inn. The old gate tower in Chancery Lane, one of the few remaining ancient landmarks in London, is now undergoing renovation and repair. The work is being carried out under the direction of Mr. Dennett H. Barry, the surveyor to the Honourable Society of Lincoln's Inn. About 4ft. of stone coping and parapet walls of the two towers facing Chancery Lane will be taken down and the brickwork will be repointed. The original old oak gate will also be repaired. Great care is to be taken that no structural alteration or change will be made in the appearance of the tower, which is stated to be structurally strong. The tower was built during the reign of Henry VII., and in the rooms over the gateway Oliver Cromwell is stated to have once occupied chambers. The wall of Lincoln's Inn was commenced in the reign of Queen Elizabeth, and it is said that Ben Jonson worked thereon as a mason. Prior to the erection of this wall, the site of which is now occupied by chambers, Lincoln's Inn was separated from Chancery Lane by an embankment only.

Unlucky Birmingham. St. Laurence's Church, Dartmouth Street, Birmingham, has long been in need of the repairs and alterations it is now receiving at the hands of Messrs. Franklin, Cross and Brookes, architects, but it was not known until last Wednesday that the whole floor of the church is rotten. The workmen in the progress of excavation actually found the joists reduced to fine powder. The reason for this is that no ventilation was allowed for when the church was built. A very heavy item of expense will now be added to the contemplated cost of repairs, and it is to be hoped that the Birmingham Churches Fund will be able to make some grant towards the effort now being made to put the edifice into thorough repair, as the vicar and churchwardens cannot proceed with the contract work until the floor has been put right. St. Laurence's has only been built about thirty-five years, and yet its iron work in that time has been corroded and eaten away by the acids in the neighbourhood. We wonder how many more Birmingham churches are in a like condition.



A DOORWAY AND WINDOW AT PAISLEY ABBEY. MEASURED AND DRAWN BY JAMES S. BOYD.

Professional Practice.

Aberdeen.—A commencement has been made on the work of pulling down the greater part of Glenkindie House, belonging to Captain Leith, preparatory to the erection of a new house on a larger scale. The only parts of the present building to be retained are the two small wings at the right and left of the front. The main block to connect these, with its ornamental spurs and projecting wing at the back containing the kitchen and attendant accommodation, is to be rebuilt from the foundation. The building will be embellished with various effective architectural features—projecting oriels at certain points and baronial towers rising in front at the intersection of the front wings and main block. The main building will be three storeys in height. Some small portions will be of two storeys, and the kitchen wing will be one storey. The new building will be constructed principally of the freestone that abounds in the Auchindoir and Rhynie districts. The contract for the mason work, which will amount to about £6,000, has been placed in the hands of Mr. Edgar Gauld, of Aberdeen. The contract for the joiner work, which amounts to nearly £3,000, will, it is expected, go to Messrs. M'Robbie and Milne, of Aberdeen. The architects are Messrs. Sydney Mitchell and Wilson, of Edinburgh. The entire work, which is likely to occupy about two years, is expected to cost from £12,000 to £14,000.

A new block has been added to the City Hospital from designs by Mr. John Rust. The extension is 76ft. from the north front to the junction on the west with the administration block. It is almost the same width, and the building encloses an open central area, by means of which a plentiful supply of light is obtained on the side for the block as a whole. In the centre of the north front is a campanile tower which rises four-square above the adjacent roofs, and attains, including the finial, to a height of nearly 50ft. The tower has a curve roof, covered with green slates and surmounted with an effective crown finial. From each side of the central tower the front stretches out, four windows on each side, on both floors, and the angles are marked by channelled ashlar pilasters, while an open granite balustrade forms a cresting along the top of the walls. The main south entrance of the administration block forms also an entrance to the new addition. One part of the extension—along the east side of the ground floor—is isolated from the rest of the block, and is reserved as an addition to the reception, bathing and discharge accommodation for patients. On the ground floor, along the west side, is a dining-hall for ward maids and four servants' bedrooms. Along the north front on this floor runs a series of three bedrooms for laundrymaids, joining at the north-east corner the isolated portion of the block. The accommodation on the upper floor is entirely devoted to bedrooms, &c., for nurses and others of the staff. The structural furnishings of the new portion are of pitch pine, and the corridors on both floors have a dado of the same wood to a height of 4ft. The lavatories, &c., are tiled. The contractors are: Mason, Mr. Leslie Smith; carpenters, Messrs. Leslie and Hay; plasterers, Messrs. J. Bannochie and Sons; plumber, Mr. John Anderson; slater, Mr. John Farquhar; painter, Mr. Philip, Huntley Street; bell-hangers, Messrs. Florence and Son; heating, Mr. R. Tindal. The furniture is being supplied by Mr. Wishart, cabinet maker. The cost is between £4,000 and £5,000.

Barrow.—A new Wesleyan Methodist church has just been opened in Abbey Road, Barrow. The church has a broad nave, two transepts, chancel, narthex organ chamber, choir vestry, ministers' vestry, and class-room, with a church parlour above to hold 130 persons, and having direct lift connection with a kitchen in the basement next the heating chamber. The main elevation is faced with Yorkshire parsepts, there are transept and end galleries, points and St. Bees red stone dressings. At the Abbey Road and Brighton Street angle of the church, a tower has been designed, containing the steps leading to the end gallery over the narthex, and surmounted by a spire rising about 100ft. from the ground. At the other angle an additional entrance without a porch is provided. The internal woodwork in roofs, ceilings, benches, screens, &c., is in selected pitch pine. The windows and screens are glazed with ornamental lead work. The entrances, narthex, and chancel are tiled. The church will be heated with hot water on the low pressure system, and the lighting will be by means of an electrical installation. In addition to the seats in the nave and tran- which altogether will provide accommodation for about 750 worshippers, including a choir of twenty-four in the chancel. On the left hand side of the church a school has been designed with infants' rooms and three class-rooms to seat 410 scholars, and about 685 for meeting purposes. The main school will be provided with a gallery at one end. The church has been built from the designs of Messrs. William Waddington and Sons, of Manchester, and the work has been carried out by local tradesmen.

Brighton.—At the Brighton County Court last Tuesday week, Judge Martineau heard a case in which Robert William Pollard, architect, of 11, Prince Albert Street, Brighton, claimed from Tom Bovey, licensed victualler, of the "Sir Richard Steele" Hotel, Haverstock Hill, London, £8219s. 8d. for architect's work in connection with the re-building of the Quadrant Hotel, Brighton. There was a counterclaim for £170 for alleged drunkenness and inefficiency. Mr. Matthews, for the plaintiff, stated that in May, last year, defendant acquired the Quadrant Hotel, Queen's Road, by purchasing the lease and had the premises, which were extremely dilapidated, practically re-built. To plaintiff was entrusted the work of preparing plans and specifications—a very delicate task considering the age of the building and the difficulty of planning how the new work should fit into the old. Plaintiff charged for preparing plans and preliminary work to go before the Building Committee of the Town Council, preparing tracings, interviews with solicitor, and attending before the Licensing Justices, and preparing plans for the work at 5 per cent. on the estimate (£1,639), a third being deducted on account of plaintiff being relieved of the supervision of the work. The question was whether the £82 19s. 8d. was a fair remuneration for the work done. The plaintiff said he carried out the work as stated by Mr. Matthews, but after a time was informed that his services were not required. He knew from what the defendant had told him that tenders were obtained upon his specification. Mr. Drury, for the defendant, said that no terms were arranged beforehand. The defendant stated that he told the plaintiff that he did not intend to spend more than £1,000 on the building, and the plaintiff distinctly said he would charge 5 per cent. inclusive on the accepted tender. He began to complain to plaintiff of the work being behind about the end of September. The plaintiff was, on many occasions when he came to take measurements, so intoxicated as to be unable to do so. Estimates were obtained on plaintiff's specifications, the lowest being £1,639, but the work was eventually done for £1,355. He estimated that through the delay that occurred he had lost something like £15 or £20 a week. Other witnesses were called to prove the alleged intemperance, which was denied by the plaintiff, and Mr. Drury submitted that there was a definite agreement—5 per cent. to cover everything—and that there had been most unreasonable delay. Mr. Matthews submitted that, even had there been a special contract for five per cent., it had been rendered void by defendant dismissing plaintiff, and that there was no case of delay. His honour held that the defendant had failed to prove the alleged intemperance. He did not think that plaintiff was remarkably diligent in getting out the plans; but yet it could not be said that for a great portion of the time there had been delay upon which he could give damages, for it should be remembered that the plaintiff had had two tribunals to pass—the Licensing Committee and the Building Committee. He did not see any ground whatever for sustaining the counterclaim, and therefore dismissed it, with costs. As to the claim, he was not satisfied that there was a special contract, and the defendant had failed to prove this. He allowed ten guineas for measuring the old building and attending before the committee, and £40 of the rest of the claim, £50 10s. altogether, with ordinary costs of counsel.

Dudley.—A new theatre, to be called the "Dudley" Opera House, is to be opened in about a week's time. The theatre has been built from the plans of Mr. A. Ramsell, architect, of Dudley. It is built in the Italian Renaissance style, with a frontage of 150ft., and a height, from the ground level to the symbolic figure on the apex of the façade, of 66ft. It is brick-built, with terra-cotta dressings, and will seat 2,000 persons. The stage is exceptionally large, its width being 72ft. 6in., its depth from the footlights to the back wall 36ft., and its height, from the floor-line to the "grid-iron," 50ft. The distance from the footlights to the last row of the gallery is 87ft., ~~whilst the height from the pit~~ floor to the dome in the ceiling is 41ft. The auditorium ceiling is designed in relief, with centre dome painted with sky effect, and the fronts of the dress circle and amphitheatre are in keeping, the prevailing colours being cream and gold. The whole of the building will be lighted by electricity.

Minehead.—A new infant school has just been completed according to plans prepared by Mr. W. J. Tamlyn, architect, of Minehead, which provides a large room, with a class-room and a cloakroom adjoining, to accommodate 160 infants. The building is constructed of local red brick, with patent self-lock roofing tiles on roof. The whole is well lighted and ventilated, and warmed by means of open fire grates on the Teale principle. All internal woodwork is stained and varnished. The total cost was about £560, including boundary walls.

Ystrad Meurig.—A new church, erected to the memory of Edward Richard, was consecrated by the Bishop of St. David's on Wednesday. The new building stands on the site of the old church, which had been in ruins for half-a-century. The old church had no architectural pretensions. The portion of the new church just completed consists of a nave, chancel and organ chamber. A western tower and vestry will be added as soon as the necessary funds have been raised. The chancel is raised two steps above the nave, and is entered under a bold and massive stone arch, being separated from the nave by a low stone dwarf screen. The sanctuary is raised two steps above the chancel, while the holy table is further elevated. In the south wall of the sanctuary are a credence niche and sedilia formed in the window recess. The pulpit forms a part of the structure, being entered under an arch formed in the north respond of the chancel arch. The wrought-iron grilled altar rail is placed at the entrance of the sanctuary. The architecture of the work is based upon fifteenth century style. The stone dressings are worked in red Hollington stone, the main part of the walls being built with good local stone. The massive timber roofs and all the internal woodwork are stained malachite green, of various shades. The passage, chancel and sanctuary floors are formed of red tiles. The font is placed near the western door. The roof is of red slates. The architect is Mr. Harold Hughes, A.R.I.B.A., and the contractors are Messrs. Charles Davies and Co.

Improvements at Stamford Park.—A Local Government Board inquiry was held on Wednesday at Ashton-under-Lyne Town Hall into the application of the Ashton-under-Lyne and Stalybridge Corporations to borrow jointly between £18,000 and £20,000 for improvements at Stamford Park. There was no opposition to the application.

Keystones.

The Loan Exhibition of Pictures at Deptford was opened by Mr. Justice Darling last Monday week.

A New School at Brecon for boys and girls is to be erected at a cost of £5,670 by Mr. T. E. Morgan, of that town.

A New School and Master's House at Ashwater, Devon, is to be built by Mr. W. Ball, of Okehampton, at a cost of £1,595.

Opening of the Atbara Bridge.—The ceremony of opening the Atbara Bridge for free passage was performed by Lord Kitchener on Saturday.

A New Workhouse Chapel at Upton-on-Severn is to be erected at a cost of about £450. The foundation stone was laid last Thursday by Lady Johnson.

Accident in Thackley Tunnel.—In the course of excavations to widen Thackley Tunnel, a large stone fell on a man named James Kelly, of Park Road, and fractured his left thigh.

The Latest London Hotel is the "Tudor," which stands at the corner of Oxford Street and Dean Street. It is a red brick building faced with terra cotta. The architects were Messrs. Pilditch, Chadwick and Co.

A Fatal Accident.—An ironworker named John Law was killed at Messrs. Johnson's works in Church Lane, West Bromwich, on Thursday morning. He was struck on the head by a beam which fell from the roof.

The Roumanian Exhibit at the Paris Exhibition of 1900 will be of considerable importance. The building in which it is to be housed will symbolise the national arts and industries of Roumania; the architect is M. Formigé.

A New Hall at Aberfoyle.—A new hall was opened recently, which has been erected at the expense of Mr. William Forrest, a local grocer. The new hall is 40ft. by 20ft., and provides dining accommodation for 250 persons.

A New School at Walsall was formally opened on Monday, last week. When completed it will accommodate 390 boys, 330 girls, and 350 infants, but at present only the mixed school, which provides for 765 scholars, has been erected. The style is a free Renaissance, and the designs were prepared by Messrs. Bailey and McConnal, the builder being Mr. W. Wistance. The cost is £8,666.

Fatal Scaffold Accident at Huddersfield.—Last Tuesday week Walter Schofield, foreman mason, of Rothwell Street, Moldgreen, who was in the employ of his brother, Alfred Schofield, contractor, of Dalton, fell from a chimney of a new building in Wheatstone Road. He sustained a fracture of the skull and of the shoulder, and died soon after his admittance to the infirmary.

The N.A.P. Window Co., Ltd.—At a meeting of the creditors of this company, held on Friday last, it was apparent that a scheme of reconstruction was likely to be carried through. A further adjournment of two months was therefore made to allow the scheme to mature. It was stated, however, that the receiver had made arrangements whereby all the orders were having prompt attention and would be executed as heretofore. We hope the proposed arrangements will be successfully carried out, as there can be no doubt that the company owns a number of really valuable patents.

A Statue of Burns in America.—The Burns Club of Barre, Vermont, U.S.A., has just erected a granite statue of Burns. The figure was modelled by Mr. J. Massey Rhind. On the pedestal are four panels representing, respectively, "The Cotter's Saturday Night," "Burns's Cottage," "Tam O'Shanter's Ride," and Burns at the plough, illustrating the poem "To a Mountain Daisy." On the top of the die are carved the rose, thistle, and blue bells. The total height of the monument is 22ft. 10in., and everything in connection with it is of Barre granite. The four panels were modelled by Mr. James B. King.

The Pavilion in Cathnays Park, Cardiff, erected for the purpose of the recent Eistedfodd, which was in process of demolition, suddenly collapsed on Wednesday morning. A man named Chappell was seriously injured, and another man was slightly hurt.

A New Infectious Diseases Hospital for Lincoln.—Mr. L. W. Darra Mair, one of the inspectors of the Local Government Board, held an inquiry last week into the application of the Urban Sanitary Authority for permission to borrow £1,167 for the purchase of land for a site for a hospital for infectious diseases.

Public Baths and Fire Brigade Station at Heckmondwike.—The Heckmondwike District Council have decided to apply to the Local Government Board for permission to borrow a further sum of £2,850 for the purpose of completing the public baths and fire brigade station, and £14,000 for the electric lighting scheme.

A New Infirmary and Nurses' Home at Tendring.—For the erection and completion of the new infirmary, nurses' home, &c., on the grounds adjoining the present Union Workhouse at Tendring, the tender of Mr. F. Thurman, Walton, near Ipswich, £10,799, has been accepted. The architect is Mr. Frank Whitmore, of Chelmsford.

The Gladstone Statue for Glasgow.—The Executive Committee of the Glasgow Gladstone Statue Fund met on Monday, last week, in the City Chambers, Glasgow. The sub-committee recommended that Mr. Thorneycroft, R.A., be entrusted with the work, and the Executive endorsed this decision. The total sum at the disposal of the committee is £3,500.

New Municipal Buildings at Clydebank.—At a meeting of the Clydebank Dean of Guild Court last Tuesday week, permission was asked by the Burgh Commissioners for the erection of municipal buildings on a site in Dumbarton Road. The plans were passed. The buildings will consist of public halls, municipal offices, police offices, public baths, and a fire brigade station. They are estimated to cost about £27,000.

Brickworks Accident at Howden.—An accident occurred recently at the Northumberland Brickworks, Howden, by which two men, named Joseph Wardle, of South Shields, a joiner, and Robert Hall, of North Shields, a labourer, received very severe injuries. It appears that these two men were working inside one of three kilns, which were just finished, and were removing the battens, when the whole of the kilns collapsed, and the men were buried underneath a large quantity of bricks and other debris. Several others received slight injuries.

New Primitive Methodist Church and Schools at Harrogate.—The trustees of the Primitive Methodist church and schools, Cheltenham Parade, Harrogate, have sold their present buildings and decided to erect a new set, the foundation stones of which will be laid on Tuesday, the 5th September. A plot of land has been secured on the Dragon Estate, opposite the new technical and art schools and fronting Bower Road. In addition to a handsome Gothic church, there will be commodious schools, lecture hall, and a complete suite of vestries. The total estimated cost is £8,000.

Accident at Windsor Castle.—While some men in the employment of Messrs. G. Cooper and Son, contractors to the Queen, were decorating a portion of the south corridor at Windsor Castle, last Tuesday week, a plank of the scaffold upon which they were standing suddenly snapped, and they fell a distance of about 12ft. to the floor Two of them escaped with a shaking, but Webb, the foreman, and Anscombe, a painter, were injured. Anscombe, whose left leg had been fractured below the knee, was promptly removed by the Lord Chamberlain's employés on a Castle ambulance stretcher to the Windsor Royal Infirmary, where he was attended to by Dr. Steele, the house-surgeon. Webb's injuries were of a less serious character, and after being seen by Dr. Casey he was conveyed to his home.

A New East Window has been placed in Greenhow Hill Church, Yorks., in memory of the late Vicar. The window was designed by Mr. C. E. Tute, and is of three lights.

Extensions to King Alfred's College, Taunton.—A new chapel and domitory at King Alfred's College, Taunton, is to be erected from designs by Mr. W. E. Tower, of 9, Queen Anne's Gate, Westminster, S.W.

A New Chapel at Loughborough was opened last Wednesday. The chapel is constructed principally of iron and wood, and has been erected at a cost of over £1,000. It will provide accommodation for 200 worshippers and 240 Sunday scholars.

A New Theatre at Camden Town.—A new theatre is to be erected in the High Street, Camden Town, N.W., by Mr. W. Wallis, at a cost of £25,000, from designs by Mr. W. G. Sprague, of Fitzalen House, Arundel Street, W.C.

Professor Hubert Herkomer has been made a Foreign Knight of the Prussian "Ordre pour le Merite" for Science and Art. There are not more than eight of these Orders given to foreigners, and the only other living English artist who has had the honour bestowed upon him is Sir Laurence Alma-Tadema.

Fatal Accident at a Quarry.—A man named Edward Hughes was killed by the fall of a piece of rock weighing about two tons, in Moelfferna Quarry, near Llangollen, on Wednesday morning. His head was completely crushed. Two other workmen were severely injured, but are favourably progressing.

A Dinner to Sir Laurence Alma-Tadema will be given in November next by his friends in celebration of the knighthood lately conferred upon him. Mr. Onslow Ford will be the chairman, and Messrs. Frank Dicksee, E. Waterlow, A. C. Gow, M. R. Corbet and others will form the dinner committee.

New Infectious Diseases Hospital for Linlithgow.—The competitive plans of Messrs. John Melvin and Son, architects, of Alloa, for a new infectious diseases hospital to be erected at Linlithgow have been accepted by the Joint Committee of the Burgh and District Committee of the County Council. Accommodation will be provided for twenty-four beds, and the estimated cost is between £6,000 and £7,000.

Troon Sea Wall.—The necessary permission having been obtained from the Court of Session for the Duke of Portland to convey to the Burgh Commissioners the ground required for the sea wall, which is to extend along the whole length of South Beach, the work will now be commenced. The contractor for the undertaking is Mr. Thomas Christie, of Stirling, and the contract price is £7,449 10s.

The Excavations at Tara have just been visited by a party of antiquaries, who found that a discovery of striking interest had been unwittingly made in the course of searching for the ark. Deep below the mound which marks the base of the former royal palace, and below the former level of the field, have been found remains of a structure cut in solid rock, and indicating the existence of a fortress dating from a period far earlier than the legendary history of Tara, as commonly known. As at Troy, there appear to have been successive layers of habitations on the same site.

Mr. George Wragge intimates that he has purchased the business recently carried on by Mr. John E. Carr under the name of "The Crafts" at Longsight, Manchester, and that, after having made special arrangements to retain Mr. Carr as manager and art director, he has now transferred the business to premises adjoining his metal works at Salford. Mr. Wragge has just been invited by the Commissioners to supply the stained glass and casements to one of the important rooms in the Royal Pavilion at the Paris Exhibition. He has taken the work in hand. Mr. Wragge has also opened offices in the Bigg Market, Newcastle-on-Tyne.

New Patents.

The following abridged description is specially drawn up for the Builders' Journal and Architectural Record *by Messrs. Hughes and Young, Patent Agents, 55 and 56, Chancery Lane, London, W.C., from whom all information relating to Patents, Designs, and Trade Marks, may be obtained free of charge.*

9450. Drains.—Patentee: J. Morgan, of Sunnybank, Pontardawe, Swansea. Ventilating manholes. A small chamber is built in the manhole and fitted with an air-inlet grating. The air passes to the drains by a pipe, the flow being regulated by a valve.

23,767. Roofing-tiles.—Patentee: G. E. Evans, of Church Street, Bridgetown, Cannock, Staffordshire. Longitudinally-curved tiles, with hanging nibs or projections, are moulded between curved dies. Recesses are made in the end of the convex die to receive the plastic material forming the ribs.

9335. Tiling ceilings, walls, &c.—Patentee: W. Hewitt, of Victoria Tile Works, Hereford. Semi-circular recesses in the edges of the tiles engage with flanged studs projecting from strips supported by rabbeted slats fixed to the ceiling or other surface. The joints between the edges of the tiles may be made straight or of other suitable shape, and the slats may be rectangular in cross-section. In some cases headed studs are screwed into the slats, joists, or woodwork, and slotted washers are slipped on the studs, and can be turned in the grooves in the tiles.

9433 Windows; window holders.—Patentee: H. G. Stratford, of Fanshaw Street, Newtown, Southampton. At each side of the frame two toothed wheels are mounted on pivots, and are provided with barrels on which is wound a chain passing round a sheave of a balance-weight. The toothed wheels gear with racks fixed to the sashes, and are locked by pins which pass through holes in the frame and between the teeth of the wheels. When either sash is lowered the chains are wound up, and the balance-weights are raised. The pins lock the sashes in any required position. A removable panel or pocket-piece is fitted in the frame at each side.

New Companies.

Glenyards Fire-clay Company Limited.

This company was registered with a capital of £4,000 in £1 shares (500 five per cent. preference) to adopt an agreement with Mr. David Graham, brick manufacturer, Falkirk, and to carry on the business of brickmakers, quarrymasters, &c. Registered office: Glenyards, Bonnybridge, Stirlingshire.

Southall Development Syndicate, Limited.

This company was registered on August 17th, by Mr. C. F. Twist, of 5, Bedford Row, W.C., with a capital of £15,000, in £1 shares, to acquire the Hambrough Estates, at Southall, Middlesex, and to carry on the business of landowners, builders, &c. The first directors (to number not less than three nor more than five), are to be appointed by the subscribers. Qualification, £500. Remuneration as fixed by the company.

Shawford South Down Estate Limited.

This Company was registered on August 15th, by Messrs. Morgan and Co., of 33, Old Broad-street, E.C., with a capital of £20,000 in £1 shares, to acquire and deal with any land, house, and other property, and to carry on the business of builders, financiers, &c. The first directors (to number not less than three nor more than six) are to be appointed by the subscribers. Qualification, £100. Remuneration as fixed by the company.

Blænycwm Slate Quarry Company, Limited.

This company was registered on August 16th, by Messrs. Waterlow Brothers and Layton, Limited, of Birchin's Lane, E.C., with a capital of £6,000, in £5 shares, to adopt an agreement with Mr. George Watson for the acquisition of the business carried on by him at Blænycwm, Carnarvon, and to carry on the business of quarrymen, &c. The first directors (to number not less than two nor more than five), are Messrs. George Watson, David Watson and James Morgan. Qualification, 10 shares. Remuneration as fixed by the company.

Nesbitt Brothers.

This company was registered on August 23rd, by Mr. T. C. Houston, 43, Lower Sackville Street, Dublin, with a capital of £2,000 in 400 £5 shares, to acquire and take over as a going concern the business of Messrs. Nesbitt Brothers, engineers, of Belfast, and to carry on the same. Directors are to number not less than three nor more than five, the first being Messrs. Thomas Hunter Nesbitt, James Hope Nesbitt, sen., William Courtney Nesbitt and James Hope Nesbitt, jun. Registered office: 24 and 26, Townsend Street, Belfast.

Julius Sax and Co., Limited.

This company was registered on August 21st, by Messrs. Francis and Johnson, of 19, Great Winchester Street, E.C., with a capital of £18,000 in £1 shares, to acquire the electrical undertakings of Messrs. Julius Sax and Co., Limited (incorporated in 1892), to adopt an agreement with Mr. H. M. Salmony, and to carry on the business of electricians, electrical engineers, electric light contractors, &c. The first directors (to number not less than three nor more than five) are Messrs. G. Arbuthnot, L. C. F. Oppenheim and H. M. Salmony. Qualification, £1,000.

Caledonian Copper Company, Limited.

This company was registered Aug. 1st, by Messrs. William and Co., of Winchester House, E.C., with a capital of £750,000 in £5 shares, to acquire, upon the terms of a certain agreement, the copper mines known as the Pilou and Ao Mines, situate in the Diahot district of New Caledonia, and to develop and work the same; and, further, to carry on in all or any of their respective branches the business of builders and contractors, quarry owners, brick and tile makers, engineers and iron founders, colliery owners, and coal merchants; to acquire any other mines, mining, water, and other rights, grants, leases, claims, concessions, options of purchase, alluvial ground, &c., in any part of the world, and to develop, deal with, work and turn to account the same in such manner as the company shall see fit; to develop the resources of lands acquired by the company by clearing, draining, planting, farming, and building thereon; to lay out towns and villages; to acquire and turn to account any patents, patent rights, and inventions, &c. The signatories (each one share) are Messrs. P. S. Bruff, A. J. Romeril, W. R. Rolfe, A. W. Phillips, R. S. Lowe, J. J. Taylor and E. M. Cope. The first directors (of whom there shall not be less than three nor more than seven) are to be elected by the signatories. Qualification, £200. Remuneration: Chairman, £500; ordinary directors, £250 each.

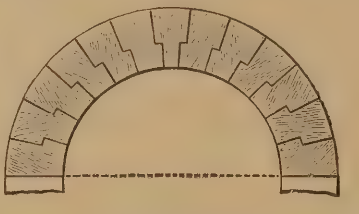
FIRE-PROOF CONSTRUCTION.

There are a good many excellent fire-proof partitions on the market that admirably serve the purposes for which they are intended, but nothing, perhaps, is better adapted for the construction of partitions and ceilings in all classes of buildings when fire-proof qualities and rapid and economical construction are desired than the material known as "Scagliol." Experiments have been made which proved to the most sceptical witnessess of them that Scagliol possesses these advantages. It is claimed that while a Scagliol partition only 3in. thick is much lighter, and there is besides a great saving of space and time in its erection, it is quite as fire-proof as a brick wall 6in. thick, when plastered on both sides. A Scagliol partition, 3in. thick, is also stronger, more sanitary, fire-proof, and vermin-proof than a lath and plaster partition of even greater thickness. At a recent test a piece of wood skirting and a wood shelf loaded with a quantity of iron, were fixed on the Scagliol walls to show that it will effectively retain nails or screws for wood-fixing purposes. This durable and economical fireproof construction is manufactured by the London Portland Cement Co., Limited, of 123, Bishopsgate Street, Within, E.C., who, it will be remembered, are the manufacturers of the patent Petrura plastic slabs and the A.Z. fireproof floors, which we noticed a few weeks ago.

AN IMPROVEMENT IN ROMAN ARCHES.

The heading of these remarks is in a sense quite an anomaly. It is true that the Romans have been credited with inventing that very useful part of architectural construction, without the utilisation of which a tunnel would be practically impossible. But the Romans were always plunderers, so it is not remarkable that they acquired the idea of arch construction from Egypt, where the modern method of arching roofs was in active working at least four thousand years ago. After such a lapse of time it appears almost ridiculous for an individual to come forward and suggest that the true method of arch construction is not yet known. Nevertheless, we have recently had submitted to us an idea which may possibly be of great importance to the building community. Our illustration shows a section of an arch composed of a kind of dovetailed brick, which can be made of clay, terra-cotta, or other material. The interlocking is so contrived that every brick becomes a keystone. Should it turn out that this new form of brick only partly carries out the claims of the two collaborating inventors, their efforts may result in such a development of engineering stability, as regards the construction of bridges, culverts, &c., as is hardly thought of at the present time. In the case of a badly made arch, when one brick falls the whole erection is at once liable to collapse, but according to the claim of Messrs. Grayson and Spratly, the patentees of this design, their bricks can be so interlocked, in a variety of ways, that whether used for ornamental arches, or colossal viaducts and tunnels, the result must be such a welding of the material into a solid mass that the structures should be as enduring as those of the ancients. This ingenious contrivance was introduced to us by one of the patentees, Mr. Spratly, of 32, Bridge Road, Hammersmith, W.



COMING EVENTS.

Wednesday, Aug. 30, to Saturday, Sept. 23.

Sanitary Institute.—Eighteenth Congress and Health Exhibition at Southampton.

Monday, October 2.

Worshipful Company of Carpenters.—At the Carpenters' Hall, London Wall, E.C. Commencement of evening classes in building construction, drawing, and quantities. Architectural lectures at the King's College, London. Particulars can be obtained from the Secretary at the College, or from Mr. S. W. Preston at Carpenters' Hall.

Monday, October 9.

Worshipful Company of Carpenters.—At the Carpenters' Hall, London Wall, E.C. Commencement of evening classes in architectural and constructional drawing, quantities, surveying, &c., and lectures on architectural construction at the University College. Particulars can be obtained from the Secretary at the College, or from Mr. S. W. Preston at Carpenters' Hall.

CONTRACTS OPEN.

LEYTON URBAN DISTRICT COUNCIL

TO CONTRACTORS AND OTHERS.

PUBLIC STREET IMPROVEMENTS.

The Leyton Urban District Council invite Tenders for PAVING, CURBING, and CHANNELLING over the Great Eastern Railway Bridge, Leyton Station.

Specifications, quantities, and forms of Tender may be obtained on and after Monday, the 28th inst., on application to Mr. WILLIAM DAWSON, M.Inst.C.E., the Council's Surveyor, at his Offices, Town Hall, Leyton, between the hours of TEN and FOUR (Saturdays, TEN and TWELVE).

Sealed Tenders, in specially endorsed envelopes supplied with the forms, accompanied with a £10 Bank of England Note enclosed with the Tender, to be forfeited if the Tender is withdrawn before the contract is signed, must be delivered at the Town Hall, Leyton, on or before TUESDAY, SEPT. 5th next, at FOUR p.m.

The Council does not bind itself to accept the lowest or any Tender.

Sureties will be required for the due performance of the contract.

R. VINCENT.
Town Hall, Leyton. Clerk to the Council.
August 26th, 1899.

PARISH of FULHAM.

INFIRMARY PAINTING AND CLEANING CONTRACT.

Notice is hereby given that the Board of Guardians of the Parish of Fulham, are prepared to receive TENDERS for INTERNAL PAINTING, DISTEMPERING, and other WORKS, at their Infirmary, St. Dunstan's-road, Hammersmith, W.

The specification and conditions may be perused, and forms of Tender obtained, at my Offices, any day between the hours of TEN a.m. and FIVE p.m., upon the deposit of £1 1s. sterling, which will be returned to persons sending in bonâ-fide Tenders.

Tenders made out on the prescribed form and properly sealed, and marked on the outside "Tender for Painting, &c.," are to be delivered at my office, not later than ELEVEN o'clock in the forenoon on THURSDAY, SEPTEMBER 14th next, at which time the Guardians will proceed to open and consider the same.

Persons tendering, or their duly authorised agents, must be then in attendance.

The Guardians do not bind themselves to accept the lowest or any Tender.

By order,
T. APLIN MARSH.
Guardians' Offices, Clerk to the Guardians.

THE PROBLEM SOLVED!

ORDINARY WOOD RENDERED FIRE-RESISTING THROUGHOUT WITHOUT AFFECTING ITS UTILITY AS A BUILDING MATERIAL.

The London Non-Flammable Wood Co. Ltd.

who have recently introduced into Europe the process now being so largely used in America, have erected large works in this country, and are now taking Orders for the supply of their

NON-FLAMMABLE WOOD.

The whole of the Carpentry and Joinery in the following notable buildings in New York, amongst others, consists of NON-FLAMMABLE WOOD:—

THE COMMERCIAL CABLE BUILDING,
THE QUEEN'S INSURANCE BUILDING,
. . and . .
THE R. G. DUNN BUILDING.

NON-FLAMMABLE WOOD has been tested by H.M. Admiralty, and large Orders have been given by H.M. Government.

Quotations on receipt of Requirements, Address, &c.

2, Army and Navy Mansions, Victoria Street, London, S.W.

METHODS OF PILING FOUNDATIONS.

By G. Ellis.

TIMBER piles are used as the foundations of buildings where the site to be covered is either waterlogged or has a soft silty surface strata, covering firm ground some distance below. In the first instance, sheet piling is employed. This consists in surrounding the site with a wall of comparatively thin timbers to a depth dependent upon the amount of water in the soil, and the weight of the building to be erected. The object is to prevent the soil running out under the load, which it would otherwise do, and very unequally, according to the different load on different parts of the building. If possible, the site is drained before the building is commenced.

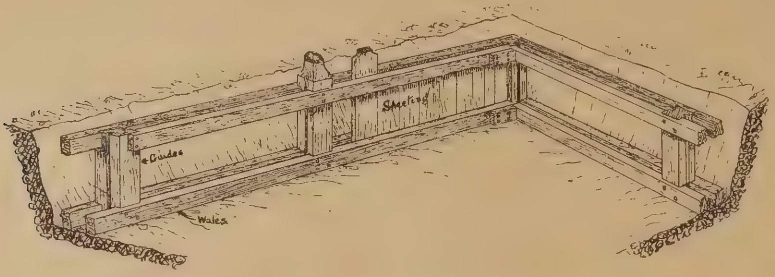

Fig. 1.—A sheet-piled site.

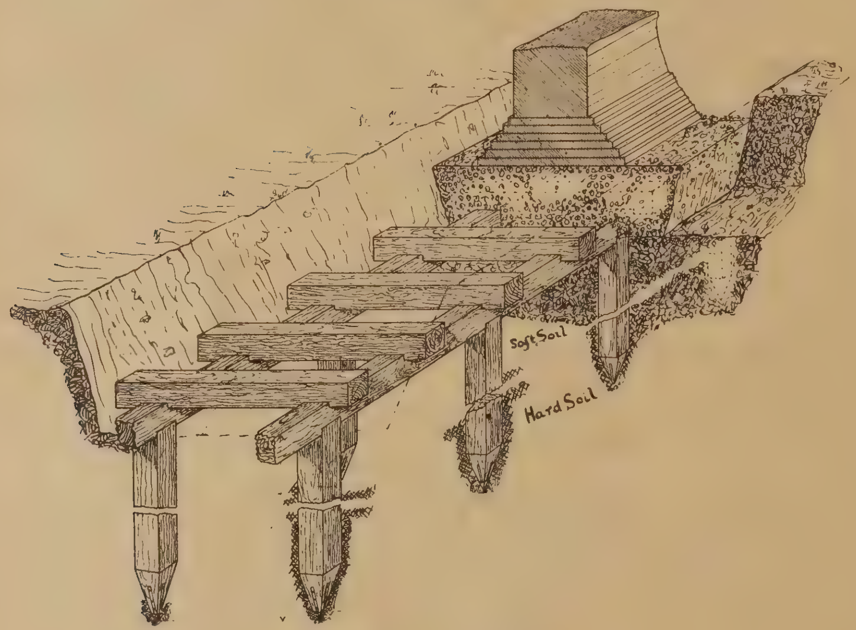

Fig. 2.—Bearing piles.

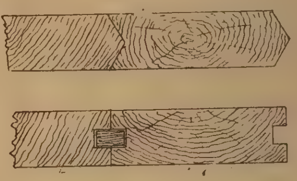
Fig. 1 is a sketch of one corner of a sheet-piled site in course of preparation. The work is generally carried out in the following manner: The position of the walls is set out on the ground, and trenches are made some 3ft deep; guide piles, about 10in. square, are then driven at the four corners, about 18in. outside the base line of walls; intermediate ones, about 18ft. apart, are then driven in line with the former; the heads of these guides are left level with the ground line, and connected by horizontal rows of timbers termed "wales," bolted in pairs on each side of the piles, one row at the heads and another at the bottom of the trench. These wales are notched out until the space between them nearly equals the thickness of the sheeting. Sheeting is composed of 9in. by 2in. or 11in. by 3in. planks, either square-jointed, or grooved and tongued, or bird's-mouthed, as shown in Figs. 3 and 4. The bottom ends of these sheet piles are cut to a sharp edge of V section, and with the edge inclined from 30deg. to 45deg., as shown in Figs. 5 and 6. This inclination is given to them so that they may drift together in driving and so tighten up the joints.

If the soil is gravelly, pieces of thin sheet iron should be bent round the foot and fixed with clout nails to protect the edge. The guide piles are trimmed to a pointed shape, and, when necessary, a cast-iron shoe is fixed to the point, as shown in Fig. 7. There are several patented shoes on the market, designed to prevent the shoe being knocked aside or disconnected in driving, but these are mostly used in harder soils than we are dealing with at the moment. The sheet piles are entered between the wales, the first one, of course, against a guide post, which is either grooved to receive the whole thickness of the sheet pile or with an inch groove to receive a tongue, as shown in Fig. 8, and they are driven down usually with a wooden maul, termed a "beetle," until they are level with the upper wales. These are then removed, and the driving is continued until the lower row is reached; then the guides are cut off level with the rest, and either the trench (or the whole site excavated to the same depth) is covered with a layer of concrete, up to the heads of the piles, and the superstructure is commenced therefrom.

In the second case mentioned (a soft, silty surface covering firm ground below) two alternative methods are employed, according to circumstances. In the one, piles of considerable length are driven through the soft strata until they enter the solid ground beneath, or if this distance should be too great for piles of the requisite length to be readily obtained—and the limit may be taken as 36ft.—short, stout piles are used, driven at close centres, and depending for their effect upon the friction of the soil upon their sides. The former are termed bearing piles, the latter friction piles, and the safe load is calculated on the former to be equal to 2½ cwt. per square inch of section, and on the latter to 1½ cwt. per square inch of section, which is equivalent to 12½ tons on a pile 10in. square in the first case, and to 16¾ tons on a pile of 15in. side in the second case.



Figs. 3 and 4.—Details of sheeting joints.

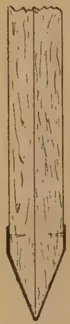


Fig. 5.—Shoes for sheeting piles.

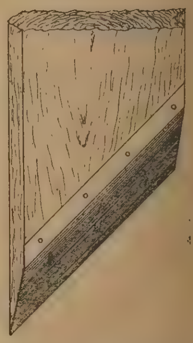

Fig. 6.—Side view of foot of Fig. 5.

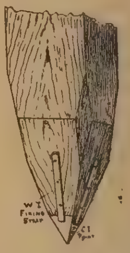

Fig. 7.—Shoe for guide pile.

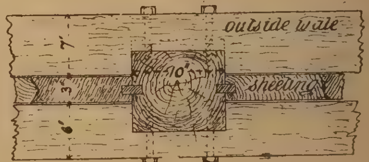

Fig. 8.—Method of fixing wales.

Fig. 2 illustrates the method of preparing the foundations in a soft top soil with firm soil beneath. Two rows of 12in. piles, 8ft. apart, are driven about 3ft. into the solid bottom, with 9in. by 9in. sleepers, notched and spiked to their heads; across these at right angles are notched balks of similar scantlings, about 2ft. 6in. apart, and the timbering is continued through the wall trenches. The ground is filled in to the underside of the sleepers, well rammed, and the entire trench filled in with concrete to a depth of 12in. above the timbers, and from this the footings commence. All the timbers should be creosoted before use to prevent decay.

(To be concluded.)

Electric Lighting at Heckmondwike.—The District Council has agreed to apply for sanction to borrow £14,000 for electric lighting purposes.

PREVENTION OF SMOKE.*

By THOS. G. DEE, A.S.I.

DRASTIC, indeed, were the measures taken to ensure the prevention of black smoke, caused by the combustion of coal in these realms, in the year of Our Lord 1306, when, by virtue of an enactment promulgated by His Most Gracious Majesty King Edward I., one John —— was tried, condemned, and executed for burning coal in the City of London.

With all the accumulated knowledge of to-day, with the elaborate methods for the analysis of combustibles, the learned theories of chemical combination of gases, evolved at, and maintaining high temperatures, we are possessed of no more certain method for preventing black smoke than that enforced 600 years ago.

The times, however, are "out of joint" with such a method of solving the problem we are considering to-day. In our examination of the effects of the legislation of the present day, and its enforcement upon the nation generally, with respect to black smoke, we shall, therefore, doubtless do well to give due prominence to all sides of the question, so that we may attain, as far as possible, the aim of all good politicians—*i.e.*, the greatest good for the greatest number.

Our consideration of this question cannot, therefore, be confined to the law and its literal enforcement, for, like so many of the other subjects we Sanitary Inspectors have to deal with, this likewise has an educational side. Therefore, unless we are acquainted with at least the rudiments of the science of combustion, how dare we claim to be fully equipped to carry out this branch of our crusade for the advancement of the public health?

I purpose, therefore, to very briefly discuss our subject under four heads:—

(*a*) The theory of combustion.
(*b*) The development and the decomposition of coal.
(*c*) The history of the special application of (*a*) and (*b*) to the modern furnace.
(*d*) The law thereon.

The true theory of combustion was first enunciated by a French chemist, named Lavoisier, in the eighteenth century. Working on matter gathered by himself and others, he demonstrated three principal facts:—(1) That whenever a substance burnt, if the whole of the products of that combustion were collected, those products were greater in weight than the material consumed. (2) That the amount of heat obtained by the combustion of a given weight of the combustible was always the same. (3) That the substance which had been added to the combustible was always oxygen, and that the atmosphere had lost oxygen.

As magnesium oxide is a non-volatile substance, I will now try to show you that by burning a piece of magnesium wire in the air of this room, the resultant substance or ash is of greater weight than the magnesium burnt, and further, that the physical properties of magnesium oxide are very different from those possessed by either the magnesium burnt or the atmosphere absorbed.

[*Experiment.*—Equal weights of magnesium wire were placed in each of the scale pans of a balance, one portion was burnt, becoming thereby much heavier, and the difference of the physical properties of colour, &c., were observed.]

Proofs of the other facts Lavoisier demonstrated are too elaborate for the short time at our disposal to-day. They are, however, as incontrovertible as the one I have demonstrated, and we know therefrom that oxygen, which as a colourless, odourless gas forms one-fifth by volume of our atmosphere, must have been absorbed therefrom, and be present in another form in all products of perfect combustion.

The substances most readily burnt are those containing both hydrogen and carbon. The first is a colourless, tasteless, odourless, very light gas; the other a solid, one form of which is known as charcoal. Either of these substances, separate or chemically combined, when brought into contact with free oxygen under suitable conditions and at definitely high temperatures, combine with that gas to form fully oxidised and well-known compounds. The combination with hydrogen, on cooling, is a liquid (water); the combination with carbon is carbon dioxide, a heavy but colourless gas. An intermediate compound of carbon and oxygen is a gas known as carbon monoxide. This gas will burn readily (*i.e.*, oxidise) into the previously mentioned carbon dioxide.

As typical of compounds of hydrogen and carbon (hydro-carbons) we will consider ordinary coal gas, and I will now try to show you that, for oxidation to take place, it is immaterial whether we burn coal gas in atmospheric air or atmospheric air in coal gas.

[In the experiment which followed, a jet of atmospheric air was burnt in a glass chamber full of coal gas.]

As typical of the change of state which takes place during the combustion of the solid compounds of hydrogen and carbon, we will now examine the combustion of a candle. Here the flame is hollow, and the solid hydrocarbon of which our candle is composed has been formed into a gas by the temperature of the burning wick, and of this gas that portion which is on the outer side is in immediate contact with the oxygen of the room and therefore burns, whilst the combustible gas is continually distilled into the hollow centre.

[In the experiment illustrating this the gas produced by the burning candle was drawn off from the centre of the hollow space within the flame through a tube, and burnt at a distance of several inches from the point of its production.]

No black smoke has been produced during the combustion of the gases we have used, but by interfering with the conditions of the oxygen supply we can obtain an imperfect combination. The most simple illustration of this is shown in the burning of an oil lamp, when, if the rate of production of the gas from the oil is in excess of the air supply, we say the lamp smokes, and turn down the wick to limit the amount of the gas generated, to the capacity of the air supply in the consuming chamber (*i.e.*, the chimney).

Again, the air supply for the oxidation of coal gas is different in an illuminating and in a Bunsen burner, and whilst we can interfere with the diffusion of the oxygen into the gas in the illuminating burner by placing a cold plate on it, and thereby get free carbon as a product of the imperfect combustion we have set up, we cannot thus interfere in the case of a Bunsen burner because of the perfect admixture of gas and air which exists in this latter case. [These results were proved by experiment.]

The following is a table which shows the relative weights of the substances usually produced by the combustion of the elements present in coal:—

12lb. of carbon unites with 16lb. of oxygen and forms 23lb. of carbon monoxide.
12lb. of carbon unites with 32lb. of oxygen and forms 44lb. of carbon dioxide.
1lb. of hydrogen unites with 8lb. of oxygen and forms 9lb. of water.
32lb. of sulphur unites with 32lb. of oxygen and forms 64lb. of sulphur dioxide.
1lb. of hydrogen unites with 16lb. of sulphur and forms 17lb. of sulphuretted hydrogen.

The only *black* substance (if any) set free during the combustion of the substances enumerated in the foregoing list is carbon, and that in a state of very fine division.

From the brief epitome of the theory of combustion which I have laid before you I trust you will permit me to assert that for perfect rapid combustion of hydrocarbons it is essential that they should be brought into intimate contact with free oxygen at a high temperature, and that the perfect oxidation of all the carbon present in the combustible prevents the possibility of the emission of *any* black smoke.

The next subject for a brief comment is coal. This, for the purposes of a readily combustible material, may be considered as, essentially, a compound of hydrogen and carbon. The source from whence the carbon present was obtained was that heavy colourless gas, carbon dioxide, to which I have previously referred. This gas, which is present in a very small proportion in normal air, is absorbed by living green vegetation in sunlight, oxygen is set free, whilst the carbon and the heat derived from the sun are built up into the growing plant together with water to form wood, or more correctly to form a carbohydrate called cellulose, a substance in which 72lb. of carbon, 10lb. of hydrogen and 80lb. of oxygen are the proportions in which those three substances are found.

This cellulose, which is 44 per cent. of carbon and 6 per cent. of hydrogen, having undergone chemical change in the coal measures, has been converted into various kinds of coal according to the variation in the elimination of its components (hydrogen, oxygen, and carbon) until in round numbers there is found:—

In such a new coal as Lignite, 75 per cent. of carbon to 5 per cent. of hydrogen.
In Bituminous coal, 85 per cent. of carbon to 5 per cent. of hydrogen.
In Steam coal, 88 per cent. of carbon to 5 per cent. of hydrogen.
In Anthracite coal, 92 per cent. of carbon to 4 per cent. of hydrogen.

That is to say that by the physical action of pressure and temperature chemical changes are set up resulting (often in a ratio to the time occupied) in larger percentages of carbon being left in the coal.

Experiment.—I will now attempt to show you that from the *colourless* solution present in this beaker, which is a carbohydrate as truly as cellulose is, it is possible to so alter its chemical nature that black carbon shall be set free, and this you see is done by the addition of another colourless liquid.

Please note that carbon dioxide, water vapour, and heat are given off to the atmosphere when coal burns, providing that atmosphere with substances which living green vegetation requires for its support and growth and to enable it to retain for future use the heat of the sun.

Necessarily, therefore, from some source this product of the oxidation of carbon is an essential part of the atmosphere if the cycle of life on the earth's surface is to be maintained.

It must, however, be remembered that this change from growing vegetation to coal took place under conditions in which other substances became incorporated with the coal, and for our purpose the most important admixture is that of sulphur, which in varying though small proportions is always present in coal. This sulphur may become oxidised and passed into the atmosphere as sulphur dioxide, a deleterious gas, or it may combine with hydrogen to form that very disagreeable, odorous and dangerous gas, sulphuretted hydrogen.

We now know that the object of furnace construction, as far as the prevention of black smoke is concerned, is to bring about such conditions therein as shall cause the conversion of the whole of the carbon present in the coal into carbon dioxide, and that has to be done by bringing oxygen into close contact with the coal at high temperatures.

The requisite conditions are, therefore: means of control of the rate of the flow of air through the furnace, *i.e.*, air inlets and air outlets, with means of shutting off both partially or entirely; a chamber sufficiently large, both superficially and cubically, to allow coal and air to diffuse into each other, *i.e.*, a fairly large firebox with a sufficient grate area. Given these, and a suitable coal, by properly using his damper, his furnace door, maintaining a uniform temperature in the furnace, even stoking from front or sides and good clinkering, an able stoker can obtain a proper result in water evaporation without the formation of black smoke.

Unfortunately, however, it is very usual to require a boiler to produce more steam than it does readily, *i.e.*, to obtain a larger result from

---

[*] A paper read before the Annual Provincial Conference of the Sanitary Inspectors Association at Lincoln on August 4th.

the capital value of the plant laid down than should be expected. Also, it is often attempted to decrease the daily coal bill by using a cheap kind of coal, and such improper attempts are often the cause of the emission of black smoke, which fortunately a due enforcement of the law will soon make very costly methods of economising.

(To be concluded.)

Builders' Notes.

A Slater's Affairs.—Last Wednesday, in Ayr Sheriff Court, before Sheriff Orr Paterson, John Sime, slater and plumber, of York Street Lane, Ayr, appeared in a petition for cessio. In examination he stated that he had been twenty-eight years in business altogether, the last four years being in Ayr. He attributed his present deficiencies to the rise in the price of materials after he had undertaken different jobs. The value of his stock he estimated at £50. He had been forced to take out cessio owing to being pressed by his creditors. Mr. David Crawford, accountant, of Ayr, was appointed trustee on the estate.

Leeds Building Employers' Picnic.—The annual picnic of the Leeds Master Builders' Association on Wednesday was a very enjoyable function for those concerned. After lunching at the Builders' Exchange Club, the members drove to Harewood *viâ* Collingham and the Avenue. As usual, the annual meeting of the Association was incorporated with the outing. A visit was paid to Harewood Park. After rambling about the park for a few hours the party returned to Leeds, and in the evening the annual dinner was held at the Queen's Hotel, with Mr. Dews, the president-elect, in the chair.

Case Under the Employers' Liability Act.—At Chelmsford County Court, on Monday last week, an action under the Employers' Liability Act was brought by Mrs. Susannah Little, widow of Charles Little, against Messrs. Brown and Son, Limited, timber merchants, of Springfield, to recover £300 as compensation for the death of her husband. The deceased, who was a carman, was engaged with other men in moving a large piece of timber when the timber slipped, and scraped the flesh off the back of his hand. He was removed to a hospital in London, where he died from lockjaw. The facts were not disputed, and the only point raised was whether the yard in which the accident occurred was "about a factory."—His Honour held that it was, and it was thereupon agreed that the plaintiff should be awarded £100 and costs.

The Hull Building Dispute.—Alleged Contempt of Court.—On Wednesday, Mr. Justice Cozens-Hardy, sitting as Vacation Judge in the Chancery Division of the High Court, had before him a motion for attachment in the case of Walters *v.* Green for contempt of court on the part of the defendants in disobeying an injunction granted by Mr. Justice Stirling just before the close of the Trinity sittings. Counsel for the defendants asked that the motion might stand over for a week in order to afford an opportunity for answering the affidavits, copies of which had only been delivered on the previous Monday. The motion was to commit the defendants for a breach of an injunction restraining them from watching and besetting certain workmen at Hull. Mr. Mulligan, Q.C., who appeared to support the motion, admitted that the request was reasonable, but suggested that some limit should be fixed for putting in the defendants' answers to the affidavits. Defendants' counsel undertook that copies of the affidavits should be delivered not later than Friday, and upon that undertaking the motion was ordered to stand over till to-day.

Masters and Men.

Kilmarnock Joiners' Strike.—At a meeting of the master joiners last Wednesday night it was decided to grant an advance of ½d. per hour which has been demanded by the men. The wages are now 9d. per hour.

The Amalgamated Operative Slaters' Society of Scotland opened a new branch at Alexandria on Saturday week, when a large number of the slaters employed in the Vale of Leven became members. A deputation from the central board at Glasgow was present, and explained the objects and benefits of the association.

Engineers' Wages in Mid-Lancashire.—Lord James of Hereford has consented, on the invitation of Mr. T. Biggart and Mr. G. N. Barnes, to act as umpire and to decide the question as to the state of trade in mid-Lancashire between April 1st and the end of June last. The inquiry will be entered upon as early as possible next month, but whether in London or Manchester is left to the option of Lord James.

Dundee Master Plasterers have withdrawn the advance of ¼d. per hour which they offered on 20th July last to the labourers now on strike, and which the latter refused to accept, persisting in their demand for an advance from 5½d. to 6d. per hour. The masters declare that they will pay the standard rate of wages for the district—viz, 5½d. per hour, and that all their shops are open to employ free labour.

Compensation Case Settled at Stourbridge.—At the Stourbridge County Court on Wednesday, before Sir R. Harrington, Bart., a case was entered under the Workmen's Compensation Act, in which Thomas Mills, clay miner, was the plaintiff, and Messrs. Mobberley and Perry, fire-clay manufacturers, were the defendants. It was a claim for injuries to Mills' spine. Mr. Hinds said he represented the applicant, and the respondents had sent him an agreement to an award upon the basis of a weekly wage of 21s. 6d., and he asked for an award of 10s. 9d. per week. There was no period mentioned, and his Honour asked whether the award would be for life, to which question Mr. Hinds answered in the affirmative. Costs were granted on the £50 scale up to the date of the defendants' letter agreeing to an award.

The Danish Labour War.—It is reported that the threat of the Employers' Federation to extend the lock-out to trades hitherto unaffected has been carried out. All the tailors, blacksmiths, locksmiths, wainwrights, cement workers and stonemasons in Denmark are thus put out of work. The lock-out of the tailors also includes the women engaged in the making of mens' clothes, some 2,000 in number. Altogether some 12,000 more workers have been turned on to the streets, making a total of 52,000 in all. The exclusion of the women, many of whom have hitherto supported husbands who were already locked out, has created much adverse comment. The strike, which now embraces nearly two-thirds of the whole industrial population of the country, has lasted ever since May. The employers seem determined to starve out the whole body of Danish workers rather than declare themselves beaten. The finances of the Trade Union Federation are getting low, and only help from outside can enable them to hold out successfully. The employers declare that the following points must be agreed to by the men before the lock-out is withdrawn: (1) There must be national agreements in future, and not local. (2) The employers are to reserve to themselves the absolute right as to deciding the method and division of work in the factories and workshops without interference from the unions. (3) The foremen must not be members of the unions. (4) All agreements as to terms to terminate on January 1st of each year.

Leeds Bricklayers' Dispute.—A meeting of the Leeds Master Builders' Association was held on Tuesday, last week, at the Exchange Club, to consider the ballot that had been taken on the proposed settlement with the London Order of Bricklayers, which includes an advance of ½d. per hour. In the absence of Mr. W. Nicholson, the president, the chair was taken by Mr. W. H. Dews, the vice-president. It was reported that ninety-two papers had been sent out, and that fifty-one had been returned. Of these, forty-eight were opposed to the advance, and the remaining three were in favour of it. Two of the three, however, were signed by members who do not employ bricklayers. After some discussion it was decided to adjourn the meeting for a week with a view to seeing whether any further replies would be sent in.

Contractor Sued for Compensation.—In Edinburgh Sheriff Court recently, before Acting Sheriff-Substitute Sym, parties appeared in an action under the Workmen's Compensation Act at the instance of Donald M'Kinnon, labourer, of 16, Murdoch Terrace, Edinburgh, against John Best, contractor and quarrymaster, residing at Warriston House, Inverleith Row, for 11s. 8d. weekly as long as the plaintiff is unfit to follow his usual employment.—Mr. William Spink, for the plaintiff, explained that his client was engaged at Craigleith Quarry, of which the defendant was lessee. On the morning of May 6th last the plaintiff was walking down a road inside the quarry when the ground gave way under his feet and he was precipitated a distance of about 14ft. His left arm was fractured, and he received such other injuries that he had not been and would not be able to work for some time.—For the defendant, who was represented by Messrs. Macpherson and Mackay, it was pointed out that the man's wages had been at the rate of 18s. 7d. per week, so that he was only entitled to sue for 9s. 3½d. under the Act. An offer to pay the smaller sum was accepted by the plaintiff.

Engineering Notes.

The Police Station, Egremont, is being fitted by John King, Limited, engineers, Liverpool, with their latest improved economical hot water heating apparatus.

Electric Lighting at Brighton.—The Local Government Board has given its sanction to the loan of £64,000, for twenty-four years, for purposes of electric lighting.

The Small Pox Hospital, Whitmore Common, Worplesdon, is being warmed and ventilated by means of Shorland's patent Manchester stoves, with descending smoke flues and patent exhaust roof ventilators.

Eastbourne Electric Lighting Works are to be taken over by the Corporation at the beginning of next year, and a resident engineer is to be appointed at a salary of £300 a year. He will be required to devote the whole of his time to the duties of his office. Applications are to be sent in by September 1st.

Electrical Engineering in Sweden.—The Swedish State railway authorities have placed a contract with Messrs. Siemens and Halske for the establishment and equipment of electrical power stations at Abiskojokk and Kadeyokk, near the new railway between Gellivaia and the Norwegian frontier.

New Electric Lighting Works at Poplar.—The foundation stone of new electric lighting works, which are estimated to cost £10,000, was laid at Poplar recently. A scheme has been prepared by which over twenty miles of streets will be lighted by electricity, and the works are to be built by direct labour from the plans prepared by the surveyor to the board.

Surveying and Sanitary Notes.

Water and Sewage Work in Perthshire.—The Water and Sewerage Committee of the district of Killin, Perthshire, have agreed to the extension of both systems, which is to be carried out from the reports, and under the superintendence of their engineer, Mr. Woulfe Brenan, M.I.C.E., Oban, N.B.

Improvements at Accrington. — The Accrington Corporation has decided to open out a new highway leading from Whalley Road to Burnley Road. This will involve the building of a bridge over the Lancashire and Yorkshire Railway. The cost, including improvements to Blackburn Road, will probably be about £50,000.

Altrincham Sewerage.—Mr. Herbert H. Law, Local Government Board Inspector, held an inquiry at Altrincham on Thursday, into an application of the Urban District Council for sanction to borrow the sum of £22,000 for the construction of a new outfall sewer, and the purchase of land adjoining the Council's present sewage farm at Woodcote, near Altrincham.

Lady Sanitary Inspector. — Miss Lizzie Marguerite O'Kell, of Bedford, who was educated at Queen's College, Harley Street, London, and holds the certificate of the Sanitary Institute, has been appointed sanitary inspector for Marylebone, her duties being chiefly the examination of the industrial establishments in the parish where women are employed.

A Bradford Deputation to France.—A meeting of the Bradford Sewage Defœcation Committee was held at the Town Hall on Thursday, Alderman R. Pratt presiding. It was resolved that a sub-committee, consisting of Alderman R. Pratt Messrs. R. Johnson, W. C. Dixon, and F. L. Croft, should be appointed to visit and report upon sewage purification by the Patent Benzine process, now in operation at Roubaix, France.

Ulverston Improvements.—Col. Slacke, R.E., an inspector of the Local Government Board, held a public enquiry last week respecting an application of the Council to borrow £1,900 for the purchase of land for the widening and improvement of Princess Street, at the junction of Bryer's Smithy; £2,750 for the purchase of the old Liverpool Bank premises, and adjoining property, in Queen Street, with the view of converting the same into new Council offices; and £1,050 for the purchase of penny-in-the-slot meters and gas cookers, and the extension of the gas main to Low Mill Tannery. There was no opposition, and the proceedings were of a formal character.

Bishop Auckland Water Scheme.—Owing to exacting demands made upon them from time to time by the Durham County Council, the Bishop Auckland Urban Council, at a cost of over £2,000, laid down a new filter bed on the Council's West Mill estate, and this was publicly opened recently. The Local Government Board have refused to sanction the borrowing of the money, and the cost will have to be defrayed out of the rates. It is intended to lay down a similar filter bed near the present new one.

Street Improvement at Blackpool.—Last Wednesday, at Blackpool, Colonel W. R. Slacke, R.E., a Local Government Board Inspector, held an inquiry into the application of the Corporation for sanction to borrow £9,156 for works of private street improvement. There was no opposition. The money is to be devoted to making new streets, which are already sewered and built upon. Mr. T. Loftos, the town clerk, and Mr. Wolstenholme placed the facts before the inspector, who was told that the amount of outstanding loans under the Sanitary and Public Health Acts was £396,266.

Street Widening Arbitration Case at Leeds.—The umpire (Mr. R. Horsfall, of Halifax) in the arbitration proceedings between the Leeds Corporation and Mr. John Myers for the purpose of assessing the amount to be paid in respect of an area of frontage land situated between the Smithfield Hotel and St. Thomas Street, which is required for the widening of North Street, has made his award. He fixes the amount at £1,859. At the enquiry, some time ago, the sum claimed by Mr. Myers was £2,838, while the witnesses for the Corporation estimated the value at between £1,152 and £1,230.

Huntley Sewage Scheme. — A special meeting of the Police Commissioners was held recently, for the purpose of considering the offers for the new sewerage. A letter from Mr. Barron, C.E., recommended the acceptance of the tender of Mr. J. M'Connachie which was £424 8s. 1½. £40 7s. 5d. would have to be deducted for a drain which is not yet to be proceeded with, leaving the full offer at £384 0s. 8½d. Mr. M'Connachie's offer was ultimately accepted, and a small committee, consisting of Provost Pirie, Baillie Sellar, and Mr. James Lemon, street convener, were appointed to consult with Mr. Barron as to the order in which the work was to proceed.

Private Street Improvement Case.—At the Skipton Petty Sessions on the 19th inst., a case of some interest to public bodies and property-owners occupied the attention of the magistrates for several hours. The Skipton Urban District Council some time ago, in connection with private street improvements, passed a resolution to make Belgrave Street, Gargrave Road, and the cost was apportioned to the several property-owners in that street. Twelve of these property-owners objected to the apportionment, and the Urban District Council, in accordance with the Act of Parliament, decided to lay the case before the local magistrates. Mr. R. Wilson, as clerk to the Council, conducted the case on behalf of that body, and Mr. Proctor, of Burnley, appeared for the objectors. After the town surveyor (Mr. J. Mallinson), and other expert witnesses had been called, the magistrates decided in favour of the Urban Council, and allowed them £3 10s. cost.

Sewage Disposal in India.—An experiment has just been brought to a successful conclusion in the Presidency Gaol, Calcutta, which is likely to have an important bearing upon the future sanitation of India. It has been to try the efficacy of the new aseptic pit system for the disposal of sewage. The aseptic pit, which has been very favourably reported upon at home, is uncommonly like the old unwholesome cesspit. It is managed, however, on scientific principles, and therein lies all the difference. The cesspit in the new system is a dark, underground chamber with well-luted sides, in which is cultivated the aseptic germ, a microscopic organism which has only to be introduced and supplied with a properly regulated flow of sewage to convert the evil-smelling products of the drains into harmless fluid. The sewage is allowed to remain in the pit just long enough to allow the necessary chemical changes to take place. This done, the product passes out through a rough filter of well aerated slag, where it becomes thoroughly deodorised, eventually leaving the apparatus in the form of a limpid and harmless product.

Health Exhibition at Lincoln.—In connection with this exhibition, a report of which appeared in our issue of August 16th, the Council of the Association decided to award silver and bronze medals for the two best exhibits of manufactures suitable for work in connection with the sanitary inspectors duties, also five certificates of merit in addition. The judges appointed were Messrs. T. J. Moss-Flower, C.E., F.G.S., Chairman of Council; T. G. Dee and W. H. Grigg, vice-Chairmen of Council; S. C. G. Fairchild; and the Hon. Sec., E. Tidman, C.E., F.S.I. The judges made a careful inspection of the exhibits on Monday, August 8th, and have made the following awards:—*Silver medal*—Messrs. Oates and Green, Halifax, Yorks., "For general excellence of the exhibits." *Bronze medal*—Messrs. Guest and Chrimes, Rotherham, Yorks., "For general excellence of the exhibits." *Certificates of merit*—Messrs. Wilson and Stockall, Bury, Lancs., "For their ambulance appliances;" Mr. C. Duckering, Lincoln, "For the general excellence of exhibits;" Messrs. Arnold and Co., Ltd., Lincoln, "For the general excellence of exhibits;" Mr. E. F. Arnold, R.P.C., Lincoln, "For exhibit of plumbing defects;" Messrs. Lockerbie and Wilkinson, Birmingham, "For the general excellence of exhibits."

An Architectural Causerie.

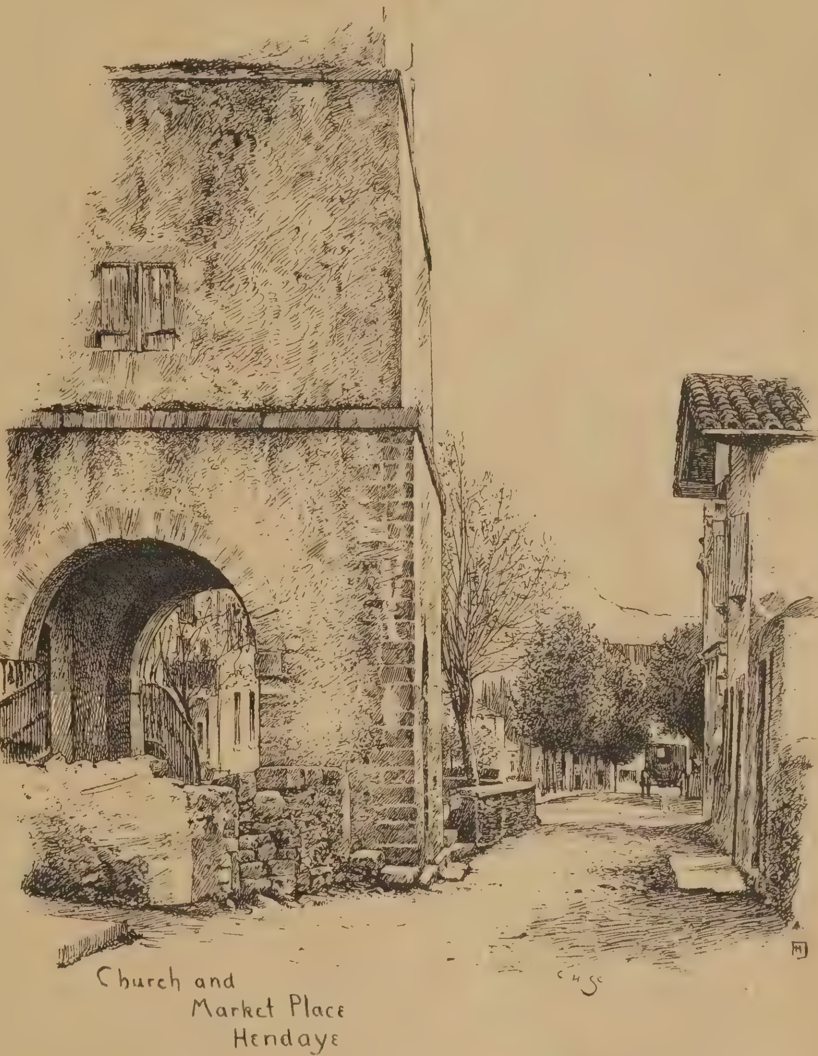
Colour Harmonies and the Course of the Seasons.

There is little doubt that one's usual surroundings exercise a great influence upon the taste, whether by way of contrast as begetting the desire for something different, or by way of similarity, the mind conceiving with difficulty great variation, or being unwilling to leave the familiar to try unknown combinations. Oriental nations, with the brilliant sunlight and sharp-cut shadows ever with them, delight in strong contrasts and combinations of colour, and the same effect is produced in others not so blessed by the constant companionship of the sea. One may instance the Venetians, the Earlier Norsemen, and our own nation. Perhaps in the second case the long winters with their carpet of white covering the ground may have helped by raising the desire for colour contrast, while utility may also have had its share in the necessity for distinguishing friend from foe and recognizing from afar the house of friendship.

One is accustomed to think that the modern perception of colour harmonies is more subtle and refined than that of days gone by, the epithets of Greek poets, for instance, showing small sense of accurate colour observation; and it is permissible to doubt whether the splendours of mediæval decoration would be satisfying to the modern eye if seen as they were when new, though the appearance of the few unrestored pieces to be still found here and there is so pleasing, Time having laid his harmonising hand upon them and dulled the too sharp contrasts.

Of the changes in one's surroundings which may affect one's perception of the beautiful, suggesting to the mind decorative forms and colours, those produced by the sequence of the seasons are at the same time the most prominent and universal. Winter comes with snow or rain, in either case suggesting strong oppositions and warm colour by way of contrast. The breath of spring goes forth over the land, which smiles responsive with blossoming orchards of pink and white, with bursting buds which flush the woods with a hundred delicate tints of purple, orange, yellow, and green, while sun and shower chase each other across the landscape with constant succession of blue shadow and golden light, and the distant hills put on their most beautiful colour. Summer follows, with its richness of roses and lilies and a thousand other lovely flowers, relieved against a background of dark full green, sometimes almost black, so deep is it, and the water lilies gleam in shady pool or among the reeds and bulrushes of the backwater; and then comes autumn, ruddy with orchard fruit and blazing in splendour of fading leaves, like the flames of a funeral pyre, which rise and sink and rise again in the wind till the final blasts scatter the last dying embers and leave the country stark and naked, waiting again for its snowy pall. Now the colour harmonies which satisfy in winter are not the same for which one longs in summer. In winter arrangements in which warm tones predominate are most acceptable, while in summer suggestions of coolness and memories of shady dells, where the blue sky peeps through the interlacing branches prove more charming—in fact, one may go farther than this; for on a summer's morning when the sun shines into a room, the walls of which are coloured a cool green or even a slaty grey, it is quite possible to feel happy and contented with one's surroundings, but let heavy clouds cover the sky and thunder peal and lightning flash, and one involuntary shrugs one's shoulders and glances around with discomfort, feeling the room chilly and cheerless—for in a minor degree the same remarks apply to sunny and shady rooms; the desire for warmth or coolness producing an appreciation of certain harmonies in preference to others which æsthetically may be just as admirable. And this suggests that in the selection of a scheme of colour for any decoration regard should be paid to the aspect and lighting of the room more than to the beauty and harmony of the arrangement viewed in the abstract. It is not enough to have a combination which shall be harmonious in itself—it must also be in harmony with the position of the room and the requirements which it is to fulfil.

A. W.



·DRAWN BY F. HAMILTON JACKSON, R.B.A. (*See p.* 67.)

Flint Castle. The performance of Shakespeare's Richard II., given by Mr. F. R. Benson in the grounds of Flint Castle in celebration of the quincentenary of that monarch's deposition by his cousin, Bolingbroke, has aroused some passing interest in that old ruin which impends so grimly over the estuary of the river Dee.

The Dee is an impressive river. When the tide is in, this magnificent waterway presents a grand aspect, marred only by the hideous railway bridge, of quite recent construction, which straddles across to Wirral, and by the coal mines and chemical works of Buckley and Flint, whose chimneys send a distant smirch of smoke across the sky. The scanty ruins of the once important Edwardian castle stand upon the shore, washed by every tide, and melting gradually away; but the massive angle towers and the sturdy curtain walls still give point to Shakespeare's excellently descriptive lines:—

> Go to the rude ribs of that ancient castle
> Through brazen trumpet send the breath of parle
> Into his ruin'd ears, and thus deliver:
> Harry Bolingbroke
> On both his knees doth kiss King Richard's hand.

Bolingbroke had returned to England after his banishment by the King, and, with a large following at his back, demanded the restoration of his estates and a revocation of the decree of banishment pronounced against him. To meet this imperious outlaw the King, who had been in Ireland, returned in haste. Delays, however, hindered the concentration of his forces; and finally those who had at first flocked to his banner dispersed, disheartened by the sinister reports that began to circulate.

Fearful of his safety, Richard assumed the grey habit of a Franciscan monk and crept off towards Conway. There, of all his followers, he found but the beggarly remnant of one hundred. To him, in this extremity, Bolingbroke sent, with fair promises, a cavalcade headed by the Earl of Northumberland, with an invitation to meet him at Chester. Richard, unsuspecting, agreed to accompany them as far as Flint. On their journey they came to a steeply descending road near the sea, and, dismounting, the King was proceeding down the road on foot, when he caught sight of men-at-arms lurking in ambush. "I am betrayed!" he exclaimed, in an agony of despair. "God of Paradise assist me! Earl of Northumberland," he continued, "If I thought you capable of betraying me, it is not too late to return." "You cannot return," replied the Duke, and so the King was lost.

The King's party reached Flint under close guard that evening, and, after he had dined, his captor made his appearance, bowing low, with mock humility. "My lord," he said, "I am come sooner than you sent for me; the reason wherefore I will tell you. The common report of your people is such that you have, for the space of twenty, or two and twenty years governed them very badly and very rigorously, and in so much that they are not well contented therewith. But if it please my lord, I will help you govern them better than they have been governed in time past," to which the unhappy King replied, "Fair cousin, since it pleaseth you, it pleaseth us well."

FLINT CASTLE. DRAWN BY C. G. HARPER.

Of course, this polite parley was but a solemn farce. The King was taken, in durance, to Chester, and finally thrust into Pontefract Castle, in whose dungeons he perished miserably at the hands of secret assassins.

Thus do the "rude ribs" of this ancient Castle of Flint wear an additionally impressive appearance to all those who have read the story of that ill-fated King. Nor do the ruins, apart from their associations, ever wear a cheerful aspect—black-browed and solemn as they are, brooding over the fateful, treacherous sands of Dee. C. G. H.

Back Numbers of the Builders' Journal Wanted.—The publisher would be much obliged if any readers who may have by them any copies of Nos. 105, 106, 107, and 108, dated February 10th, 17th, 24th, and March 3rd, 1897, of the BUILDERS' JOURNAL AND ARCHITECTURAL RECORD, which they are able to spare, would kindly send them to him, as these are required for office purposes. A copy of the current number of the *Architectural Review* will be sent as an acknowledgment of the courtesy.

On Reflection.

Architecture and Health.

IN a recently-published Home Office blue book on the making of phosphorous matches there is a passage which is not without significance for architects. The passage in question occurs in a report by Dr. Talbot, the medical officer of health for Bow. Dr. Talbot has compared two factories as regards the prevalence amongst the workpeople employed of the terrible disease phosphorus necrosis, popularly known as "phossy jaw." He finds that in one of the two firms in question large sums are spent on medical and dental supervision, and yet the cases of the disease are far more numerous than in the other where these precautions do not seem to be taken; in fact, in the second factory the disease is almost unknown, only two mild cases having occurred in fifteen years amongst the 500 workpeople employed. From these facts, supplemented by a careful inspection of many other match factories, Dr. Taylor has been led to the conclusion that the comparative immunity of some factories as compared with others is due not so much to medical supervision as to the different methods of using the phosphorus consequent upon the different structure of the buildings. Where the arrangements allow of the dipping and mixing (the dangerous part of the work) being carried on in the open air, or, at any rate, in a building separate from the other departments, the danger is greatly lessened. These investigations point to the great need for architects when planning factories to give careful study to the processes of manufacture to be carried on in them. The architect who builds a factory has to be extremely practical and utilitarian, and perhaps even to do violence to his artistic sensibilities. But by way of compensation he may, if he will, have the satisfaction of knowing that by judicious planning and right methods of construction he has rendered "dangerous" trades almost innocuous, and increased the health and wellbeing of, perhaps, many generations of workers.

The Government and Architecture.

OUR leading architects—those great and gifted beings, we mean, who obtain Government commissions—will have a bad quarter of an hour when they read their "Fortnightly Review" this month. For Mr. Charles G. Harper has been surveying their works with his critical eye, and setting down their shortcomings with that trenchant pen of his, which nothing extenuates. We learn that Mr. Alfred Waterhouse, if he did fairly well with the Natural History Museum, achieved a melancholy failure with the City and Guilds Institute; Mr. Aston Webb has ranged the world over in quest of designs for his Victoria and Albert Museum, borrowing a tower from this building, a pavilion from another, and a range of windows from a third; the designs by Mr. Brydon and Mr. Young for the new Government buildings in Parliament Street and Whitehall are damned with faint praise, but as for recent examples of Post Office architecture Mr. Harper can scarcely find language bad enough to characterise them. Altogether they are a sorry lot—these great and gifted ones—and in their hands architecture is a living and progressive art no longer. It should be explained that Mr. Harper does not set out to "deal faithfully" with latter-day architects; it is only incidentally that he performs that painful duty. The object of his article is to point out how successive governments have neglected the arts, and especially architecture; how, when two courses presented themselves, they have perversely chosen the worse; how they have spoiled fine schemes with their hide-bound officialisms; how they have procrastinated and delayed, practising cheese-paring economies which have often proved costly extravagancies in the end. The indictment is one which in its main lines will not be unfamiliar to our readers, but it may serve, perhaps, as an eye-opener to the general public who do not read professional journals. Mr. Harper's article consists very largely of a simple recital of indisputable facts, and can hardly fail to convince the candid reader that in the matter of the provision of public buildings we have time after time left undone those things which we ought to have done, and done those things which we ought not to have done. Mr. Harper is the more likely to be listened to that his criticism is directed not against this government or that, but against an official tradition to the deadening influence of which all governments in this country—both Liberal and Conservative—seem to succumb.

Art in Belgium.

THE recent Vandyck celebration at Antwerp afforded us an opportunity of pointing out the widespread interest taken in artistic matters by the inhabitants of the little kingdom of Belgium, an interest which is in striking contrast with the indifference displayed by the masses of the population in this country. An even more striking illustration of the artistic sensibility of the Flemish people is afforded by a remarkable art exhibition lately opened in Ghent. The exhibition in question is not a mere local collection, but an International Art Exhibition of genuine importance, including as it does works of eminent British, French, Belgian, Dutch, and Spanish artists, selected evidently on a broad and Catholic basis, and hung in striking and admirable contrast with the haphazard methods of Burlington House. We, of course, are not unaccustomed to provincial art exhibitions, but the spectacle of a small provincial town organising a large international picture show of equal importance to that recently held at Knightsbridge is one that has no parallel in this country. The Flemish method of celebrating the artistic giants of their race—a week of festivals and street pageants—is one which we are not likely to emulate; indeed, judging from a recent article in the Paris "Figaro," it seems to fill even their artistic neighbours, the French, with amazement. We might, however, acclimatise their system of peripatetic exhibitions so as to give dwellers in the provinces an opportunity of seeing the pictures from time to time exhibited in London. If it were possible to rely on a sufficient degree of artistic interest amongst the English people to render such a venture financially successful, there would seem to be no reason why a picture gallery should not be sent on tour through the provinces just as is done with the best plays from the London theatres.

SPAIN:

Picturesque Cities & Monasteries in the North.

By F. HAMILTON JACKSON, R.B.A.

(Concluded from page 371, No. CCXXXIII.)

No. X.—HENDAYE AND FUENTERRABIA.

MOST of the Spanish railways run through fine scenery, the conformation of the country making it impossible to go any great distance without encountering a mountain range. The great towns, which were the capitals of kingdoms in mediæval times, generally lay in the plain, and to pass from one to another means surmounting or piercing the mountain ranges which divide them. Consequently railway travelling in Spain is exceedingly interesting, and one does not mind the deliberation of the trains by day (a slowness which has been much exaggerated, by the bye), for there is almost always plenty to observe and admire. And the long stoppings at the stations when the soldiers and country folk swarm around the "cantina," while annoying and wearying to the traveller whose journey is caused by business, or who desires for other reasons to get to his destination as quickly as possible, give the simple tourist the opportunity of seeing a great deal of the life of the countryside, if he be observant.

The line from Burgos to the frontier is no exception to the general rule. After leaving Castile it runs through the Basque provinces which are well timbered in many places, and the scenery of the hill ranges is very fine. The country near Burgos I am unable to describe, for we journeyed in the opposite direction, and night fell somewhere about Pancorbo; but from Miranda del Ebro, the last Castilian town (where one can buy simple food and pure wine incredibly cheap), the scenery is picturesque and interesting, becoming more so as the Pyrenees are approached. In the afternoon sun, the blue distances of finely-shaped mountains are lovely, the foreground, at least in spring, being of varied orange and tender green tints. The streams are bordered with trees, and the roads cross them by grey, ancient bridges of excellent design. The most picturesque part of the route lies between Vittoria and Tolosa Here the line pierces the mountain ranges, running up and across valleys, giving the traveller an excellent opportunity of appreciating the beauty of the landscape. One passes little streams brawling over their rocky beds beneath steeply precipitous banks, anon a weir checks their flow and they gather into still pools, on the other side of which may be a mill with a few cottages grouped around it almost the same colour as the rock behind them, and often scarcely distinguishable from it, or with a green meadow sloping to the stream and a few fine trees overshadowing it. Nearer the top of the pass one looks down upon ranges of hills with great masses of rock protruding from their slopes, and with trees scattered about, while everywhere excellent roads are seen which wind up and down, and appear and disappear round the spurs of the hills.

Near San Sebastian the land-locked bay of Pasajes is passed, an excellent harbour and a most picturesque place, and the frontier towns of Irun and Hendaye are soon reached; these stand on the Bidasoa, the river which divides Spain from France, Irun being the higher, where the frontier bridge crosses the river.

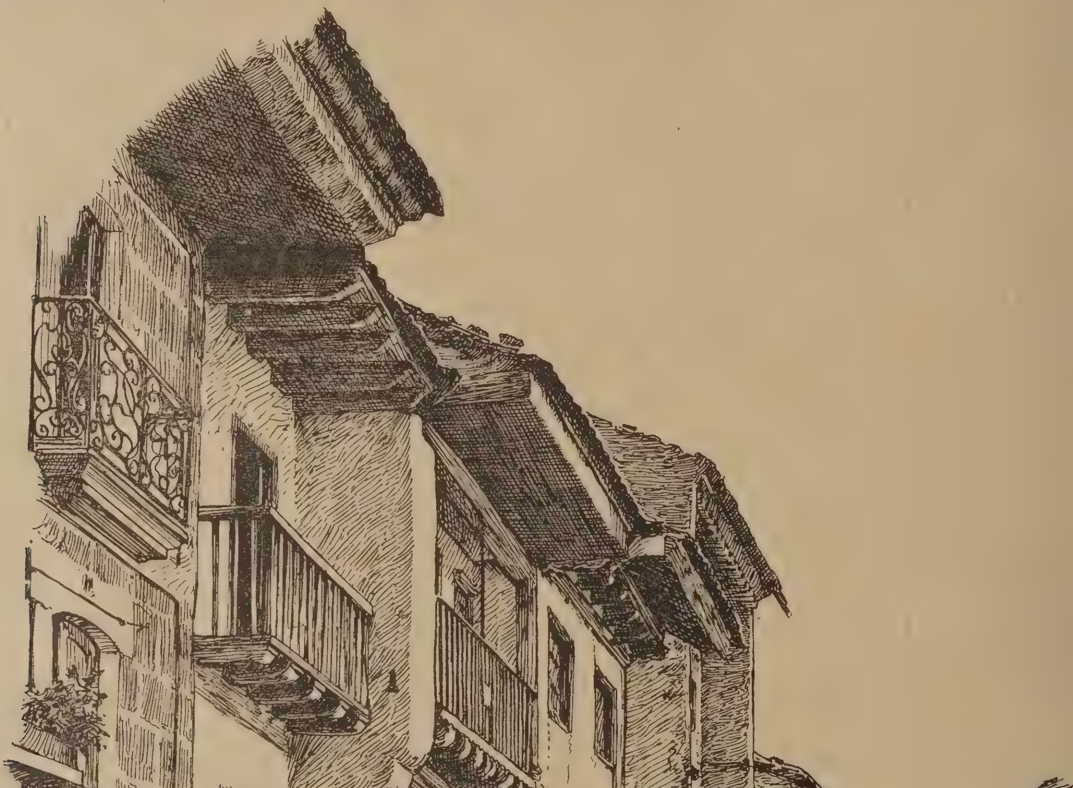
Hendaye on the French side and Fuenterrabia on the Spanish, look across the tidal river at each other from the rising ground on which each stands, both with their teeth drawn; for the Spanish fortifications were destroyed by the French in 1794, and at Hendaye there are only a few ruined bastions, overgrown with grass and brambles. In the river a gunboat lies close to the Spanish shore, and the sailors are often to be seen in the streets of Hendaye or in the market place, and fine, smart men they appear to be. The river is 14ft. deep at high water, but when the tide is out boats have to pursue a very winding course, with continual danger of sticking on the sand and mud banks. When this occurs one of the crew gets overboard and "shoves behind." The boatmen do not trouble to row at low water, but, standing, make use of the oar in a manner something between an English punter and a Venetian gondolier. They are a very mixed race, and one frequently comes across Basque types which might be Scotch, not in the least like one's preconceived ideas of the people of Spain or the south of France. It is as surprising as the first sight of a blonde Jew. Across this river Wellington led his army at low tide to attack Soult, who was posted on the slopes above Hendaye and expecting nothing so little. The resulting victory was one of the last feats of arms of the Peninsular war.

DRAWN BY F. HAMILTON JACKSON, R.B.A.

A little island in the river between this place and the bridge at Irun, the Ile de la Confèrence, called by the Spaniards for some reason the Isle of Pheasants, has been the scene of many royal meetings and conferences—lying between the two countries of France and Spain it is in a sense neutral ground. In 1463, Louis XI. of France and Enrique IV. of Castile met here to negotiate the marriage of the Duke of Guienne, when the paltry dresses of the French courtiers excited the contempt and indignation of the magnificently-attired Castilian noblemen. Here, in 1526, the exchange of Francis I., then prisoner to Charles V., against his two sons, who remained as hostages, took place. Here, in 1645, Isabella, daughter of Henri IV., and afterwards wife of Philip IV., was exchanged against the latter's sister Anne of Austria, as wife for Louis XIII. Here Louis XIV., in 1660, had a first interview with Maria Theresa, which was quite contrary to etiquette, and here the treaty of the Pyrenees was drawn up by Cardinal Mazarin and Don Luis de Haro. This was the most noteworthy event of the whole number, for Velasquez fitted up the saloon for the conference between his master and Louis XIV., and while doing so caught the fever from which he died.

For the traveller who enters Spain from this side it is well to stay the night at Hendaye, and make arrangements to see Fuenterrabia as his first Spanish town. It is extremely picturesque, and more Spanish looking than most of those between the frontier and Burgos. The boat pursues its devious course, following the deep water channel, and discharges its passengers on the shore nearly opposite the Spanish gunboat. Facing this vessel is a sort of landing place, with steps by which to ascend to the top of a river wall, and one naturally makes for these steps, only to be sternly waved away by a couple of soldiers on duty, and commanded to tramp a quarter of a mile along the muddy beach, accompanied by numerous boys who point out the best way of going with great zeal and expect corresponding "backsheesh"; the experienced traveller refrains from gratifying them. One reaches dry land at last by some little steps close to a sort of fish store—to judge by the smell!—from which a very good view of the outside of the town may be had, with the church tower most picturesquely crowning the hill. This tower is not very admirable from the architectural point of view, but, like many other such works in Spain, it is picturesque in its place. Bending to the left, without molestation from the custom-house officials, one passes a very unusual sort of rope-walk, wherein the labour is carried on under the pleasantest conditions.

A kind of pergola has been made of plane trees by training the branches towards each other, and inarching them, so that the whole of the trees are organically united; the branches being kept trimmed and pruned, throw out each year numerous short shoots, covered with leaves, which make a thick verdant roof, and the cool breezes blow without let or hindrance from side to side and end to end. In a plaza at the top of the town I saw the same arrangement, with seats placed beneath, and something resembling it also at Hendaye—but nowhere else. By a steep ascent the town gate is reached, after a sharp turn to the right. It is commanded by the walls on one side and by a tower on the other, lying in a deep re-entering angle, and bears above the archway the arms of the town carved in relief, a sundial, and a long painted inscription giving every information as to the name of the city (for it is a "Ciudad") and its judicial and provincial belongings, headed by a marvellous array of initials, M.N.M.L.M.V.Y.M.S.F., the meaning of which I am unable to interpret; a fig tree grows in the wall close by. The arms show an angel holding a key, a whale, and two syrens, and a castle between two stars. These were bestowed upon the town by Philip IV. in 1638, when the Prince of Condé was repulsed by the Admiral of Castile. At this time it was an important frontier fortress, and was placed under the protection of the Virgin of Guada-



Fuenterrabiá

DRAWN BY F. HAMILTON JACKSON, R.B.A.

lupe. The name Fuenterrabia is corrupted from the Latin "fons rapidus," because the town is situated on the swiftly flowing Bidasoa. It has a population of about 2500, most of whom appeared to be in or about the principal street on the occasion of my visit, for it chanced to be the morning of Easter Eve, and I had the opportunity of seeing one of the church pageants which we never see in England.

About half-way up the street on the left side is the town hall, and from the arcade on the ground floor a procession started which purported to represent the Roman soldiers on their way to guard the sepulchre, which was arranged in the church in front of the high altar. At the head were several musicians with French horns, on which they played a slow, mournful march, and the soldiers (who were dressed in imitation of Romans) let the butts of the spears which they carried fall with a crash on the stones at the commencement of each bar of the music. At a near view the get-up was rather over-theatrical for daylight, but from the bottom of the gloomy street, with its many overhanging eaves and balconies, tenanted by spectators, rising to the church tower at the upper end, the terrace in front of which was also crowded with the townsfolk, the procession both looked and sounded distinctly impressive. On entering the church the men took up their positions to right and left of the altar, the centurion kneeling in the centre by the effigy of Christ, and some service was gone through, after which the excitement appeared to be over and the crowd dispersed, leaving the soldiers watching by the tomb.

FUENTERRABIA FROM LANDING PLACE.

Above the church is a plaza, one side of which is occupied by the castle, which was built in the tenth century by the King of Navarre, Sancho Abarca; but the façade towards the plaza is now of the sixteenth century, and the one to the side was rebuilt by Charles V. There are many balconies both of wood and iron, wrought and cast, and most of them are good in design; also many large coats of arms, treated in a decorative fashion, carved upon the fronts of the houses. In mediæval times, the working of iron was an important industry of the town, both for home consumption and for export. There is record of a gun called "Columbyne," which was cast for our Henry VIII., at "Fountrabye in Spaine," at a cost of £18 10s. 0d.

The coast from hence to San Sebastian is very stern and forbidding, and the long Atlantic rollers break upon the beach with a splendid display of foam, as they do at Biarritz, the rumble being audible for some distance inland; but it is from Hendaye that one gets the sea view, Fuenterrabia lying a little way up the river, masked by a projecting headland; and, of course, there are the usual French watering-place erections on the shore there. The village, or town, is much of it quite old, and many of the houses bear a certain resemblance to Swiss and Tyrolese buildings, but without the lavish use of external woodwork which often characterises them. There is a fine road, which winds along above the river, from which a good view of Fuenterrabia on its hill may be seen, with a mazy foreground of winding channels through the sand at low water. Along this road many of the country people may be met with in the early morning, bringing small wares to market—a woman with a white hen under one arm and some eggs or green vegetables in a basket on the other; others with pots on their heads, walking with stately step; a boy with mushrooms in a basket, or with carrots and leeks; or a man and a boy with a donkey laden with other produce. Perhaps a bullock cart may come by drawn by a yoke of beautiful pale brown beasts, their horns wound about with a skin—one man walking in front with a goad or staff, and another behind with the cart, which may be loaded with wood, or have a couple of calves in it, or some little pigs. I did not see among the wares the liqueur for which Hendaye is celebrated; it must be sought in the shops. The market is held in a long "place," near to the church, under the shade of small plane trees, and is a very busy scene up to ten o'clock. The costume of both

DRAWN BY F. HAMILTON JACKSON, R.B.A.

men and women is strange to English eyes, though there is a good deal of Manchester point visible. The women wear a handkerchief bound tightly round their heads, sometimes black, sometimes of rich and bright colours, which often entirely covers the hair. They also wear a curious sort of sandal shoe made of felt, which is worn by the men too, the ties varying according to taste apparently.

The church is very curious in its internal arrangement. There are three wooden galleries, which run round three sides, leaving the east end free, one above the other, like the circles at a theatre, and from the lowest the pulpit projects, having its special staircase. The wood work is quite Swiss in appearance, the fronts of the galleries being just like the fronts of balconies and external galleries in Switzerland. That at the west (which contains the organ) is supported by two octagonal stone pillars, around which the basins are arranged to hold the holy water. The staircases to the galleries are external, and start close to the west door, which opens under the tower, the lowest storey of which forms an enormous open porch. There are a few remnants of bastions down by the water, as has been remarked, and one house near the church appears to occupy a tower which belonged to the ancient walls, but these are all now left to testify that the place once had military importance. Around tower the lofty mountains, and to the south-west is seen the broken line of the spurs of the lower chains of the Pyrenees, among which the two streams which, united, make the river Bidasoa, take their rise.

BUILDERS' JOURNAL COMPETITION.

DESIGN BY "THISLIXUM."

THE following notes accompanied the design by Mr. Thomas H. Smith ("Thislixum") which we reproduce this week in our centre plates :—

This design comprises on the ground floor: Hall to be used as sitting-room, with staircase and gallery round three sides, study, boudoir with ingle nook, dining-room with bay and ingle, lavatory, w.c., and usual domestic offices, cycle house and kitchen yard.

On the first floor: Six bedrooms, three servants' bedrooms, two bathrooms (one for the use of the best bedroom), and w.c.

The servants' bedrooms are shut off from the rest by a door in the corridor. The bathrooms, lavatory, and w.c. adjoin, and are placed over the lavatory on the ground floor, and with the exception of the kitchen sink waste, all the drainage is kept on one side of the house. The best rooms and the chief of the bedrooms have been placed on the south-east side as the most cheerful. The hall has an open timber roof, and a large ingle nook under the gallery. The trusses, rafters, and wall pannelling to be executed in oak slightly fumigated to a deep colour.

A verandah is placed on the south-east side and is reached from the bay in hall. The door is so placed as to prevent draught. Access to the balcony above is from the landing on the stairs.

Red bricks, rough cast, and unwrought half timber work, together with straw or reed thatch and pan tiles for the roofs are the materials employed externally. The rough cast to be lime-whited, and the timbers stained black. The roof at eaves to project about 2ft. 6in., and 1ft. 3in. at gables. The entrance doors to be painted sage green and twice varnished. The rest of the external joinery to be painted white. The joinery to reception rooms to be finished in flatting coats. All other joinery to rooms to be painted. The windows to be glazed with clear glass in leaded lights in squares of 5in. or 6in. wide and about 7in. high. The cost is estimated at £2,050.

ASSOCIATION OF MUNICIPAL AND COUNTY ENGINEERS.

WATER AND DRAINAGE WORKS AT PORTLAND.

THE Western Counties district meeting of the Association of Municipal and County Engineers was held at Portland on August 26th. The members met at the Royal Hotel, Weymouth, where the business proceedings of the meeting were transacted. Mr. W. Harpur presided. Mr. J. Lano, chairman of the Portland District Council, welcomed the members of the association to the ancient manor of Portland. Mr. Hall, at the proposal of Mr. Yabbicom, was re-elected honorary district secretary. Subsequently a paper was read by Mr. Ernest J. Elford, surveyor to the Urban District Council of Portland, on new Portland

Water and Main Drainage Works.

He said that the water question had been a source of worry to the local authorities for several years. In 1871 the Local Board pledged themselves to supply a pure and adequate supply and an efficient system of drainage, but nothing was done until 1889. Then the matter was earnestly taken in hand, and it was decided to sink a well near the village of Southwell. The work was begun in 1891, and the shaft was sunk to a depth of 206ft. After a period of thirty-five days' continued pumping from the well, the average yield was found to be at the rate of 116,000 gallons per twenty-four days. Dr. Frankland, analytical chemist to the Local Government Board, was furnished with a sample of the water, and reported that it contained a large proportion of sea-water, mixed with land containing a considerable amount of decomposed sewage. This was a surprise and a disappointment, and as the works had already cost about £7,500, the Council were placed in

An Awkward Position.

In spite of difficulties, however, they considered it their duty to give the district an efficient supply of water. He recommended the Council to abandon their scheme as he thought it was impossible for them to obtain an adequate and pure supply. Subsequently the Council were approached by Captain Gould, who offered to sink a well and obtain a sufficient supply of water on his estate at Upway. The well was sunk, and in February, 1896, water was found at a depth of 20ft. below the surface, and on March 10th and 11th, a test of twenty-four hours continued pumping resulted in a total yield of 400,000 gallons. The council therefore decided to take over the well, and sank it to a further depth of 6ft. with Captain Gould's permission. The yield came up to 750,000 gallons in twenty-four hours. Dr. Frankland examined a sample of the water and reported it to be of excellent quality and *above the average* of chalk waters. On July 2nd a letter was received from the Local Government Board requesting the Council to at once discontinue the test pumping and all other works connected with the well, and informing them that the Board would not sanction the borrowing of any money for the construction of waterworks to be supplied from the well, "because of the possibility of contamination from the village churchyard." This churchyard had practically been in disuse for many years. It was situated at a distance of about 100 yards from the site of the well, and on the opposite site of a valley through which a stream of water flowed, and on a bed of practically impervious soil about 10ft. thick. The Council felt that it would no doubt cause great delay, and would probably be useless to oppose the Local Government Board, and they therefore immediately entered into negotiations with Captain Gould to acquire another site upon which to sink a well. Ultimately

A Fresh Site

was agreed upon and sanctioned by the Local Government Board after three visits had been made by their inspectors. A loan of £500 was obtained and a contract entered into with Messrs. B. Coode and Co., of London, for sinking the well and subsequently carrying out thirty days' test pumping. On the same day as that upon which the Council sealed this contract, notices were published of the intention of the Weymouth Water Company to apply to Parliament in the ensuing session for powers to supply certain parts of Portland, including the Government establishments. The people of Portland keenly resented this effort of a local monopoly to take from them their powers and privileges, and render ineffective their endeavours to put into operation the powers the legislature has conferred upon them. In the meantime the well at Upway was sunk to a depth of 100ft, and a 12in. borehole to a farther depth of 70ft. The test pumping was then proceeded with and resulted in

An Average Yield

of about 280,000 gallons per day, being 80,000 gallons in excess of the quantity required by the Local Government Board. A sample of the water was sent to Dr. Frankland, who reported that "this water possesses an extremely high degree of organic purity and is of the most excellent quality for dietetic use." The Weymouth Company's Bill passed its second reading in the House of Commons and was referred to Committee. The Committee stage lasted about three weeks. Unfortunately the Admiralty supported the Company, and in the end a compromise was effected under which the Company obtained powers to supply the Admiralty with a limited quantity of water for fifteen years; the Council to have the right to lay the mains required for this purpose, which would lie within their own district, and also the right to take the water from the Company at the boundary of their district and themselves supply it to the Admiralty. The Council were successful, therefore, in their endeavour to keep the Company outside the island, but their effort to keep out the Company's water entirely was only rewarded with partial success. Mr. Elford then proceeded to prepare *his scheme in detail*, and the Local Government Board was asked to sanction the raising of a loan of £37,500 to construct the necessary works. The works were commenced on April 7th last year, and included the sinking of the well to an additional depth of 66ft. and the driving of headings, the construction of the pumping station, and provision and installation of the machinery and boilers, the construction of the service reservoirs, and the provision and laying of about 20 miles of cast-iron pipes.

The Total Yield

of the headings at the time of writing was 140,000 gallons daily, but as the yield of the shaft had decreased (owing to the dry season) to about 260,000 gallons, the total yield did not exceed about 400,000 gallons a day. The quantity of water which the Local Government Board required to be provided was 200,000 gallons per day. His scheme for the drainage of Portland had formed the subject of a Local Government Board inquiry on May 26th last, which was held by Mr. Boulnois, who expressed satisfaction with the scheme. The total

Cost of the Scheme,

including the renewal of all old sewers, was estimated at £24,000. Unfortunately, the Council were not at the present time in a position to borrow this sum without so far increasing the total amount of outstanding loans as to exceed the limit of double the rateable value. They intended, therefore, to commence immediately the construction of the most urgent portions of the works, and in all probability by the time these were completed the amount of the present loans which would have been paid off, together with the increase in the rateable value, would be sufficient to enable them to borrow the sum necessary to complete the whole scheme.

Subsequently a visit was paid to Portland, where the torpedo works and workshops at Portland prison were gone over.

DISPUTED POINTS UNDER THE LONDON BUILDING ACT.

By GEORGE H. BLAGROVE,

Certificated Surveyor under the Act; Author of "Dangerous Structures," "Shoring and its Application," &c.

I.—THE USES OF BUILDINGS.

THE London Building Act, 1894, is distinguished amongst our building laws for its minutely regulative character. Since the Act of 1855 successive Amendment Acts and by-laws have from time to time assisted to extend the scope of regulative supervision; and now we have an Act more far-reaching and comprehensive than any which have preceded it. Some of its provisions are only beginning to be understood amongst architects and builders, while the general public are still in ignorance of regulations closely affecting the internal arrangement of their homes. Occasionally owners of buildings are surprised into indignant protests against what is regarded as undue legislative interference; and it cannot be denied that anomalies, and even hardships, will arise in isolated instances through the application of some sections of the Act; but, on the whole, it must be pronounced to be a beneficial measure, conceived in a broad and liberal spirit, with a due regard for the various interests affected.

A marked feature in the present Act is the stress which it lays upon the uses of buildings or parts of buildings. It has become almost impossible to plan a building in conformity with the Act without knowing the precise purpose for which each part of it is intended. But building speculators are not always willing to decide beforehand the uses to which their buildings shall be applied; they would rather leave such questions to be settled according to the wishes of future tenants. Under such circumstances an architect may be placed in an awkward position. Will he guarantee that the majority of the rooms will be let as offices or counting-houses? If not, he cannot claim the exemption provided in Section 39 as to open spaces in the rear of buildings. Is he sure that all the rooms over a shop will be let exclusively for trade purposes? If not, when the building exceeds 1,000 square feet in area he must separate the part used for trade from the other part by means of fire-resisting floors and partitions, and must provide fire-resisting approaches, &c., to the residential part. Can he undertake that certain lower rooms will not be occupied, either as bedrooms, or as living rooms during the day? If not, he ought to sacrifice such portions of his building as would intercept a certain angle of light to certain windows, according to rules explained in Section 45.

What is a Domestic Building?

It is sometimes difficult to distinguish between a domestic building, a public building, and a building of the warehouse class. In a case that came under my notice a professional institution, to which members obtained admittance by payment of an entrance fee and annual subscription, was classed as a domestic building apparently because it contained some rooms which might be let for residential purposes. Had it not been for this circumstance, I should say that it would have been a building of the warehouse class, which is defined in Section 5 (28) to mean "a warehouse," &c., ". . . and any other building, exceeding in cubical extent one hundred and fifty thousand cubic feet, which is neither a public building nor a domestic building." It could not have been classed as a public building because the public had no right of entry into it, either by payment or otherwise.

A Stable is a Domestic Building.

That a stable is a domestic building, even when it does not comprise living rooms, was decided in the case of *Hewitt* v. *Kirk and Randall*. The magistrate arrived at his decision by what I would call a process of elimination. He said: "In the interpretation clause the Act says—I speak generally—a public building or warehouse is not domestic, and by Section 39 it says an office or counting-house is not domestic,* which leaves it to be inferred that all other buildings must be so considered. . . . The space occupied by the new building . . . is 111,555 cubic feet, which takes it out of the warehouse class, which must exceed 150,000 cubic feet†; and it is not constructed to be used as an office or counting-house, and it is not a public building. The preamble of the Act speaks of securing more light, air, and space round buildings, and that may perhaps be a reason for excluding buildings where people do not generally dwell, but might well include buildings like the present where horses are stabled."

The question naturally suggests itself, whether a stable building which exceeds 150,000 cubic feet in extent, and comprises no living room, should still be classed as a domestic building? Common sense suggests that if the open space in rear required under Section 41 is necessary for a small stable, it is equally so for a large one. Most district surveyors appear to hold this view, and I am informed that they are supported in it by the expressed opinion of legal advisers to the London County Council.

A Stable Can be a Building of the Warehouse Class.

Notwithstanding that a stable is a domestic building for the purposes of Part V., it appears that it may, under some circumstances, be a warehouse building for the purpose of determining the thicknesses of its walls. A case came under my notice in which the cellars under a brewery were connected with a cellar under a stable by means of a subterranean passage which formed a rolling way for casks. The district surveyor claimed that the stable building was a part of the brewery, and that the thicknesses of its walls must be regulated by Part II. of the First Schedule of the Act. The point was not contested, and I do not think that it could have been with success.

Trade Uses.

The fact that a building is used for purposes of trade or manufacture does not necessarily bring it within the warehouse class; for there are many trades which may be termed domestic, inasmuch as they may be carried on in dwelling-houses. The house in which a tradesman lives over his shop is certainly a domestic building; and it would come under the same designation if its upper rooms were let as offices, or for purposes of domestic trade. The use of rooms as offices must rank as domestic use; for Section 39 provides that buildings used wholly or principally as offices or counting-houses are not domestic buildings for purposes of Part V. (relating to open spaces); and the inference is that they are domestic buildings for purposes of every other part of the Act. The question, whether a shop should rank as an office for purposes of Section 39, has been disputed; but it appears to me that the mere fact of a shop containing a cashier's desk should not entitle it to rank as an office. If this be the true view—and I have known it maintained by district surveyors—it ought to follow, conversely, that an office or counting-house is not a shop within the meaning of the Act.

What is a Dwelling House?

The question of trade uses gives rise to complicated conditions, at times, in cases under Section 74—2, especially when old buildings are adapted as shops. This section, it will be remembered, provides that "in every building exceeding ten squares in area, used in part for purposes of trade or manufacture, and in part as a dwelling-house, the part used for the purposes of trade or manufacture shall be separated from the part used as a dwelling-house by walls and floors constructed of fire-resisting materials, and all passages, staircases, and other means of approach to the part used as a dwelling-house shall be constructed throughout of fire-resisting materials." It has been doubted whether part of a building consisting only of offices used during the day should be deemed to be used as a dwelling-house for purposes of Section 74—2. Section 5 (25) defines a dwelling-house as a building used "wholly or principally for human habitation." Does use as an office, then, amount to habitation within the meaning of the Act? An "inhabited" room, according to Section 5 (37), means a room in which some person passes the night, or which is used as a living room. The latter expression would appear to mean a room which is occupied continuously during the day, and would therefore include an office. So far as my experience goes, offices and workrooms are generally regarded as habitable rooms within the meaning of the Act, while rooms for occasional use only, such as for meals, &c., are not so regarded.

That occupation as offices is equivalent to use as a dwelling-house for purposes of Section 74—2 may be inferred from Section 74—3, which provides fire-resisting construction in buildings exceeding twenty-five squares in area, and containing separate sets of chambers or offices; for it appears to be the intention of the Act to provide fire-resisting construction for the protection of persons occupying offices, whether sleeping on the premises or not. At the same time, with regard to the requirements of Section 74—2, it is conceivable that a building might be used in part for purposes of trade, and in part for purposes other than trade and other than as a dwelling-house.

The Case of Carritt v. Godson.

In the recent case of *Carritt* v. *Godson*, the question of what constitutes use as a dwelling-house under Section 74—2, was decided in the High Court in regard to a public-house. I wish to draw attention to the special and limited character of the decision. The building in question exceeded ten squares in area, but the Court held that it was exempt from the requirements of Section 74—2, on the ground that the entire premises were licensed, and were used, in some sort, for the entertainment of guests; so that the part used for trade could not be separated from the part used as a dwelling-house. One of the judges took notice of the fact that there was a fire-resisting staircase leading into a yard, which could afford means of escape in the event of a fire. May we suppose that his decision was in any way influenced by this fact? At any rate, this decision cannot be construed to mean that a public-house is not used for trade purposes within the meaning of Section 74—2, nor does it appear to affect the case of a house not fully licensed. We may therefore watch with interest the results of any other case of the kind which may be brought into a court of law.

(*To be continued.*)

---

* Only for purposes of Part V.

† See Section 5 (28).

North Walsham Town Hall was Burnt Down last Sunday week. All the furniture and County Court fittings were destroyed.

A Memorial to Soudan Soldiers was unveiled recently in St. Nicholas Cathedral, Newcastle, by the Duke of Northumberland. The memorial is a brass tablet.

New Theatre for Walsall.—The foundation stone of a new theatre to be called Her Majesty's has just been laid. The cost of the building, which is being erected by Messrs. Whittaker and Co., from the designs by Messrs. Owen and Ward, of Birmingham, will be between £20,000 and £30,000.

New Bridges at Glasgow.—The Bridges Sub-Committee of the Statute Labour Committee have agreed to recommend that the contract for the two new bridges over the Clyde at the East End, to be constructed of the material from the present service bridge at Jamaica Street, be given to Mr. William Kennedy, of Partick. The cost is over £7,000.

Proposed new Workhouse for Southwark.—The Local Government Board have written to the St. Saviour's (Southwark) Guardians a letter refusing to sanction the purchase of forty-three acres of land at Burnt Ash Hill, Lee, for the purpose of erecting a workhouse. £500 an acre was to be given for the ground, and the total cost was estimated to be £150,000.

MODEL ANSWERS TO EXAMINATION QUESTIONS.

Answers to Questions set in the Examination held by the Society of Architects in April, 1899.

BY G. A. T. MIDDLETON AND R. W. CARDEN, ASSOCIATES R.I.B.A.

(*Continued from page 26, No. CCXXVI.*)

NOTE.—*It should be understood that the sketches given in this series of papers are purposely only very roughly finished, as the amount of work candidates are expected to do is so utterly out of proportion to the amount of time allowed. At the same time sketches should show sufficient detail to emphasize all the principal points. The sketches are reproduced on a reduced scale; they should, of course, be drawn considerably larger.*

II.—ARCHITECTURAL HISTORY.

(Part II.)

5. *Describe briefly and give outline plan, and elevation of one bay of nave from one of the following cathedrals: Ely, Peterborough, or Durham.*

ELY.—The present cathedral at Ely dates back to 1081, but only a small portion of the work of this period remains. The nave is Norman, and, as is usually the case with these buildings, only the aisles are vaulted, the nave itself being covered by a flat timber roof. The transepts are Early English, approaching almost to Decorated. The choir and lady chapel are Decorated, and peculiarly rich and elaborate specimens of the style. It has a square east end, and the lady chapel is situated just beyond the north-east angle of the north transept. It is in the treatment of the crossing that the chief interest of this cathedral lies. Originally it had been crowned by a massive tower, but this fell down and was replaced in 1322-42 by an octagonal lantern from the design of Alan of Walsingham. It will be seen from the plan (reproduced on the opposite page) how the octagon was worked in to suit the already fixed dimensions. The centre aisles of nave, choir and transepts gave the principal sides, the other four being obtained by throwing arches diagonally across the junctions of nave and transept aisles and choir and transept aisles, omitting the four columns which in any other cathedral would have stood at the points XXXX. It measures 65ft. from east to west, and 70ft. from north to south. The upper part, though intended to have been built in stone, is only of wood.

The Lady Chapel is of great beauty, 100ft. by 46ft., by 60ft. high, big enough for a parish church. The Galilee at the west entrance is also an elaborate piece of work, in two square bays, with good vaulting and rich wall arcading.

Dimensions, 545ft. long over all; nave and aisles, 106ft. wide; choir and aisles, 100ft. wide.

Peterborough.—The cathedral at Peterborough was commenced in 1117, and is principally of the Norman style. Its choir has a semicircular end, though the aisles are not continued round it as was the case abroad. This retro-choir was added between 1438—1528, and is Perpendicular in style, with elaborate fan vaulting. The transepts have only one aisle (on the east).

The noticeable point of Peterborough Cathedral lies in the west front. Erected in 1233, it consists of three great arches nearly 50ft. span, and running the whole height of the building. Each arch is gabled, and the abutments of the end arches are carried up as towers, weighted down by spires. A porch or chapel of late Perpendicular style was added between the central columns about 1500.

Durham.—Durham Cathedral is principally Norman in style, about 1100. Roughly speaking, it consists in plan of a long rectangular nave and choir and three distinct pairs of transepts.

Durham has two principal features:—1st: The Galilee at the west end. This was erected in the very last stage of Norman, almost, if not quite, transitional to Early English. It is rectangular in plan, four square bays east to west by five north to south. The profuse use of the zig-zag ornament is worthy of notice. 2nd: The eastern transept called the Chapel of the Nine Altars. This is Early English of the most "robust" description, erected in 1273.

The massive nature of the interior will be seen to some extent from the plan. (For illustrations see the opposite page.)

6. *Give a short illustrated description of one of the following palaces:—"Farnese," "Riccardi."*

(The wording of this question is a little loose, for there are certainly two, and probably more Palazzi in Italy, erected by the Farnese family. There are actually *two* Palazzi Riccardi in Florence alone, though one is now called "Palazzo Mannelli Riccardi ora Gattai Budini," to distinguish between them. We assume that those referred to are the ones quoted in most text books—Palazzo Farnese, in Rome, and Palazzo Riccardi, in Florence, by Michaelozzi).

The Palazzo Farnese, in Rome, was commenced about 1535 by Antonio di Sangallo. He died in 1546, and Michael Angelo Buonarroti completed it. In plan it consists of a great rectangular block with the usual Italian feature of a spacious "cortile," round which runs on the ground floor an open arcade, carrying the main wall of the apartments above. The principal front is chiefly noticeable for its breadth and simplicity. The ground floor contains only a row of simple windows, with a heavily rusticated, yet still simple doorway in the centre. The first floor, an almost equally simple row of windows, surmounted alternately by straight-sided or segmental pediments, the only ornament being three shields of arms over the central window. The second floor (built by Michael Angelo) another row of simple windows, semi-circular headed, and crowned by straight-sided pediments. Above this a great elaborate and spreading cornice proportioned to the height of the whole building.

This face of the building shows how well breadth and grandeur may be obtained in combination with simplicity. The ornament is almost entirely confined to the cornice which is considered the finest thing of its kind in the world.

The same broad and simple treatment is applied to the wing portions of the garden front, but the centre is broken, and treated quite differently, the ground and second floors having open "loggie" in three arcades, and the first floor having a corresponding wall arcade with half columns and pilasters.

The Palazzo Riccardi at Florence was erected in 1430. It is said that Bramante commenced it, but it is certain that Michælozzo Michælozzi completed it, if he is not responsible for the whole work. It consists in plan of a great unbroken rectangular block. In elevation it is divided into three horizontal compartments. The lowest is heavily rusticated (there was always a possibility of these Palazzi having to be defended against an enemy) with small pedimented windows slightly recessed into non-rusticated spaces, spanned by rusticated semi-circular arches. The first floor is of smooth-faced masonry with sunk joints. The windows of this floor consist of two semi-circular headed lights grouped under a larger semi-circular arch, treated similarly to the walling. The space in the arch-head is filled by a medallion. The second floor is of plain masonry with windows treated very much like those in the floor below. The whole is crowned by a great cornice proportioned to the whole height of the building. (See illustrations on opposite page.)

7. *Give a description of a few of the principal works of either Sir Arthur Blomfield or R. W. Edis.*

(There would be only time to describe about two buildings, three or four others being just mentioned.)

The work of Sir Arthur Blomfield is mostly, if not entirely, Gothic in style, and is accordingly most appropriately chiefly ecclesiastical. He built St. Mary's Church, Portsea, turned St. Saviour's, Southwark, into the cathedral of the diocese of Stepney, built the Church House, Westminster, Sion College on the Embankment, and executed many other works. The Church House, Westminster, is a rectangular hall seven bays in length. Projecting from it on the west is a very fine porch. The style of the building throughout is Perpendicular, amended, if one may so term it, made practical and brought up to suit nineteenth century requirements. The west entrance consists of a broad four-centred arch with contraflex and crocketted hood mould, surmounted by the usual terminal. This is flanked by buttresses whose upper water tables "tumble" in below the parapet which follows the flat curve of the roof. The space thus enclosed is given to a five-light window with elaborate traceried heads following the slope of the roof. Across the bottom of the window is a transom, below which is a series of five empty niches corresponding to the lights above. This porch is flanked by wing walls. Behind this rises the main wall of the hall, with a fine window, which unfortunately is to some extent hidden by the porch. The principal points are, briefly:—The main wall following the steep pitch of the main roof, with large octagonal turrets at the lower angles. In the centre of this gable a seven-light window with four-centred arch, flanked by miniature buttresses much elongated, and carried above the gable slope line, pinnacled and crocketted. The principal mullions of the window are continued up through the arch-mould, with heads foiled and multifoiled. A bold string course is carried across the gable above the apex of the window arch, above which are niches, the centre one having a fine canopy, and containing a figure of Christ; the next niche on either side contains also a figure.

In side elevation, each bay is boldly marked by a buttress carried well up above the parapet, and crowned by, *not* pinnacles, but Elizabethan chimneys. Between the buttresses, on the ground stage, are small single-light windows, with somewhat similar ones above; above these, larger windows in four lights with four-centred heads in square frames, occupying the whole space between buttresses.

The east end is simple and plain.

Sion College.—This is in the same late Perpendicular style. The front to the river consists of:—

To the right, an entrance porch with four-centred arch and canopy of double curve, with crockets and finial. Above this is a pair of two-light windows, separated by a niche with canopy and pinnacles; and above this the gable follows the flat pitch of the roof, with small pinnacles at its lower angles. This porch projection runs a fair way back, the side having on the lower stage a small door flanked by two simple windows, all under a great three-centred arch. The upper stage is divided into panels, alternate ones being pierced as windows.

In the centre is the main portion, with a large five-light window, flanked on one side by an octagonal turret, on the other, by a simple buttress. Below this window is an arcaded band, and below this again a range of windows.

The left wing is treated differently, having on the ground stage a treatment of two two-light windows separated by a single light. Above this is a graceful oriel window.

The works of R. W. Edis are very numerous and varied. From a long list may be selected: The Constitutional Club; much work at Sandringham; Hotel Great Central; Cheveley, near Newmarket, &c.

The Constitutional Club is built upon a triangular site with its principal elevation to Northumberland Avenue. The facing is entirely of terra-cotta—red and white. The front is divided into five bays, of which the second and fourth are slightly projected, the ground, first and second floors of these two being enriched with terra-cotta columns, with the lower parts of each column ornamented with delicate low relief. These two chief bays are treated somewhat differently from each other, one being designed as the entrance, and

ILLUSTRATING ANSWERS TO QUESTIONS 5 AND 6.

the other being slightly curved as a bow window. Each of the five bays is crowned by a gable of double contraflexed curves.

The Hotel Great Central, one of the most recent of Mr. Edis's works, has little in it to show that it is from the same hand as the above. Terra-cotta is used only for the features and enrichments, the main building material being red brick. The main façade is divided into five portions, the centre and two side compartments being projected forward into "pavilions."

The great entrance (in the centre of the main "pavilion") is faced entirely with buff terra-cotta and spanned by a bold arch, flanked on each side by a lesser one, the space above these latter being ornamented with graceful colonnades with windows behind. Above this great arch is a covered balcony, the main wall being carried on three well-proportioned bays of arcading, executed in buff terra-cotta. Above this again the "pavilion" is sub-divided into three vertical portions, the central one being an ordinary bay with splayed sides, dying away at the top of the building into a square clock tower, with circular turrets at each angle. The other two sub-divisions are treated as square bays, breaking (in the top storey) into octagonal form, and crowned by steep-pointed roofs. The end "pavilions" have, on the ground floor, spacious balconies, very much like that described above in the central block. Above these, each block is sub-divided into two vertical portions, each being a bay with splayed sides, dying back, at the roof line, into gables. The two intermediate portions are treated as simply as is consistent with the building.

(To be continued.)

Keystones.

Openings of New Synagogues.—The new Peace and Tranquility Synagogue in Buckle Street, Whitechapel, was consecrated on Tuesday, last week. The new Hambro Synagogue in Union Street, Commercial Road, E., which has cost nearly £4,000, was consecrated on Sunday week by the Chief Rabbi.

A Memorial Window at Holton Church, erected in memory of the late rector, the Rev. R. S. Beloe, was dedicated by the Bishop of Ipswich recently. The work has been carried out by Mr. Kempe, and the window contains three figures of Our Lord, the Virgin Mary and St. Peter, and an inscription to the late rector's memory.

New Bank Premises at Arbroath.—A property of three storeys, consisting of shops and dwelling houses, at the corner of High Street and Hill Street, has been purchased by ex-Bailie Scott at the upset price of £1,100. It is intended to erect on the site of the property new offices for Messrs. Miln and Dalgarno, solicitors, of Arbroath, in conjunction with branch premises for the North of Scotland Bank.

New Board Schools at Ocker Hill.—The ceremony of laying the memorial stone of the new Board Schools at Ocker Hill was performed on Monday, last week. The school will be capable of accommodating 650 scholars. It is being erected by Messrs. Whittaker and Co., of Dudley, from the plans by Mr. Alfred Long, architect to the Board, the style of architecture being Classic, freely treated. There will be a large tar-paved playground and a caretaker's house. The total cost of the undertaking will be between £6,000 and £7,000.

A New Mission Church at Oldbury.—The Bishop of Lichfield dedicated the Church of the Good Shepherd at Church Bridge, in the parish of Langley, last Monday week. The church is a plain but substantial building of brick, the materials having been given chiefly by Messrs. Wood and Ivery, while several other brickmasters gave 5,000 bricks each. It will accommodate 320 persons, and the cost, including the site, is about £2,500. New day and Sunday schools are also being erected in connection with the church.

Bricks and Mortar.

Aphorism for the Week.

"The painter should grind his own colours; the architect work in the mason's yard with his men; the master-manufacturer be himself a more skilful operator than any man in his mills; and the distinction between one man and another be only in experience and skill, and the authority and wealth which these must naturally and justly obtain."—John Ruskin.

The A. A. Programme. We have received a pamphlet from the Architectural Association giving particulars of the curriculum for the session 1899-1900. For the ordinary meetings which are held fortnightly at 9, Conduit Street, a capital list of papers has been arranged. The first meeting, when the President, Mr. G. H. Fellowes Prynne, will deliver his address and the prizes will be distributed, is fixed for October 6th. These large gatherings, however, constitute only a small portion of the Association's work. A number of educational classes are held which afford the architectural student an opportunity for obtaining a thorough mastery of his profession. In connection with these classes a number of prizes are offered. The discussion section—an interesting and useful feature of the Association's work—begins its session on October 13th, with a debate on "The Registration of Architects." On Saturday afternoons in the spring and summer, visits are paid to buildings of architectural interest. We would strongly urge any of our younger architectural readers who are not already members of the Association to write for particulars as to conditions of membership, &c., to the secretary of the Association, at 56, Great Marlborough Street, London, W.

A Roman Camp Discovered. It is reported that excavations on the right bank of the Narenta, in Herzegovina, near Capljina, have resulted in the discovery of an exceedingly well preserved and extensive Roman camp, which archæologists say must have been erected during the reign of Nero (A.D. 54 to 68), and existed till about the time of the Emperor Theodosius, who died A.D. 395; the camp was evidently destroyed by fire, as is proved by the presence of numerous pieces of charcoal and other unmistakable signs of conflagration. As far as can be seen at present, the camp is a hundred mètres long and eighty broad. Most of the walls and arched passages can still be traced. The outer wall has three gates, one of which is two stories high. The steps in the towers are extremely well preserved. The floor and part of the decorations are still in good condition. Many utensils and weapons have been dug up, which afford interesting information concerning the mode of life in the camp.

Old City Conduits. At some time or other most of our readers have seen specimens of the old wooden water conduits, and, perhaps, have thought that at no period was the water supply so pure as when carried to the consumer through these crude appliances. Every now and then workmen come across them while excavating. The workmen who are employed by the National Telephone Company in the work of excavating at the corner of Goswell Road and Old Street, recently discovered some crude cylinders of timber, apparently hollowed-out trees, which had been used for the purpose of conduits. They were found within a few inches of the paving stones. There is nothing to show their exact age; they are in a remarkable state of preservation, and consist of small trunks of elm and hornbeam, tapered at one end in order that they may be easily fitted into another "pipe." They were probably used for supplying London with spring water from the reservoirs at Sadler's Wells, Bagnigge Wells, and adjacent places. The course extends along the gutter way of Old Street. Originally, water was brought into London by these means and carried to public cisterns. Wooden conduits were used before lead ones were introduced, and the records show that in the year 1236, King Henry III. for the "profit of the citie and good of the whole realm . . . granted to the citizens and their successors liberty to convey water from the town of Tybourne by pipes of lead into the City."

St. Mary-le-Bow. A representative of the "City Press" has been interviewing Mr. Churchwarden Thompson on the state of the Church of St. Mary-le-Bow, in Cheapside. Mr. Thompson said that Sir Douglas Fox has fixed "fillets" on the steeple with a view to discovering how far it is out of the perpendicular. Our contemporary quotes some interesting observations, written by Mr. T. Lott, in 1844, on the results of an investigation made by him of several vaults in the vicinity of St. Mary-le-Bow. He says: "Having occasion to inspect several of the houses on the west side of Bow Churchyard, the property of the parish, I am surprised on descending into the cellars to find (as the foundation of three of the houses) stone vaultings of very substantial masonry. On a subsequent visit we found beneath the house No. 5, occupied by Messrs. Groucock, a square vaulted chamber, 12ft. by 7ft. 3in. in height, with a slightly pointed arch of ribbed masonry, similar to some of those of the old London Bridge. We were informed that there had been in the centre of the floor an excavation, which appeared formerly to have been used as a bath, but which was now arched over and converted into a cesspool. Proceeding northwards towards Cheapside we found what appeared to be a continuation of the vault beneath the houses Nos. 4 and 3. The arch of the vault here is plain, not ribbed, and more pointed. The masonry appears, from an aperture made to the warehouse above, to be of considerable thickness. This vault or crypt is 7ft. in height from the floor to the crown of the arch, and is 9ft. in width and 18ft long."

Vaults. The writer continues: "Beneath the house No. 4 is an outer vault. The entrance to both these vaults is by a depressed Tudor arch with plain spandrels, 6ft. high, the thickness of the walls about 4ft. In the thickness of the eastern wall, in the vault of the house No. 3, are cut triangular-headed niches, similar to those in which in ancient ecclesiastical edifices the basins containing the holy water, and sometimes lamps, were placed, instances of which are seen in old Stepney Church, and many other buildings of the same period. In some other parts of these vaults are modern imitations of these recesses. The vaulting beneath the house No. 2 appears to have been destroyed to add convenience to the warehouses, but the buildings, of which these are the vestiges, appear to have extended to Cheapside, for beneath a house in Cheapside, in a direct line with these buildings and close to the street, is a massive stone wall. The arches of this crypt are of the low pointed form which came into use in the sixteenth century. There are no records extant of any monastery having formerly existed upon this spot, and these remains are of a ruder and more massive character than those still existing beneath a house in Leadenhall Street and Gerard's Hall, and those which were discovered in the year 1825, in excavating to form foundations for new houses in Watling Street, all of which are of a far more ornamented and pleasing character than those I am describing, which resemble, more than anything I have seen, a crypt beneath that part of St. Augustine's monastery at Canterbury, which is now a public-house, and to which it forms a wine cellar."

Swarkestone Bridge. The manner in which the preservation of the Gothic arches of Swarkestone Bridge, Derbyshire, has been carried out by the county council will certainly not meet with the approval of lovers of architectural congruity. As Mr. W. Smithard says in a letter to the

"Times" on the subject, the work has been apparently undertaken without any regard for the remarkable character of the structure, as no one having the slightest admiration for Gothic would think of visibly bolstering it up with common blue bricks. If for the sake of cheapness it were unfortunately necessary to use material so incongruous, surely a facing of stone at least should have been provided; but here the blue bricks have been used in such profusion that the new arches look strong enough to carry a railway train, in striking contrast to the original work, which well exemplifies the economy that mediæval builders exercised in material, making up for it in workmanship that has stood the test of nearly 600 years. Two councillors and a surveyor after visiting the spot recommended another scheme whereby the old arches would have remained intact. This was dropped because it was "impracticable," although it would only have involved slightly raising the road. The restoration of a Gothic church is a matter which is not usually left entirely to local architects, but a specialist is employed. A Gothic bridge is in some respects more valuable than a Gothic church, for it is much rarer; therefore, the opinion of an expert should be taken in this case without further delay.

A Roman Pavement at Dorchester. WHILE some workmen were excavating a portion of "Fordington Field," which has been set apart for building purposes, they came across a very fine specimen of a villa pavement. The site of the pavement is about 250yds. in a westerly direction from the ancient Roman amphitheatre which is near to the Roman road leading out of Dorchester to the coast. The pavement was found about 2ft. below the surface, and is about 30ft. long and nearly as wide. The design is unusually elaborate, and consists of red, black, and white tessaræ, forming an octagonal centre, ornamented with guilloches, scrolls, &c., flanked by two oblong designs, each having for its centre a vase of about 2ft. long, of excellent shape, with scroll handles. The fact that the position of the site is about 250yds. south of the union workhouse and just under 150yds. west of the Great Western Railway cutting is remarkable, as very few Roman remains have been found outside the walls of Durnovaria on this side, excepting the amphitheatre.

Dundee Art Galleries. IT was some time ago deemed advisable by the Dundee Town Council to thoroughly renovate the Art Galleries. The improvements have now been carried out. The ceiling of the Great Gallery has been done up in old gold, and the walls have been painted a rich maroon colour. The doors and woodwork of the various galleries have been re-stained and varnished. The entrance hall, staircase and corridors have been decorated in an artistic manner, and have been very much improved by statues which have been placed amongst many flowering plants. As there is no Fine Art Exhibition in the Victoria Galleries at this time, the pictures have been borrowed from collectors, and these line the walls on all sides. A number of artists, both local and at a distance, also readily sent works, among the Dundee artists being Mr. Stewart Carmichæl, Mr. J. G. H. Spindler, and Mr. Charles Phillips; while from Edinburgh the following have kindly sent pictures:—Mr. T. Graham, H.R.S.A., Mr. P. W. Adam, and other local gentlemen. Messrs. Doig, Wilson, and Wheatley, who have been the agents in Edinburgh of the Dundee Fine Art Exhibition ever since its institution thirty-two years ago, have lent nearly one hundred pictures.

Continental Fire Testing Station. THE St. Petersburg Pan-Russian Fire Protection Society, which has been organized on lines similar to those f the British Fire Prevention Committee, has decided to follow the London ociety's example of creating a Fire Testing tation; in fact, its president, Prince Alexander Levoff, has already presented the necessary site and building. The scheme for this station is the result of Mr. E. O. Sachs' visit to St. Petersburg last month, and its organization is part of his project for a series of stations in the continental capitals, to be worked on lines identical with those adopted in London, but whilst the foreign stations will attend solely to matters of local interest, the station at Regent's Park will deal with matters of international importance and serve as the centre. At St. Petersburg, for instance, attention will almost entirely have to be given to improved methods of construction in the villages where safer materials will have to take the place of thatch and matching, &c., a subject which would, of course, be of no moment elsewhere. The annual destruction of villages in Russia, it should be remembered, is very serious, and the national yearly fire loss, according to Mr. Sachs, is about seven millions sterling. Mr. Sachs expects that by a systematic organization of this kind, and a systematic international mode of procedure, with due regard to special local requirements, combined action in fire prevention will be arrived at on the same lines as we have international movements in sanitary and hygienic matters, which, though they have one recognized centre, yet allow independent treatment of purely local questions in the particular countries to which they refer.

Excavations at Melandra Castle, Glossop. FURTHER interesting discoveries are being made in the course of the excavations which are being actively carried out on the site of Melandra Castle, near Glossop. Excavations on the east side have led to the discovery of the old wall, and this has been traced for a considerable distance, and in some places found to be three courses thick. The Porta Principalis Dextera, or right-hand gateway, has likewise been unearthed, and found to be eight yards wide, the intervening roadway being composed of gravel cement. The excavators have also directed attention to other parts of the old Roman station. Various sections have been cut which have brought to light the foundations of a tower and a fireplace or oven. Recently Mr. John Garstang, B.A., of Oxford, who was in charge of the Ribchester excavations, visited the site, accompanied by other gentlemen. An inspection by Mr. Garstang of the work already accomplished led to the opinion that the site would prove to be one of the most interesting ones in the kingdom. Mr. Garstang has been engaged to supervise the excavations.

Albert Hall, Aberdeen. THIS hall, which is considerably used for supper and dance parties, lectures, public meetings, &c., has been very much improved in appearance during the last few weeks. The pitch pine dado round the hall has been revarnished, while the walls, for the first time, have been painted in oils. Above the dado now runs a pale green stencil band, sixteen inches deep, in which an effective floral ornament is brought out in agreeable colours. The surface of the walls has been painted in a rich deep ruby. Under the broad painted frieze is a pendant ornament, sufficient to ease off the colour of the main surface before touching the frieze, which is a conventional floral and figure design in soft and harmonious colours. The woodwork of the ceiling and hall has been re-varnished, and the arch-beams rise from corbels in the side walls, which, themselves treated in cream and gold, form a highly effective embellishment. The ante-rooms connected with the hall have been tastefully re-decorated, and the lobby and staircase have been similarly treated. The decorative work has been carried out by Mr. William Phillips, Huntly Street, Aberdeen.

A New Pavilion for the Sultan. FROM Constantinople comes the intelligence that the park of Yildiz swarms with builders just now. On its Ortakeui side they are pulling down the old boundary wall in order to extend it round adjacent lands lately purchased by the Sultan for annexation to his private domain. On the opposite side they are demolishing the wooden structure hastily run up as a refuge for his Majesty after the earthquakes of 1894. This clearance is preparatory to the erection on the same site of a new pavilion, which is to be the personal and exclusive habitation of the Sultan. Externally it will be an exact reproduction of the Grand Trianon, but its internal fittings will be far more elaborate and its decoration much richer. According to the plans, drawings, and specification, prepared by two French architects and adopted by the Sultan, the cost of the building will be 2,000,000f. A well-known Paris firm of upholsterers has been engaged to design and supply the furniture, which is to be exceptionally *recherché* and proportionately costly.

Sir E. Antrobus's right to Stonehenge. THE feeling throughout the country is strongly in favour of the government acquiring Stonehenge at a reasonable price for the nation. At a meeting of the Wilton Town Council last Wednesday it was decided to petition the government to acquire the ancient monuments, and the council are calling upon the county authorities and antiquarian societies to support the petition. At the meeting several of the councillors questioned whether Sir Edmund Antrobus has the power of selling the ground around Stonehenge, which has been open to the public from time immemorial. There are several roads and footpaths in close proximity to the monument, and the council were unanimous in their opinion that the right of the public to the use of those roads should be maintained. Stonehenge is a source of considerable revenue to Salisbury and district, and the prevailing opinion is that the monument should be acquired by the State.

Improving upon Marconi. IT is reported that encouraging experiments in wireless telegraphy, in which kites were used, have been made between Harvard College and Milton, Massachusetts. The distance was twelve miles, and there were considerable difficulties owing to the electric power-houses, electric trolleys, &c., on the route. In spite of this, however, telegrams passed at the rate of ten words a minute, and it is thought that complete success will be achieved when the disturbing elements have been overcome. The process employed was practically the same as Signor Marconi's, but wires hanging from the kites were substituted for poles. It is claimed that these have an advantage over poles, as being more easily adapted for any height or distance.

"The Most Artistic Country." LAST Monday's "Daily Chronicle" contained the following interesting paragragh:—"We hear so much in England of the superiority of other countries in the methods and results of technical instruction, that we are fairly entitled to any crumb of consolation which may be derived from foreign comments on our own achievements. It is, indeed, something more than a crumb of consolation to be told by competent judges in Vienna that England is now the most artistic country in Europe. It seems that last year the annual exhibition of students' work at South Kensington produced such an impression on one or two Austrian teachers who visited it that official application was made for a loan of some of the drawings and designs, whilst others were purchased at the close of the exhibition. These specimens were exhibited in Vienna, and they extorted the judgment which we have quoted." We should share our contemporary's elation if we had not just the faintest shadow of a suspicion that the "competent judges" in Vienna were merely paying a compliment that was not intended to be taken quite literally. We wonder what our French neighbours would say of this estimate of England as the most artistic country in Europe.

Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor.

ARCHITECTS' LIABILITY FOR DEFECTIVE WORK.

To the Editor of THE BUILDERS' JOURNAL.

BRISTOL.

DEAR SIR,—A small job of cement work—viz., the half round concrete coping of a burial ground boundary wall—was carried out from plan and specification prepared by us and under our superintendence.

We certified for the work in November last, and in the following two months we have had a lot of rain and frost alternately, with the result that the cement coping scaled and chipped. The sand and gravel used with the cement was not of as pure or good a quality as it should have been, and the cement used was Portland cement.

The Sanitary Authority says that we, having given the contractor a certificate for payment on which he was paid, are bound to remedy the defects at our own expense. They have nothing to say to the contractor or the cement manufacturers. Kindly let us know what you think of the matter, and oblige.—Yours faithfully, CEMENT.

I think that the architect is liable to his employers in damages, the measure of which will be the cost of remedying the defect, for having improperly given the certificate.

H. P. B.

HEATING A VINERY.

To the Editor of THE BUILDERS' JOURNAL.

GREAT YARMOUTH.

DEAR SIR,—I want to make a doorway into a vinery, but the hot water pipes, on the flow stand up 12in., and anyone coming through the proposed doorway would have to step over them, which would be very inconvenient. I cannot lower the whole of the pipes on account of the boiler. Would you tell me if I shall get the heat to flow round the house if I insert swan's necks on the flow reducing the flow 12in. for 3ft., the width of the proposed doorway, and raising it again to the same height. Should I get the hot water to run down hill and up again?—Yours, &c.,

F. J. H.

We would suggest that the pipe should be carried over doorway, not necessarily the same size, a 2in. pipe would do, with an air tap on top, and the cistern raised to a point above the air tap, so as to ensure the pipe over the doorway being filled with water. J. AND A.

CLASSES IN QUANTITIES.

To the Editor of THE BUILDERS' JOURNAL.

NEW BROMPTON.

DEAR SIR,—I should feel obliged if you would inform me whether you know of a class being held on Saturday evenings during the coming terms in quantities.

Stationed where I am, I find it rather awkward to get away on any other evening.—Yours faithfully, S. J.

We do not know of any class meeting on Saturday evening; possibly some of our readers can give the required information.

PUTTING PLANS ON PARCHMENT.

To the Editor of THE BUILDERS' JOURNAL.

BRIGHTON.

SIR,—I shall be very glad if you will give me an answer to the following question. I have a number of plans to put on parchment, many of them requiring large washes of colour. I presume that nothing is better than pounce to overcome the *ordinary* difficulties of colouring on the parchment. But it seems necessary to mount the skins, and the preliminary damping of the back has resulted in an immense number of dark greasy-looking spots of various sizes, and these do not dry out. Is the parchment defective, or do these spots generally appear on damping? I do not remember them on previous use of parchment. They practically *cover* most of the surface. I have tried sizing, but with questionable results, and should be glad of advice on the whole operation.—Yours, &c., A. B.P.

Our correspondent's difficulties are in all probability caused by the parchment used, through it not having been properly cured, and being therefore defective, as he suggests. It might, however, be worth his while to repeat the sizing and see if it is more successful. If he has only sized it once, that might be insufficient. We cannot suggest any other remedy. Our correspondent is quite right in using pounce for the purpose he refers to.

H. B. W.

SKELTON CHURCH, YORKSHIRE.

To the Editor of THE BUILDERS' JOURNAL.

MANCHESTER.

SIR,—I wish to make a drawing of the doorway of Skelton Church, Yorkshire, but am unable to go there to measure it. Could you tell me whether it is sufficiently illustrated anywhere? If so, in what book?—Yours, &c.,

ENQUIRER.

Measured drawings of Skelton Church appeared in our issue for April 28th, 1896. Mr. Harold E. Henderson, of 12, Ridge Road, Armley, Leeds, has kindly offered to send "Enquirer" a tracing of the porch which he made in 1897, if our correspondent will communicate with him.

PREVENTION OF VIBRATION.

To the Editor of THE BUILDERS' JOURNAL.

EASTLEIGH.

SIR,—Will you kindly inform me through your valuable journal what I could do to prevent vibration caused by traction engines passing close to my house.—Yours, &c.,

H. H.

H. H. does not give us sufficient data to work upon. It would be necessary for us to know something of the construction and arrangement of his house, before we could definitely assist him. However, we fear he must put up with the vibration, as nothing he could do could materially lessen it. It is obviously impossible to prevent the vibration of the ground communicating itself to the foundations, thence to each floor, and thence to each article of furniture. R. W. C.

BUILDINGS FOR INEBRIATES.

To the Editor of THE BUILDERS' JOURNAL.

LONDON, E.C.

Sir,—Can you kindly refer me to any buildings of recent date which have been erected for the reception of inebriates of both sexes, or inform me where I can obtain any particulars as to the arrangements and planning of such institutions.—Yours, &c.,

ASSISTANT.

We do not know whether "Assistant" requires information about private nursing homes for inebriates or public asylums. We cannot recommend any one book which deals with the whole of this large subject, but would advise "Assistant" to turn up the files of the building papers so as to obtain information about those erected under the Metropolitan Asylums Board. R. W. C.

COLOURS IN WORKING DRAWINGS.

To the Editor of THE BUILDERS' JOURNAL.

IPSWICH.

SIR,—Will you kindly give me an index of colours used in colouring working drawings, representing the various materials used?—Yours, &c. N. A.

The systems employed in colouring working drawings are very varied, but in the following list the first mentioned colour is the most usual for each material.

Brick.—Light red, Venetian red, sometimes crimson lake (to be avoided).

Stone.—In elevation, left white or a light tint of mauve; in section, indigo, sepia, or brown.

Wood. — (Wrot.), brown; (unwrot.), b sienna. Sometimes burnt sienna is for both, or even yellow ochre.

Iron and Steel.—Prussian blue.

Concrete, Asphalte, Cement. — Payne's g neutral tint, &c., interchangeable used to much confusion.

Plaster.—Purple.

Slate.—Sage green.

Tiles.—Bright red (distinguishable from o reds used). R. W.

PARTY WALLS.

To the Editor of THE BUILDERS' JOURNA

LANCASHIRE.

SIR,—Will you kindly inform me what law is in connection with party walls?

Can the adjoining owner cover the f face of a 14in. party wall with his s pilaster to his shop front; or, can we f him to keep it to his side of the *centre* of said party wall?

I was always under the impression each owner was by law compelled to finis mouldings or other features at the ce of a party wall, and not allowed to tres beyond.—Yours, &c.,

MANCHESTER MA

The adjoining owner cannot cover the f face of the party wall with his pilaster.

H. P.

Correspondence.

NOTE BOOKS FOR ARCHITEC

To the Editor of THE BUILDERS' JOURN

WINCHFIELD.

DEAR SIR,—I am sure many will have g reason to thank you for the valuable interesting article, in your issue for Au 23rd, on the subject of note books and dia Having been in the habit of keeping a d and taking notes for many years, it may b some help to others if I draw attention to important matter. It is essential that may be able to find a note quickly. Thi not always easy, especially if the note made some years ago. Hence some simple unfailing system of indexing is of the utr importance. In my own experience I kno no system better than that adopted in " Student's Cabinet Note Books," brought some time ago by Messrs. Eason and Son, 80, Mid Abbey Street, Dublin.

I have no doubt many others besides my can thankfully testify to their usefulnes other ways as well as for note books.—Y faithfully, H. TOWNLEY SUGDE

TO OUR READERS.

THE discussion which has lately taken p in our columns relative to the Registra of Architects has aroused very great inte and has elicited expressions of opinion f many of the most eminent men in the pro sion. We wish to notify to our rea generally, and especially to architects p tising in the provinces, that our columns open to the discussion of other question equal professional interest. Short article open letters on any subjects that are of gen interest to architects and builders will rec careful consideration, and those used wil paid for.

We issue this general invitation to readers with a view to making the BUILD JOURNAL AND ARCHITECTURAL RECORD more widely representative of the interest the architectural profession than it is present. Our aim is to make the journal and more conform to the character of a fessional journal, written by professional for professional men, and to that end we in the co-operation of all who have any sug tions to make that are likely to tend to advancement of the profession.

Keystones.

The Martyrs' Memorial at Smithfield is to be unveiled on Saturday, the 30th inst.; it has just been cleaned and restored.

New Mixed Schools in Branch Road, Hertford, are being erected from plans by Mr. F. Waller, of London, at a cost of over £1,500. Messrs. Boff Bros. are carrying out the contract for the work.

Messrs. Parker's Joinery and Cabinet Co., Ltd., have been compelled, owing to increase of business, to remove to more extensive works and warehouses at 30, Wharf Road, City Road, N.

New Organ for Adlington.—A new organ, built by Messrs. Richardson and Sons, of Manchester, for the Congregational Church at Adlington, near Chorley, was opened last Wednesday evening.

A New Conservative Club at Keighley.—The foundation stones of a new Conservative Club were laid by Mr. Walter Bairstow, of Ripon, and Mr. Thomas Ecroyd, of Keighley, recently. The new premises are to cost about £1,500.

The New Bridge at Boat of Garten was opened by the Dowager Lady Scafield recently. The bridge, which has been erected by Mr. Charles Mackay, contractor, of Inverness, at a cost of £1,500, is of timber, with well-built stone abutments.

Proposed Theatre at Stockport.—The Stockport Watch Committee has refused to grant a full dramatic licence for a new theatre proposed to be erected in St. Peter's Gate at a cost of more than £20,000, and it is understood that the place will not now be proceeded with.

New Dock at Port Talbot.—The new graving dock at Port Talbot, constructed by the Port Talbot Dry Dock and Shipbuilding Company, was opened last week by Mrs. Mordey, of Newport. The dock is 835ft. long, 60ft. entrance and 110ft. wide. Its area is six acres. Alongside the dock are large engineering shops, and it is intended to proceed with the construction of vessels forthwith.

The Smoke Nuisance in Bradford.—At the Bradford City Police Court on Tuesday, last week, before the Stipendiary Magistrate (Mr. Skidmore), Smith Bros. and Eastwood, Valley Road; Ayrton and Co., Shearbridge Street; Thomas L. Lupton, Filey Street; and the Bradford Coffee Tavern Co., Limited, Peel Street, were each fined 10s. and costs for emitting dense smoke from their respective chimneys in such quantities as to cause a nuisance. An order for the abatement of the nuisance was made in each case. The proceedings were taken by Mr. Slater Nicholson, smoke nuisance inspector.

Proposed New Infirmary at Newcastle-on-Tyne.—Mr. J. C. Eno, of Dulwich, who was formerly a chemist and druggist in Newcastle, and has since traded in London, has sent to Mr. Riley Lord, of Newcastle, a cheque for £8,500, the amount required to bring up the Queen's Jubilee Commemoration Fund (which is designed to found a new infirmary) to £100,000. Another sum of £100,000 was bequeathed to the same purpose recently by the late Mr. John Hall, a Newcastle merchant, on condition that the jubilee fund should be raised to the same sum and collected within three years.

Barnsley Police Accommodation.—Col. A. G. Durnford held a Local Government Board inquiry on Tuesday last week, into an application of the Town Council for permission to borrow £1,752 for the erection of police buildings and a court house. By gutting the lower storey of the present town hall premises and the police quarters adjoining, it is proposed to provide charge-room, clerks' offices, and parade-room of ample dimensions, and to provide four cells, fitted in the latest approved manner. It was stated incidentally that the Council would shortly come forward with a scheme for treatment of the sewage of the town bacteriologically.

The Birmingham Royal Society of Artists opened its seventy-third annual exhibition to the public on Monday.

The Decoration of the "Oceanic."—The decoration of the principal apartments and staircase of the White Star liner "Oceanic" was entrusted to Mr. R. Norman Shaw, R.A.

The Royal Duchess Theatre at Balham, of which Mr. W. G. R. Sprague is the architect, is nearly completed, and it is estimated that its cost will be about £35,000.

The Annual Exhibition of the Sheffield Society of Artists was opened on Friday. The collection of pictures is smaller this year than last, being only 176 as against 330.

The Walker Art Gallery, Liverpool.—The autumn exhibition was opened on Monday. One of the most prominent pictures is Sir Edward Burne-Jones' "Arthur in Avalon."

Proposed Hospital at East Ham.—Mr. Passmore Edwards has offered to give the sum of £4,000 for the erection of a hospital at the corner of Shrewsbury Road, East Ham.

New Schools at Burtonwood, Lancs., have been erected at a cost of about £2,000. Mr. Thomas Beesley, of Warrington, is the architect and Mr. James Pilkington, of Ramford, is the builder.

A Stained-Glass Window at St. Peter's Church, Newbold, was dedicated recently. The window is by Messrs. Comere and J. Capponnier, of Brussels, and illustrates the subject of "The Widow's Mite."

Subsidence in the City.—On Friday, the roadway in Cannon Street, close to St. Paul's Cathedral, to the extent of twelve yards, suddenly gave in from the centre, causing the remainder for some distance around to warp and buckle up.

Fire at a Paris Electric Works.—A serious fire broke out on Wednesday evening in some large electrical works at La Chapelle Triage, by which La Chapelle and St. Denis railway stations are supplied. Damage was done to the extent of 100,000 francs.

A New Baptist Chapel at Maesteg, Glamorganshire, was recently opened. It is built of local stone, with Forest of Dean dressings. The roofing is of copper-coloured Carnarvon slates. The cost was about £1,400. Mr. W. W. Williams, of Blaengarw, is the architect and Mr. D. J. Davies, of Swansea, is the contractor

The Highest Monument in the World is the statue of the Virgin—the Madonna of the Snow, as it is called—which is on the very top of Rocciamelone. It is cast in bronze, and weighs about 1,500lbs. It was cast in eight pieces, and there being no road on the mountain, but only paths and gullies formed by running water, the different parts were carried by forty Alpine soldiers and twenty sappers.

Accident at a Foundry.—A mishap occurred on Wednesday afternoon at the Scotch Foundry, Manchester, belonging to Messrs. Fletcher, Russell and Co., by which thirteen men and boys employed there were burned by molten metal. The tube connecting the cupola and the receiver had got clogged, and while the obstruction was being removed the persons injured had gathered round, in spite of warnings of the danger, to watch the process. They received on their heads and the upper parts of their bodies the spurts and jets of melted pig-iron. Most of the sufferers, after being taken to a hospital, were able to go home, but three were detained as in-patients.

A Hospital at the Nile Dam Works at Assouan has been erected by Messrs. Aird and Co., for the treatment of any of the workmen engaged on the great undertaking who may meet with an accident or be stricken by disease. Messrs. Aird and Co. report that 198 patients have been treated since October, 1898, when the hospital was opened. The buildings seem to have been admirably planned, and there are distributed about the works eight hospital stations in convenient positions. The cost of the hospital buildings and the dwelling-houses connected therewith has been approximately £4,300, and the annual charges, including the expenditure on the sanitary department, amounts to nearly £3,500.

New Infantry Barracks at Pembroke Dock are to be erected at a cost of £90,000.

Closure of Roads.—The Constitution Hill and the roads in St. James's Park, with the exception of the road from Storey's Gate to Buckingham Palace Gate, will be closed for repairs for about a month.

A Carved Oak Altar and Retable has been placed in the chancel of the parish church of Pagham, Sussex, and the sanctuary floor has been raised. The altar was designed by Mr. G. P. Allen, architect, of London, and was built by Mr. Foster, of Bedford.

Extension of Preston Police Station.—The plans of the extensions to the police-court were passed on Wednesday by the Town Council, and application is to be made to the Local Government Board for sanction to borrow £7,000 for carrying out the work.

Proposed Improvement of Scarborough Harbour.—The Scarborough Harbour Commissioners have decided to carry out a scheme for the widening and extension of the West Pier at a cost of £10,000, and the committee have been authorised to obtain the necessary loan and tenders for the work.

A Stained Glass Window has been erected in St. Clement's Church, Greenheys, Manchester, in memory of Mr. Jackson, who was for many years a warden. The artists of the window which has for its subject, "The Good Samaritan," are Messrs Wailes and Strang, of Newcastle-on-Tyne.

A New Wesleyan Chapel at Portbury is to be erected at a cost of about £300. A number of memorial bricks were laid on Wednesday. The new building is to be of plain red brick and will measure about 31ft. by 20ft. with a vestry. It will seat about eighty persons. The plans were by Mr. J. Young, of Bristol.

A Tower has been added to Walton Church, of which Messrs. Brown and Burgess, of Ipswich, are the architects, and Mr. H. J. Linzell, of Ipswich and Felixstowe, is the builder. The tower is Perpendicular in style, and is faced with split Bramford flints, with Portland stone dressings. It is built upon the foundations of a former church, and inside there is a circular staircase leading to the belfry. The new porch is paved with York stone and tile.

Fall of a Crane at Cement Works.—As a crane was being employed to lower cement and bring up slates, on Thursday, at the cement works of Messrs. Bright and Sons the arm snapped off at its base, and the crane, with cement bags and slates, fell on the van, horses, and men below. One of the horses was killed instantly, and three men—William Prettyman, John Jevons, and Manuel Willox—were so severely injured as to necessitate their removal to a neighbouring surgery, where they were treated.

Newcastle Improvements.—At a meeting of the Newcastle Town Improvement Committee, the report for the widening of Byker Bridge was adopted, and it is to be presented to the Council for approval. The road for vehicular traffic will be 40ft. wide, and there will be a footway on each side 10ft. wide. It was decided to proceed with the paving of Percy Street, from Blacket Street to St. Thomas's Street. Plans were submitted for a proposed block of buildings at the top of New Bridge Street, but as they did not meet the requirements of the committee, they were not passed.

Rolling Stock Contracts.—It has been announced in Birmingham that large contracts for rolling stock for the Indian State Railways have just been placed with the Birmingham and Midland Waggon Companies, and that corresponding orders for iron and steel have been divided between South Staffordshire, South Yorkshire, and Scotland. About 5,000 tons of iron alone have been ordered from Staffordshire firms. The representative of one of the leading British railways states that his company is immediately tendering for 10,000 tons of materials for rolling stock equipment, and that the heavy English lines are preparing for an exceptionally large winter traffic.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work. An asterisk (* signifies accepted

BIDDULPH.—For the execution of water supply works, for the Urban District Council. Mr. C. R. Hall, engineer, 1, West-street, Congleton. Quantities by the engineer:—

W. Lawton	£3,651	2	7	J. and S. Beech	£3,265	0	0
Williams and Co.	3,622	5	8	C. J. Nevitt, Stafford*	3,132	10	0
F. Barke	3,276	0	0	H. Shardlow	3,077	2	0
W. Lovatt	3,275	0	0				
C. W. Machin	3,298	0	0				

[Engineer's estimate, £3,221 18s. 5d.]

BRIDLINGTON QUAY.—For the erection of three double-fronted houses, Horsforth-avenue, for Mr. F. Lowson. Mr. J. Earnshaw, architect, Carlton House, Bridlington Quay:—

E. Corner	£1,882	10	0	E. Wilson	£1,695	12	0
Blackman and Son	1,856	0	0	Smallwood and Shaw	1,680	11	6
T. Weldon	1,806	16	3	E. E. Yeomans	1,505	0	0
T. Spink	1,798	0	0	W. Barnes	1,500	0	0
T. Atkin	1,784	10	0	T. Blackburn	1,495	0	0
A. Gardam	1,711	0	0	J. Rennard*	1,195	10	0

[All of Bridlington Quay].

BRUTON.—For erecting girls' school, Mr. A. J. Pictor, architect, Bruton:—

S. Dodimead	£3,735	0	0	Clarke & Sons	£3,210	0	0
Long and Sons	3,638	0	0	J. & L. Francis	3,200	0	0
H. W. Pollard	3,460	0	0	T. Hobbs, Bruton*	3,041	3	4
Merrick & Sons	3,250	0	0				
T. Lydford	3,219	0	0				

BURNTISLAND (N.B.)—Accepted for the erection of school buildings for the School Board. Mr. Robert Little, architect, 4, St. Brycedale-avenue, Kirkcaldy:—

Masonry.—J. Jackson and Son, Burntisland	£2,525	16	6
Joinery.—D. Simpson, Kirkcaldy	1,299	11	4
Plumbing.—A. Rolland and Son, Dumfermline	283	14	6
Slating.—J. Storrier, Newport, Fife	120	0	0
Plastering.—W. Anderson, Burntisland	165	2	0
Ironwork.—Gibson and Son, West Fountainbridge, Edinburgh	153	16	0
Heating.—Meikle and Philp, Torphichen-street, Edinburgh	225	0	0
Painting.—A. Dick, Burntisland	52	13	5

CARDIFF.—For the erection of new warehouse in Millicent-street, for Mr. John Isaac. Mr. Edgar G. C. Down, A.R.I.B.A., 31, High-street, Cardiff, architect. Quantities by architect:—

Williams & Hoare	£1,925	0	0	R. Haines	£1,810	0	0
J. Perkins	1,923	18	0	D. Thomas & Son	1,795	0	0
Blacker Bros.	1,888	0	0	Geo. Griffiths	1,764	17	0
Lattey and Co.	1,861	0	0	S. Shepton & Son*	1,734	10	0
W. Thomas & Co.	1,855	7	0	Rees and Thomas	1.679	0	0
Fred Cousins	1,848	19	10				

[All of Cardiff.]

CREWKERNE.—For the erection of a factory at Crewkerne, for Mr. J. H. Walter. Mr. Henry Hall, architect, 19, Doughty-street, W.C.:—

Quibell	£2,083	0	0	Lye and Sons, Crewkerne*	£1,773	17	6
Watts	2,078	0	0				
Munford	1,895	10	6				

EXETER.—For new shop front, and alterations to 197, High-street, Exeter, for Mr. J. Tulsford. Mr. R. M. Challice, architect:—

THE SANITARY INSTITUTE.

CONGRESS AND HEALTH EXHIBITION.

[BY OUR SPECIAL CORRESPONDENT.]

THE eighteenth annual congress of the Sanitary Institute was opened on Tuesday, August 29th, at Southampton, under the presidency of Sir William H. Preece, K.C.B., F.R.S., President Inst.C.E., and if numbers be any criterion, must be considered one of the most successful yet held. It is estimated that from 1,800 to 2,000 attended from all parts of the United Kingdom, delegates representing Government Departments, County Councils, County Boroughs, Metropolitan sanitary authorities, Urban District Councils, Rural District Councils, Port Sanitary Authorities, School Boards, and a number of Medical, Scientific, Engineering, Architectural, and Building Societies, &c.

Everything that the Mayor and Corporation of Southampton, assisted by a powerful local committee, could do for the comfort and welfare of the visitors was done, and the only discordant note heard was from several delegates *re* the extortionate charges one of the hotels in the High Street tried to levy on visitors. It appears that the ordinary charge for bed and breakfast at this presumably respectable hostelry is but 6s. 6d., yet the landlord had the assurance to demand one guinea per night for a bed during the Congress week, and his other charges were in keeping. It is only fair to say that the Mayor and several members of the Corporation expressed their disgust and disapproval of the practice. It is actions such as these that are liable to give a bad impression to visitors, and to cause loss of custom to a town. The South-Western Hotel seemed to be patronised the most, and where everyone was loud in praise of the comfort and attention received, and the reasonableness of the tariff.

The Mayor formally welcomed the members and delegates to the Congress at a reception, which was largely attended, held in the large hall of the Hartley College. In the afternoon Sir William Preece, K.C.B., F.R S., gave his presidential address. He opened by saying that since their last congress they had lost one of their shining lights in Sir Douglas Galton, who was connected with the Institute from its commencement, and took a very active part in every branch of its work. The principal object of modern sanitary science was to discover the race and peculiarities of bacteria, and the chief function of the sanitary engineer was to defend the human frame from its invisible and insidious external foes. Protection from disease was the art of defence. They must know their enemy, detect his presence, defeat his movements, and destroy him as he would destroy them.

The Greatest Sanitary Engineer

the world had ever known was Moses. The Book of Leviticus was a treatise on hygiene. For 3400 years the world stood still, and only one race followed the doctrines and teachings of that great master. The Christian threw his tenets to the wind—the Mohammedan, to his great benefit, had continued to practise some of his principles to the present day. The Jew remained faithful, and was the healthiest and longest-lived type of humanity. The doctrines of Moses could be summed up in the objects of sanitation to-day, namely, pure air, pure water, pure food, pure soil, pure dwellings, and pure bodies. While research and discovery were abroad, whilst the practice and science of sanitation were in a state of transition, while bacteria were regarded by some as a passing phase of fashion, and by others as a great discovery come to stay, it was clear that they could not yet have reached finality. There were three very important principles underlying all the practical applications of sanitary engineering: (1) energy, or the ability to do work; (2) chemistry, or the power to transfigure matter; (3) life. The supply of pure air to those who breathed it was the object of ventilation, and the problem was to promote thorough circulation without imparting the feeling of draught, and without affecting the temperature or the humidity of the air. Thus the whole theory of ventilation was circulation of air maintained at a proper temperature, for cold air might be injurious. The British Legislature had taken care that lunatic asylums, hospitals, workhouses, and gaols should be well provided with proper air space per person, and should be supplied with effective means for ventilation; but churches, chapels, theatres, meeting halls, assembly rooms, railway carriages, &c., were totally neglected, and remained sinks of discomfort. People had a horror of draughts, windows were mercilessly kept closed. The minimum cubical space in feet for hospitals was 1000 and for factories 250. In a dining-room where he recently dined with four gas burners alight, by taking each gas burner as equivalent to five persons, the cubic space was 160 feet per head, and this air remained stagnant for two hours, and hence his head became an aching mass. In a third-class railway carriage, when full, it was only forty-seven cubic feet per passenger.

Electricity

had fortunately come in to simplify their difficulties. It had the great merit that in the glow lamp it did not vitiate the air. It supplied them also with a convenient form of energy to promote circulation either by forcing in the outer air, or by drawing out the foul air. It could even warm the air, and it could sift it from all material impurities before admission. Where the energy was cheap, it could be used not only for lighting, but for all mechanical purposes, and if it were properly utilised the span of life should certainly be extended beyond David's allotted period. The next necessity was pure water. Getting good water and maintaining it was the chief work of the sanitary engineer. But the maintenance of good water was the function of the authorities. Regular and active inspection must be maintained, and cheap and nasty fittings must be eschewed. Sir Edward Frankland found in Thames water one hundred thousand bacteria per cubic centimètre, and good drinking water should not contain more than twenty bacteria per cubic centimètre. Pollution had not yet been made a penal offence, and the Rivers Pollution Act of 1876 was inefficient to prevent pollution, and was in many places practically obsolete. He thought carefully purified

Water

was misused when applied to such purpose as the laying of dust, generating of steam, and flushing public sewers—processes which led to re pollution without any benefit whatever. To get a duplicate supply was well worth the consideration of the London County Council, for it would more than double the Metropolitan supply for domestic use. The Thames Valley ought to supply London with excellent water for the next fifty years, even with its present works. Five thousand tumblers of London water contained only one grain of solid matter, and the death-rate in the Metropolis, a good practical standard of the purity of the water, was well below the average. Valuable aid was rendered by electricity in securing the auxiliary supply of water, and impure water was completely sterilised by ozone, and ozone was easily, though not very cheaply, produced by electricity. The enormous importation of food into this country, rendered it imperative that strict and rigid inspection should be exercised upon its condition. The most important and the most general form of

Food

supplied was milk. The danger from milk was infinitely greater than from meat. It was unfortunately a great medium for the transmission of the germs of disease, especially of the bacillus of typhoid fever and of tuberculosis. Unclean milk was too common, and, unfortunately, inspection and examination of cows, cowsheds, dairies, and milk cans was in many cases thoroughly inefficient. It was not at present under the control of the proper sanitary authorities. Legislation as affecting adulteration of food, the importation of meat, and the sale of drugs, fruit, and fish was probably ample. It was the enforcement of regulations, the control of supervising powers, the appointment of inspectors that was weak; and that was to be remedied more by the publication of the proceedings of that Institute than by pressure from the central Government Departments, which too frequently was resented rather than encouraged. The big towns could and did take care of themselves, but the little towns and the scattered districts wanted educating and nursing. The system of treating and disposing of sewage could be considered under the three heads of mechanical, chemical, and biological. A distinction must be drawn between the requirements of great towns, villages, and hamlets and isolated houses. Every case must be dealt with on its own merits, as there was no one process equally applicable for every kind of sewage. Land treatment, either by itself or after the solids had been removed, formed, by the requirements of the Local Government Board, an essential feature of every scheme for

The Disposal of the Sewage

of an inland town. Unfortunately, as a rule, sewage farms did not pay, and it would be a great relief to get rid of them. It was impossible to recommend too highly the care with which the very able body of engineering inspectors attached to the Board examined schemes of sewage treatment and disposal, but there was unfortunately, a growing habit among local authorities to make material alterations in schemes after they had been sanctioned by the Board. That destroyed confidence, and in the end acted prejudicially on all concerned, and especially upon those eminent consulting engineers who were generally responsible for the work, and whose difficulties were very largely increased by local interference. Electricity had not played an unimportant part in assisting the sanitary engineer in his attacks upon sewage, though attempts had been made to assist the oxygenation of water by electrolysis. In regard to the sanitation of dwellings, people suffered not alone from ignorance, but from carelessness and filth. The lower the social scale and the greater the weakness of education, the more callous and indifferent human beings became to cleanliness and comfort and improvidence. The curse of drink, crime and vice were to be ameliorated only by education and by example. The legislation of recent years, by which local authorities could improve the dwellings of the working classes, and inspect and control common lodging houses, had exercised a beneficial influence upon the community, but, unfortunately, these authorities were much hampered by the restrictions of the Act of 1890, empowering them to improve the dwellings of the working classes, and they were checked by the greed of vested interests. The responsibility of

Maintaining Pure Dwellings

rested now very much with the sanitary authorities. The medical officer of health was a power. The examination of sanitary inspectors in London, thanks to the action of the Institute, was now compulsory under the Public Health (London) Act, 1891. It was not so in the provinces, but local authorities were becoming alive to its necessity, and they were requiring the possession of this certificate as one of the qualifications for appointment. The effects of rigid inspection and thorough application of the powers of legislation were shown by the fact that the death-rate in Surrey was 14, while in North Wales it was 20 per 1,000. 3,000 souls per annum ought not to die in North Wales if sanitary matters were duly looked after! Legislation, though often half-hearted, tended very much to increase the responsibilities of the local authorities. They were encouraged to acquire and conduct certain trading operations which affect the interests of the whole community, especially the supply of water, of gas, of electrical energy, and of tramways. But, while in most places they did not go far enough, in others they went too far, and by undertaking the manufacture and supply of fittings, they trod upon the corns of their own ratepayers and stirred up the enmity of local private interests.

The Electric Light

was the greatest boon, and it was essentially the poor man's light. Tramways, by withdrawing the working classes from the interior of the towns to the more open and purer air of the suburbs, solved the question of improved dwellings, and by working these railways by electrical energy, they so reduced the cost of generation of the energy that the supply of electric light could be made the most economical source of artificial illumination. Glasgow had very strangely separated the tramway house from the electric light central station, and had thus deprived its light customers of a reduction of at least one penny per Board of Trade unit. Manchester and Liverpool were wiser in their generation. Hygiene was the most important knowledge for everyone to possess, though it was, perhaps, the least acquired. That Institute had recognised the desirability of encouraging the

Teaching of Hygiene in Schools,

and it had arranged a thorough theoretical and practical examination for teachers which matured next year. "Cleanliness is next to Godliness." That was the keystone of hygiene. It promoted cheerfulness, and, after all, cheerfulness was the greatest doctor they had. An important feature of the introduction of electric light into our homes was cleanliness. It neither vitiated the air nor deposited dirt. Reports were occasionally circulated in the Press that it affected the eyes, but he had never come across a single case, and his experience in that direction was very extensive. The chief function of the Sanitary Institute was not only to dispense knowledge, but to disperse ignorance. The resistance to progress was not so much ignorance itself, but the determination to remain ignorant. The

Work Done by the Institute

was of national importance. It removed public apathy, and exerted enthusiasm in good work, in new discoveries, and in imparting knowledge to those who were willing to receive it. They must never forget that every true step in advance taken by Science brought the engineer to a point from which there was no retrocession, but from which further advance was possible.

In the evening the Health Exhibition was opened by the Mayor, when there was a most encouraging attendance. Dr. Louis Parkes gave a short address, in the course of which he mentioned that the Institute had now held seventeen congresses and exhibitions, and this was one of the very best of the exhibitions—certainly it was in the first rank. This could be seen in the large number of awards already made, and no medals were given, he added, without careful tests. In the manufacture of sanitary appliances, he went on to say, England was still ahead of every other country.

Sir Henry Littlejohn proposed a vote of thanks to the Mayor for having opened the exhibition, and also for the great interest which he had shown in the visit of the Institute. Alderman Tilling seconded the vote, which was carried with acclamation.

On Wednesday, Thursday, and Friday the various sections met, when many instructive and useful papers were read and discussed. As we are unable in this issue to spare the space that necessarily these papers demand, it is our intention for the next two or three weeks to publish *in extenso* some of the papers that we think will prove most interesting to our readers.

In the afternoons of these days the local committee had arranged excursions to and inspections of various places of interest, such as the Electrical Works, the Isolation Hospital, the Sewage Works, the Waterworks, Hospital Ships, all of which were largely patronised, while pleasure parties were found in Lady Creighton's garden party, the "at home" given by Surgeon-General Nash and officers at Netley Hospital, water trips to the Isle of Wight, an excellent "at home" given by the directors of the Union Line on board the s.s. "Scot," a drive through the New Forest, and lastly, by kind permission of Her Gracious Majesty, a visit to Osborne House and grounds. The Mayor's reception on Wednesday evening, given in the Pier Pavilion, was largely attended, over 1,000 people passing before his Worship and the Mayoress. The Congress will meet at Nottingham next year.

THE EXHIBITION.

This occupies the whole of the Skating Rink and Victoria Rooms as well as a large temporary building connecting the two halls. The general arrangements are good. There are, in all, some 125 stands, though we missed some firms of note, such as Messrs. Twyford, Ltd., Messrs. Jas. Woodward, of Swadlincote, Messrs. Wragge, Bermantofts, and others. We heard a complaint last year at Birmingham and again here at Southampton that may possibly account for the absence of some of these firms. One or two leading sanitary ware manufacturers said it seemed both unfair and absurd that gold and silver medals should go to cocoas, cornflours, meat extracts and patent medicines, while the *bona fide* sanitary exhibitors who took large stands, spent much money, time and labour, in perfecting inventions, such as closets, urinals, sinks, gullies, pipes, junctions of various kinds, and such like—should be only rewarded by bronze ones. To our mind this is a most legitimate complaint and one worthy of the attention of the Council before next year.

One of the cleanest and brightest exhibits in sanitary ware in the hall was that of Messrs. Geo. Howson and Sons, Limited. That our opinion was correct is proved by the fact that this firm received no less than four bronze medals. Among their specialities was "The Westwood Improved Household Combination sink," made in various sizes, fitted with patent receiver for drying board. Another interesting article was their "Patent lavatory basin with syphonic overflow"—a prevention for overflowing taps and also accumulation of soap suds or refuse generally.

Messrs. Duckett and Son, Burnley, had a large and varied exhibit. Here we saw a range of five isolated syphonic closets in amber and white. These were automatically flushed from an overhead cistern; the effect being a double syphonic action, the first in the cistern and the second at the outlet. The second syphonic action is stopped automatically before the flushing tank has discharged its contents, thus providing an after flush to recharge the basins with clean water. Another closet worthy of note was their "Clincher Closet," a clean water wash-down closet, which obtained a bronze medal at Leeds in 1897, and again here at Southampton. The flush is divided by an oblique channel in the ware, and meets again opposite the outlet, where the joined force of water is equalised by the introduction of a small partition.

Messrs. W. Glover and Sons, Ltd., Warwick, obtained a silver medal for their "Tipping Dust Van." This van took the premium offered by the London County Council. There were 325 competitors, and the Liverpool Corporation have since purchased the van. This dust van is fitted with a patent wind guard, a sliding cover, and a simple lever for the tipping apparatus. The advantages claimed are simplicity and durability, lightness of draught, easy tipping, lowness for filling. This should prove a great boon to many councils.

Messrs. Henry Rossell and Co., Ltd., Sheffield, had a boiler front on view fitted with their patent automatic smoke preventer. The apparatus consists of a series of panels which are opened and shut by the action of a cataract cylinder. This furnace door is peculiarly adaptable to places where steam boilers and furnaces are largely used. The process is simple and automatic. Our contemporary *The Engineer*, writing on this subject of smoke abatement a few weeks ago, commended Rossell's Automatic Furnace Door very highly, and said that it was a great improvement on the late Mr. Prideaux's invention.

[Our notice of many important exhibits is held over till next week.]

By THOS. G. DEE, A.S.I.

(*Concluded from p. xxviii., No. CCXXXVIII.*)

As coal rich in hydrogen forms a larger proportion of hydrocarbons than are formed from that poorer in hydrogen, and these are distilled off first, they require that the air to combine with those volatile gases shall enter the chamber above the coal, and in varying quantity and intermittently, thus differing from the necessary admission of air through the incandescent carbonised coal on the firebars at a later stage in the combustion.

Before, however, referring to the history of boiler furnace invention, I desire to point out that the regulation of air inlet and outlet to boiler power is largely a question of the height and area of the chimney. A formula for the calculation of the area necessary at the top of the chimney may be advantageously brought in here; it is as follows:—

$$\frac{\text{Lbs. of coal used per hour per H.P.} \times 12 \times \text{H.P.}}{\sqrt{\text{height of chimney.}}} = \left\{ \begin{array}{l} \text{in square inches the} \\ \text{area of the top of} \\ \text{the chimney.} \end{array} \right.$$

If we assume that 10lb. of coal are used per hour for each horse power, then for a 30 h.p. boiler with a round chimney 81ft. high an area of 400 square inches is required, *i.e.*, a diameter of 23in. The following is an application of the above formula to this case:—

$$\frac{10 \times 12 \times 30}{\sqrt{81}} = \frac{3600}{9} = 400 \text{ sq. in. area} = 23\text{in. diameter.}$$

In furnace construction many methods to accomplish the perfect combustion of coal have been invented both to avoid the variations due to the different ability of stokers, and also, if possible, to burn a refuse coal. One of the earliest recorded patents for boiler furnaces is that of Dr. Papin, in 1695, and a great many specifications are set out in the various patents granted late in last century and in the first half of the present century, which include nearly all the special points claimed for modern furnaces.

As it is necessary to admit air in larger proportions on the surface of the fire when coal is put on, so that the first gases as they are freely disengaged may be fully oxidised, automatically closing doors are good.

When a furnace is fed through an open door, great care should be used to properly apply the damper, or a rush of cold air is admitted, thus preventing the attainment of the proper temperature in the mixed gases for combustion, hence automatic stokers which prevent opening doors and spread coal evenly are good, as are also those arrangements whereby the air is heated previous to its distribution in the furnace.

Again, the disengagement of the first gases at a modified rate tends to prevent imperfect combustion, hence cooking furnaces are very good.

The nature of the gases present in the chimney of a furnace and their relative proportions are the proper tests of the efficacy of a furnace, whether we consider it from the public health point of view, with respect to the substances added to the atmosphere, or from the water evaporating power, and the difference of these two aims is small, but unfortunately vital, because a furnace with a slightly smoky chimney is rather more effective as a steam producer than a perfectly clear one (Proc. Inst. Civ. Eng., 1892-3).

The gases leaving the chimney should, in round numbers, be as follows, or approximate thereto:—

Carbon Monoxide, none.	Carbon Dioxide 10%
Sulphuretted Hydrogen, none.	Oxygen ... 8%
Sulphur Dioxide, variable.	Nitrogen ... 82%

As possessing in one apparatus almost all the features which have been aimed at in the many patents in the list of furnaces and furnace appliances that have been taken out, the Murphy Automatic Smokeless Boiler Furnace is, in my opinion, the most perfect modern form. This furnace is very largely used in America, and can be seen in daily use at Lincoln Works,

---

* A paper read before the Annual Provincial Conference of the Sanitary Inspectors Association at Lincoln on August 4th.

Chesterfield, under the control of the sole licensees for the United Kingdom, Messrs. Clench and Co., Ltd. The furnace is fed automatically and to magazines at the sides of the fire.

The green fuel is placed there on coking plates, and the gases of distillation are distributed at that part of the furnace where they can most readily be brought into contact with the air which is entering in divided streams, and has been heated by convection in passing through, and by radiation from the fire-brick arch.

The inclination of the two sets of bars towards each other, together with the rocking movement of the bars, tends to maintain a very even fire, whilst the rotation of the clinker breaker keeps the fire clean, so that the carbonised fuel is always maintained in an incandescent state.

The last phase of this question is that which practically concerns us, that is to say, the law and its application.

You all are fully acquainted with the wording of the sections under which we act, and know the danger which we have to face in the pitfall of the definition "consume or burn the smoke as far as practicable, having regard to the nature of the manufacture or trade," and whilst a knowledge of the theory of combustion will be of great use to us in cases we are compelled to take under those provisions of the Acts, I wish to point out those exemptions are with respect to smoke of any colour except black. If we therefore confine ourselves in all cases of the emission of black smoke to the general provision of "any chimney (not being the chimney of a private dwelling-house) sending forth black smoke in such quantity as to be a nuisance," I am of opinion that our difficulties will be minimised. For (first) the owners cannot put up the servant as the proper defendant (Barnes v. Akroyd, L.R. 7, Q.B. 474). Nor is it any defence to prove that as far as practicable the furnace does consume the smoke arising from the combustible used therein (Weekes v. King, 53 L.T., N.S. 51). Neither is it necessary to prove that the smoke is injurious to health (Gaskell v. Bayley, 80 L.T. (N.S.), 516).

Much, therefore, depends upon the facts of our observations, and as to those the individual inspector must be the responsible person, and whilst avoiding fear on the one hand and rashness on the other, he must steadily proceed to fulfil his duty, being true to himself and thereby false to no man.

The principal fact to be determined is what is black smoke, and in arriving at this I beg of you not to be led to give the slightest consideration to diagrams in which *black* lines of varying thicknesses and distances apart are drawn upon pieces of white cardboard and viewed from a given distance. Such a method of mixing up the result of *black* lines and white cardboard to produce a general grey effect does not alter the colour of the *black* line. Neither is the fact that the smoke is black altered because of its different density when viewed against the sky, it giving an apparent variation of the colour due to the effect of the relative amount of these two factors.

Certainly, if a very small amount of black smoke is being sent forth from a chimney, it is for the inspector to determine if, in his opinion, that quantity is a nuisance, and to report it or not, as he decides whether, or not, in his judgment the law has been infringed.

Doubtless what is or is not a nuisance must be partially determined by the character of the neighbourhood in which the chimney is situated. For example, in such a residential neighbourhood as Westminster, where I am engaged, with its blocks of high-class flats rearing lofty heads to heights of 80ft., 90ft., and even 110ft. above the street level, black smoke, even in small quantities, from the electric light works, lift and heating works, hotels, restaurants, &c., which abound in their immediate neighbourhood, cannot escape being a nuisance, while a much larger amount of smoke in the midst of factories surrounded by the houses of the people who earn their daily bread within them will doubtless for the present be tolerated, whilst our work of educating steam producers on this question is proceeded with.

I think that such guides as an allowance of two and a half minutes' dense black smoke, or ten minutes' black smoke of medium density in thirty minutes, which are given in some towns as standards, the infringement of which the Local Authorities will bring before the justices, are a somewhat unwise invitation to furnace-owners to aim low and thus prevent the attainment of that possibility, a smokeless chimney.

It is advisable to remember that at the last International Congress of Hygiene and Demography, held in England, W. S. Thiselton Dyer, Esq., F.R.S., Director of Kew Gardens, permitted the result of an analysis of the solid deposit from the atmosphere, found on plant houses in London, to be published. Of this deposit it was found that thirty-nine per cent. was carbon. I do not, of course, forget that the greater part of that carbon came from the chimneys of private dwelling houses, to which at present our duties do not extend.

In conclusion, then, let us determine in this, as in other phases of our multifarious duties, to so labour, that as far as it lies in our power the public shall have an unpolluted atmosphere; the conscientious furnace user shall receive the full advantage of our knowledge and experience to aid him in determining the most suitable method to be adopted to his special need in the prevention of the emission of black smoke; the persistent offender shall be reported again and again, the unsympathetic magistrate who fines but rarely and then lightly shall be wearied into well doing; and a grateful public shall in effect say to us that as we have been faithful in these matters they will trust us with stronger powers by giving us such a tenure of office that the author of a text-book on sanitary inspectors' duties may eliminate that portion of his work which infers or states that because the manufacturer and the smoke producer have influence on every Town Council the inspectors must in this matter proceed with caution.

Masters and Men.

Glasgow Corporation Labourers' Wages Advanced.—The Statute Labour Sub-Committee have agreed to recommend that the following advances of wages be made:—Masons' labourers engaged at the sewers, from 23s. 9d. to 25s. a week during the summer, with an extra holiday; ordinary labourers, from 21s. to 22s. a week, with an extra holiday; causeway beaters, 1s. a week; and settmakers, ½d. an hour.

The Yorkshire Building Dispute.—At a meeting of the Leeds Master Builders' Association, on Tuesday, last week, the result of the voting on the proposal to grant an advance of a halfpenny an hour to the London Order of Bricklayers was announced. Eighty-seven papers had been sent in, seventy-nine votes being registered against the granting of an increase, the remaining eight being in favour of it. The result of the voting will be communicated to the Yorkshire Federation at a future meeting.

Inverurie Stonecutters on Strike.—Some trouble has arisen between the Inverurie Branch of the Masons' and Stonecutters' Union and the firm of Messrs. Paul and Ritchie, stonecutters there, owing to the firm declining to sign the operative by-laws. On Wednesday, as a consequence of the dispute, the Union operatives of the firm quitted work. A meeting of the Inverurie branch was held the same evening, at which it was decided to put the yard down as a non-union job. It was reported that the operatives who had left work had all found jobs elsewhere.

The Bricklayers' Labourers' Strike at Leicester has now been on for over twenty weeks. The cause of the dispute is the men's demand for an advance of ½d. per hour. Six members of the Employers' Federation and thirty-six non-federated employers are paying the increase, but 400 men are still in receipt of strike pay, which has been raised from 10s. to 12s. a week.

Plasterers' Dispute in Manchester.—A meeting of employers in the allied building trades was held on Tuesday, last week, in Manchester, under the presidency of Mr. C. W. Green, of Liverpool, when a distinct advance was made towards a settlement of the dispute in the local plastering trade, which has lasted for twenty-seven weeks. When the national dispute was settled, in June, the Manchester employés declined to go to work again except at an advance in wages of a penny per hour. The employers offered a halfpenny advance forthwith, and another at the end of twelve months; but this the men would not accept, and a deadlock ensued. At this meeting, however, the men wrote offering to take the second advance at the expiration of six months. On this basis the employers decided to meet the men in conference on Thursday. At the meeting on Thursday a settlement was arrived at, the terms being that the plasterers should resume work on September 11 at an advance of ½d. per hour, with the promise of a further increase of ½d. in six months.

Builders' Notes.

A Gainsborough Painter in Difficulties.—The creditors of James Noble, painter and decorator, of Gainsborough, met at the office of the Official Receiver, Lincoln. The debtor's statement showed gross liabilities £1,337 19s. 3d., of which, however, only £205 19s. 3d. is expected to rank for dividend. The estimated assets are £80 10s, leaving the deficiency £125 9s. 3d. No resolutions were passed.

New Brick Works at Blyth.—New brick works, on an extensive scale, have been commenced at Blyth by the Albion Brick Company, Limited, to work what is believed to be a valuable royalty of clay on the outskirts of Blyth, near the Cowpen Colliery. The royalty comprises twenty acres, leased from the Thornton and Croft trustees, and the seam of clay, which is 20ft. thick, and of good quality, lies only a few inches from the surface. The works are equipped to produce a daily output of about 20,000 bricks.

Chorley Builders' Affairs.—The first meeting of creditors in the estate of Thomas Homer, senior, 227, Eaves Lane, and Thomas Homer, junior, residing at 2, Kershaw Street, Chorley, lately carrying on business in copartnership as builders under the style of Thomas Homer and Son, at Eaves Lane, Chorley, was held on Tuesday last week at the offices of the Official Receiver, Wood Street, Bolton.—The Official Receiver's statement set forth that the bankrupts, who are father and son, were journeymen bricklayers up to June, 1896, when they entered into partnership as builders, though they had only £8 of capital between them. They commenced erecting houses, obtaining advances as the buildings progressed. Eventually they got pressed by creditors for the materials they had obtained for the construction of the properties, and filed a petition in bankruptcy. The gross liabities were put down as £3,763 15s. 6d., of which £3,403 was due to fully secured creditors. The estimated value of securities was put down at £3,630, and after making all allowances there was an estimated surplus of assets amounting to £140 7s. 8d. The debtors attributed their failure to "speculative building." Both father and son attended the meeting, and were closely questioned by creditors and by the acting Official Receiver. — Ultimately the matter was left in the hands of the Official Receiver.

The House for Sisters of Mercy at Dungarvan is being warmed and ventilated by means of Shorland's patent Manchester Grates.

East Pentire Estate, Newquay, Cornwall.—The sale of the first portion of this estate was held by Messrs. Protheroe and Morris, of 67 and 68, Cheapside, London, on the 26th August. The estate has quite recently been acquired by the West Newquay Syndicate, Limited, whose registered offices are 20, Budge Row, Cannon Street, London, E.C. The plan of the estate was prepared by Mr. John Ennor, junr., of Newquay, and the solicitors were Messrs. Vincent and Vincent, of 20, Budge Row, Cannon Street, London, with whom were associated Messrs. Collins and Sons, of St. Columb and Newquay. The prices realized for the various plots were as follows: Esplanade Road, lot 8, £200; lot 7, £175; lot 6, £130; lot 5, £125; lot 4, £120; lot 1, £130. Pentire Avenue, lot 28, £75. Pentire Crescent, lots 72 to 80, £40 each, the buyer of lots 72 to 76 also taking lot 71 at the same figure. Gannel Crescent, lots 81 to 88, and 91, £50 each; lot 89, £54; lot 90, £52. Pentire Crescent, lots 92 to 94, £115 each; lots 95 and 96, £110 each; lot 97, £105. At the request of some purchasers lot 9 was offered at the close of the sale, and knocked down at £175. There were also offers made for lots 10 to 14, but the biddings were not high enough. The lots were, however, sold privately, subsequent to the sale; as was also lot 98. The total amount realized was £3,606. The lots unsold were 2 and 3, 24 to 27, and 32 to 36; and we hear that offers have been made for some of these already.

Sunderland Docks Improvement.—The River Wear Commissioners have resolved to invite tenders for the construction of most extensive works for the enlargement of the docks. About eight and a half acres are to be added to Hudson Dock North, and coal shipping places are to be erected which will allow of the very largest vessel taking in cargo. A new timber storage ground is also to be provided, and increased facilities afforded on the river front, where a great many old houses are being demolished.

Electric Lighting at St. Helens.—Col. W. R. Hacke held a Local Government Board inquiry on Tuesday, last week, into the application by the Corporation for permission to borrow £3,600 for electric lighting extensions. Mr. Highfield, the borough electrical engineer, gave details of the scheme, and said that it would not be necessary to take up all the cables from the streets where they were already laid. They would take out only the light tension feeders. The plant for the new districts would be capable of supplying 3,500 lamps of eight candle power. The Corporation had demands for 1,200 lamps.

Surveying and Sanitary Notes.

Street Improvements at Crewe.—Colonel Slacke, R.E., held an inquiry on Thursday at Crewe into an application by the Town Council to borrow £5,459 for works of street improvement and sewerage.

Septic Drainage at Elgin.—At a meeting of the Town Council on Monday, last week, the borough surveyor submitted a report in which he estimated the cost of the septic system of drainage for the town at £7,200, and £85 per annum for management.

Disposal of Sewage at Ashton.—Colonel W. R. Slack, R.E., Local Government Board inspector, held an inquiry at the Council Offices, Bryn Street, Ashton, on Wednesday morning, with respect to the application of the Ashton Urban District Council to the Local Government Board for sanction to borrow the sum of £3,693 for sewerage and sewage disposal purposes.

Public Works at Eccles.—Colonel A. G. Durnford, R.E., inspector to the Local Government Board, opened at inquiry at the Town Hall, Eccles, on Thursday, into an application of the Town Council for power to borrow £12,200 for works of main road improvements, £1,793 for additional expenses incurred in extending and furnishing the new municipal buildings, £1,556 for works of private street improvement, and £550 for purposes of sewage disposal.

Public Improvements at Ulverston.—The Ulverston Urban Council desire permission to borrow £19,000 for the purpose of street improvements, being the purchase and rebuilding of Bryers' Smithy to allow of widening Prince Street at that point; £2,750 for purchase of the premises now occupied by the Bank of Liverpool in Queen Street, to be made into Council Offices, and £1,000 for improvements and additions to the Gas Works. Col. W. R. Slack, R.E., a Local Government Board inspector, held an inquiry recently into the application.

Sewage Disposal Problem at Bradford.—The disposal of sludge which remains after the treatment of sewage at the Fuzinghall Works was on Tuesday week the subject of a conference between the Sewage Defœcation Committee and the Sanitary Committee of the City Council. It has been found more expensive to treat the sludge at the destructor works of the Sanitary Committee than ordinary refuse, so it was decided at the meeting to send the sludge to be burned at the Cliff Road destructor for two months, and to prepare a return for the actual cost.

Engineering Notes.

New Light Railway for Cornwall.—The Board of Trade has confirmed the order for the construction of a light railway which will join the Great Western Railway at Marazion, near Penzance, and extend to Land's End.

Electric Current Centenary.—Coincident with the Congress of Electricians at Como, on September 18th, to celebrate the centenary of Volta's electrical researches, it has been arranged for Dr. J. A. Fleming, Professor of Electrical Engineering, University College, London, to deliver on the same day a lecture before the British Association, at Dover, on the subject of "The Centenary of the Electric Current." The lecture will deal with the question of wireless telegraphy, and will be illustrated by experiments.

Proposed Electric Lighting Extensions at Sunderland.—At the Town Hall on Tuesday, last week, Mr. R. H. Bicknell, M.I.C.E., conducted an inquiry on behalf of the Local Government Board into an application made by the Corporation for power to borrow £40,000 for the purposes of electric lighting. The Town Clerk (Mr. F. M. Bowey) stated that recently the Corporation obtained a Bill empowering them to lay down electric tramways, and they were making the present application in order to provide electric power for the trams, and also to enable them to extend their mains for the ordinary supply of light. The Commissioner complained of the absence of full drawings of the various projects, and stated that the application would not be granted until these were furnished. It was stated that the net profit on the working of the electric station last year was £352.

Proposed Improvements at Tay Ferries.—At a meeting of the Tay Ferries Committee of Dundee Harbour Trust, on Monday, last week, Mr. Robert Taylor submitted a sketch plan of an improvement on the pier and landing-places, which it is considered would do much to remove existing defects, and to ensure the more efficient conduct of the service. The proposal provides for the construction of a pontoon pier, extending 150ft. into the river. By this means a minimum depth of six feet of water would be obtainable at the lowest state of the tide. It is futher contemplated, once this plan has been carried out, to fill in the existing Craig Harbour, and to carry the Esplanade across the ground. The filling-in would place at the disposal of the Board fully an acre of valuable ground, which at £2 10s. a pole, would be worth about £400, and at 27½ years' purchase would represent a sum of between £11,000 and £12,000. Were the scheme carried out in its entirety, it would save the expense at present incurred for dredging the harbour, repairs to piles, &c., which amounted to about £600 per annum.

Property and Land Sales.

FREEHOLD BUILDING ESTATE, fronting on main road and close to golf links and Highgate Woods, seven minutes' walk from Muswell Hill and East Finchley stations. To be LET on lease or SOLD in plots. Liberal advances to responsible builders if required. For plans and particulars, apply to Mr. GEORGE H. PAINE, Architect and Surveyor, 6, Stoke Newington-road, N. 7

An acre of singularly valuable Freehold land, 270 yards from the Stock Exchange and opposite the north end of Throgmorton-avenue, Throgmorton-street, City, to be let upon 80 years' building lease direct from the Corporation, with a fully-licensed house thereon.

MESSRS. REYNOLDS and EASON are instructed by the Bridge House Estate Committee of the Corporation of the City of London to LET by PUBLIC AUCTION, at the Mart, Tokenhouse-yard, in OCTOBER, 1899, the above singularly valuable SITE of 44,038 square feet, with extensive frontages on Blomfield-street, London Wall, and Finsbury-circus.

Particulars, plans, and conditions of letting may be had, when ready, either of the City Comptroller, or the City Surveyor, Guildhall, E.C.; at the Mart, Tokenhouse-yard; and of the AUCTIONEERS, 43, Bishopsgate-street Without, E.C.

SALE DAYS for the Year 1899.
Messrs.

FAREBROTHER, ELLIS, EGERTON, BREACH, GALSWORTHY, and CO. beg to announce that the undermentioned dates have been fixed for their AUCTIONS of FREEHOLD, Copyhold, and Leasehold ESTATES, Reversions, Shares, Life Interests, &c., at the AUCTION MART, Tokenhouse-yard, E.C.

Other appointments for intermediate Sales will also be arranged.

Thursday, Sept. 21
Thursday, Oct. 12
Thursday, Oct. 26
Thursday, Nov. 16
Thursday, Nov. 23
Thursday, Dec. 7
Thursday, Dec. 14

Messrs. FAREBROTHER, ELLIS, and CO. publish in the advertisement columns of "The Times," "Standard," and "Morning Post," every Saturday a list of their forthcoming Sales by Auction. They also issue on the first of every month a schedule of properties to be let or sold, comprising landed and residential estates, farms, freehold and leasehold houses, City offices and warehouses, ground-rents, and investments generally, which will be forwarded free of charge on application.—No. 29, Fleet-street, Temple Bar, and 18, Old Broad-street, E.C.

Seaside and other Land Sales.

MR. F. G. WHEATLEY is instructed to offer for SALE by AUCTION plots of exceedingly ripe FREEHOLD BUILDING LAND (tithe free and land tax redeemed), on the following ESTATES

SEPTEMBER 13TH, 1899.

WIMBLEDON.—Raynes Park Estate.—Within 10 minutes of Raynes Park Station, with its excellent train service, 20 minutes from Waterloo. 77 plots of ripe Freehold Building Land, suitable for villas and small houses. Good road. Water laid on. Golf links adjoin estate.

SEPTEMBER 28TH, 1899.

CHURCH STRETTON, Shropshire, known as the Highlands of England, 13 miles from Shrewsbury, famous for its bracing air and medicinal properties of its mineral waters. Excellent golf links. Good hunting and shooting. About 80 plots, commanding fine views of the Stretton Hills. Return tickets for London buyers, including bed and meals, on 27th and 28th, price 10s., but early application is necessary.

Luncheon is always provided at the place of sale.

Payments by instalments extending over a term of years, if desired, and free conveyances.

Particulars, plans, and railway tickets may be obtained on application to the Auctioneer, Mr. F. G. WHEATLEY, 263, Strand (next the Law Courts), W.C.

ANSELL and MALLOWS, Architectural Draughtsmen and Quantity Surveyors, 21, Buckingham-street, Strand, W.C.

R.I.B.A. EXAMS. PREPARATION, personally or by correspondence, in three, six, nine, or twelve months' courses. Architectural Lending Library. Special three months' finishing courses. — For full particulars apply to Messrs. HOWGATE and BOND, Associates R.I.B.A., Perchard House, 70, Gower-street, W.C. (close to the British Museum.

ARCHITECTURAL Institute, Society of Architects, and Civil Service Technical Examinations. Preparation by correspondence, personally, or in residence. Seventeen first places.—MIDDLETON and CARDEN, 19, Craven-st., W.C. 1

PLANS, Applications, &c., Prepared by an experienced Architect. Advice given in Building Act questions, and disputes settled. — Address, Architect," 17, Algarve Road, Earlsfield, S.W. 3

FOR SALE in the MIDLANDS, Builder and Contractor's BUSINESS and PREMISES, including a first-class and nearly new Steam Joinery Plant, with extensive Shop, Stables, and Residence, nearly new, and specially built for the business. Last ten years' annual income from £600 to £700. Will clear for £1,800.

Reason for selling, going out of business. The above in a healthy country district. — Apply Box 1165, "BUILDERS' JOURNAL" Office. 5

THE SANITARY INSTITUTE.
LECTURES AND DEMONSTRATIONS FOR SANITARY OFFICERS, MEAT INSPECTORS, AND OTHERS.

The Twenty-eighth Course of LECTURES will be held at the Parke's Museum, Margaret-street, W., on MONDAYS, WEDNESDAYS, and FRIDAYS, commencing SEPTEMBER 15th.

The course includes, in addition to the Lectures, a number of Practical Demonstrations and Inspections at places illustrative of sanitary practice and administration.

Full particulars can be obtained at the Offices of the Institute, Margaret-street, W. 1

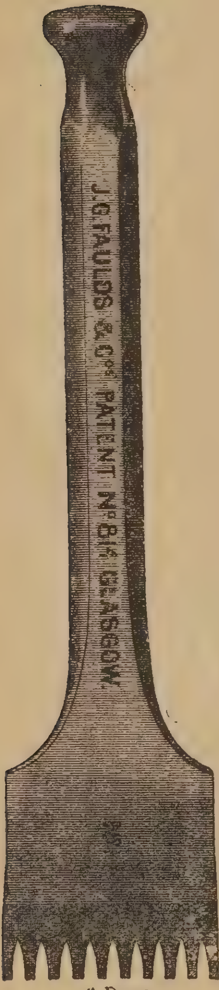
TO MASTER BUILDERS, CONTRACTORS, AND ALL ENGAGED IN STONE-CUTTING.

J. G. FAULDS'

IMPROVED

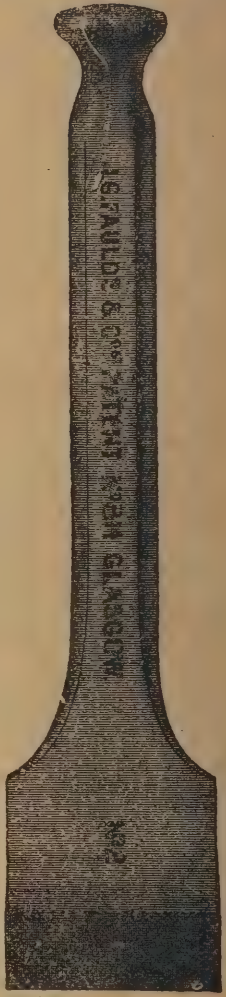
Multiplex Stone-Cutter.

Any person manufacturing these Tools will be liable to prosecution for infringement of Patent.



J.G.FAULDS &C^os PATENT Nº814 GLASGOW.

2" Drove, showing Cutter in Slot.



J.G.FAULDS & C^os PATENT Nº814 GLASGOW.
Nº2

Reversible Cutter, with "Drove" Edge out.

These IMPROVED TOOLS for stone-dressing combine lightness with great efficiency in working, with perfect freedom from the annoyance of bad sharpening, tempering, or other defects. They possess *double* the advantages of the AMERICAN TOOTHED TOOL, by having, in a handy and convenient form, double teeth, or a chisel and "tooling drove" combined, the efficiency and economy of which a PRACTICAL MAN WILL SETTLE IN A FEW MINUTES.

The outstanding merits of the MULTIPLEX STONE-CUTTER are its simplicity and economy. They are simple in construction. The Handles are made with a slot (see below) in which the Cutter is inserted, and the Tool is complete. There are no screws or joints in the Handle to give trouble in fixing or removing the Cutter. They are economical. By the use of these Tools a great saving is effected, all the loss of time, trouble, and expense incurred in getting the ordinary tools sharpened being avoided.

Owing to the handiness and durability of these Tools they are in constant use throughout the whole of the United Kingdom.

Two sample Tools, with six Cutters, sent carriage free to any address in the Kingdom on receipt of a Postal Order for 2s. to the

SOLE INVENTORS, PATENTEES, AND MANUFACTURERS—

An Architectural Causerie.

The Regeneration of Bloomsbury. BLOOMSBURY is in the course of a Renaissance. Neglected for the last forty years or more, from a time, that is to say, when the market-gardens of Brompton began to be built upon and South Kensington to be called into existence, it is now enjoying a new period of appreciation. Wanderers into the outer suburbs—the professional men who gasped for air and modified rusticity, and lived for awhile beyond the circle of the smoke—have returned, disillusioned. They made their exodus in such numbers that they, in effect, took the town with them and set up settlements among the cows and the buttercups. You may see some of those outlying settlements to-day, over the Surrey hills and on the borders of Kent, in a very derelict condition indeed. There is Bellagio, the once much-advertised colony of bungalows, seated among the hills and the woodlands, and half deserted, like a played-out Californian mining-town, waiting for some new Stevenson to weave a story round it, whose colonists have returned to what Cobbett was never tired of calling "The Wen," the forgiving, much-abused, all-absorbing London. The wealthier and the busier residents of the nearer suburbs, too, have set their faces again Londonwards; and where within the wide range of the Metropolis should the professional man of standing reside but in Bloomsbury? South Kensington he has tried, and found wanting, but the neighbourhood of Russell and Bedford Squares has the advantage of being "central." Life for the busy man is now cut up into something very like a Chinese puzzle. He has to fit in all sorts of irreconcilable things, and to economise the half-hours and oddments of time; and, indeed, it looks not unlike the old era coming back, when the trader lived above his shop, and the architect under the same roof with his office. How shall one whose time is valuable economise it under the circumstances of congested traffic and unpunctual trains to and from the different points of office and residence?

There is spaciousness in Bloomsbury, too; great roomy houses, built when all else westward was a wide expanse of fields, and when the way across to Hampstead and Highgate lay by brooks and meadows, with never an intervening house save some infrequent farmstead. To-day it is possible to glimpse those northern heights from the upper windows of the Bloomsbury squares, but only across an intervening sea of houses. Elbow-room is costly now, but when those squares were planned, a good deal over a hundred years ago, space was not so exigent. Therefore, the entrance-halls of those houses are not uncommonly as large as the rooms in most modern dwellings, with every other detail in order. The gardens of those squares, too, have had a century and more to develop, and contain trees of a magnificent growth, and lawns whose emerald beauty can only be reached by a long period of constant care. Bloomsbury, in its almost fifty years of neglect, has developed slums, it is true, but during the last six or seven years many of them have been put in order, and others swept away for the building of flats. There are huge blocks of flats here now, and at one time it seemed as though the whole district was going that way. But a pause has come in that fashion, and with the refitting and resanitation which many of the old houses have undergone, there is no reason why the renaissance of Bloomsbury, which has recently been so marked, should not be permanent. There was a time when the neighbouring Doughty Street was the foremost journalistic centre in London. Edmund Yates lived there for years, and so for a longer period did George Augustus Sala; and many journals, some defunct long since, and others still flourishing, have been projected in the prim houses of that thoroughfare, or in the neighbouring Mecklenburgh Square, hard by the Foundling Hospital.

C. G. H.

Ightham Moat, Kent. IGHTHAM Moat House, the most perfect and picturesque example of a "moated grange" in the south of England, is a building well worth a visit. Situated a few miles beyond Sevenoaks, it is within easy distance of London. The Moat House stands about two miles south of Ightham village. It is built of stone, and forms a quadrangle. The building is surrounded by a moat which washes the outer walls. The main entrance is by a bridge and gateway giving access to the courtyard. The house is of three distinct periods: Edward the Third; then Henry the Seventh and the beginning of Henry the Eighth; the third, Elizabeth and James the First. The hall, one of the most interesting features of the house, is spanned by a central stone arch with a principal rafter on each side; the mouldings on the stone arch and on the principals are of the decorated period. There is an opening in the roof which was made as an outlet for the smoke when a stone hearth was used in the centre of the hall. The present fireplace is of the Elizabethan period as is also the large window in the hall, the other windows being decorated. The chapel is not so old as the hall, being built about 200 years later. At the east end of the chapel is a small apartment giving access to the main building. The original painted ceiling remains, emblazoned with the badges of Henry the Eighth, Katherine of Aragon, and former owners of the Moat House. The house came into the possession of the Selbys of Northumberland in 1592, and remained in the Selby family until 1888. Our illustration is from the pen of Mr. Frederick Adcock.

Builders' Weights and Measures.

If ever the Metric system of weights and measures comes into general use in England, few classes of people will have greater reason to welcome the change than that which is engaged in building operations. At the present time confusion reigns supreme. Not only is the system of calculating superficial and cubic dimensions—the duodecimal system—different from that adopted by any other class of the community, but units vary to an amazing extent in different parts of the country, and even in the same district when different materials are considered. Brickwork in walls, for instance, is, in the London district, measured by the "rod" or "perch," of 272 square feet, being reduced to a uniform thickness of 1½ bricks; but in some parts of the country it is measured by the square yard, the thickness being stated, and when in bulk, as in railway bridge abutments, is almost always measured by the cubic yard. On the other hand, slating is measured by the "square" of 100 square feet, while a "thousand" of slates means twelve hundred, a thousand bricks being only a thousand nett, and a "thousand" nails being but nine hundred; and the various market sizes of slates are given fancy names, such as "Rags," "Queens," "Duchesses," "Countesses," and "Ladies." Wall paper, again, is measured according to a standard of its own, the unit being the "piece" of nominally 12yds. long (actually rarely more than eleven) and 21in. wide where English papers are concerned, though a "piece" of French paper is only 7yds. long and 18in. wide. Then, whilst most metals are reckoned according to their weight, zinc is measured according to its thickness to the Birmingham wire gauge. Glass is treated analogously, for while sheet glass is known by its weight per foot super, plate glass is known by its thickness in fractions of an inch. Baltic timber, when imported, is sold by the St. Petersburg "standard," which is cubically equivalent to 120 deals, each 12ft. long, 11in. wide, and 1½in. thick; but when used in buildings the cubic foot is the unit most commonly adopted for carpentry work, though custom varies much in different places. A "load" of timber, too, contains only 40 cubic feet of rough and 50 cubic feet of hewn. After all, however, it is in materials connected with plastering that confusion is most rampant; hair, for instance, being measured by the pound, laths by the bundle, cement by the bushel, cement mortar by the hod of half a bushel, lime and sand by the cubic yard, and mixed plaster by the sack. More than that, each of these measures varies with local custom. In the north-eastern counties hair is sold by the vague "bag," and in other parts laths by the "load" and by the thousand feet run, while a "bushel" of cement is smaller than the standard bushel, a cubic yard containing twenty-three instead of twenty-two. As for lime, the methods of its measurements are infinite, the "chaldron" being a somewhat favourite unit, presumably because nobody knows exactly what it means, some authorities saying that it contains 32, others 36, and others 48 bushels; but "quarters," "hundreds," "sacks," and even "hogsheads" or "cider casks" are all recognised measures for lime in different localities. The need for reform is urgent, but it cannot be looked for until some generally recognised and inter-related system of weights and measures, such as the metric system, is introduced compulsorily; for the majority of those engaged in the building trades are ultra-conservative in their customs, not being highly educated men like the analytical chemists, who were able to voluntarily effect the change to the metric system when once they recognised its advisability.

G. A. T. M.

On Reflection.

Clerk of Works and Workmen.

The duties of a clerk of works, or of an architect who acts as his own clerk of works, are often of a difficult and delicate character, but if all builders' labourers conducted themselves after the pattern of one John Thompson, whose case was lately disposed of at the Uttoxeter Petty Sessions, these duties would be fraught with more danger to life and limb than the leading of a cavalry charge. Mr. R. W. G. Hayward, architect, of Nottingham, who has been superintending the work of enlarging a school at Abbotsholme, appears to have a standard of workmanship that does not coincide with that of John Thompson. He was unreasonable enough to insist that the work under his charge should be properly done. For this offence he was assailed with abusive and threatening language, and was even waylaid by the redoubtable Thompson, knocked down and severely kicked. The sentence of two months' hard labour passed by the bench disposed satisfactorily of the principal actor in the brutal business; but if the statements made in court that the prisoner was merely the tool of the foreman are true, the latter ought not to be allowed to escape scott free. The state of things at these works would appear to be about as bad as it is possible to imagine. Two of the other workmen who witnessed the assault are stated to have made not the slightest effort to prevent it. The clerk of works seems to have been regarded as the common enemy, though for no other reason—as far as we can learn from the report that reaches us—than that he sought to do his duty and see that the work under his supervision was efficiently carried out. The case suggests the enquiry whether some sort of disciplinary action on the part of the trades unions to which, presumably, the men belonged, would not be possible and desirable. The unions are very keen to resent—and rightly so—any injustice done to their own members. It is time that some attention were directed by trade union leaders to the problem of how to impress workmen with some sense of responsibility towards their employers. We do not believe—although the charge is often made—that in a general way the unions encourage shirking and bad workmanship, but it would have a salutory effect if such conduct as that of these workmen at Abbotsholme were distinctly reprobated by their fellow members and branded with something of the ignominy which attaches to the "blackleg."

London's New Street: A Suggestion.

The new Strand-to-Holborn thoroughfare, about which so much has been heard, naturally affords a first class opportunity for all who have any special ideas as to the way in which a city should be built or a road made. There has been no lack of suggestions; and that is as it should be, for an improvement of this magnitude is a very rare event in London, and it behoves anyone who has a luminous idea on the subject to make it known before the time for discussion has gone by. As might be expected, some of the ideas that have found expression are more brilliant than feasible. One suggestion, however, which strikes us as being eminently practical and reasonable is made by "The Thermostat" (a monthly journal devoted chiefly to questions of fire prevention and extinction). Our contemporary suggests that underneath the road there should be one great central conduit running along its whole length big enough to take all cables, pipes, and mains, and deep enough for the men to work in. Each house or block of houses might have an outlet by which it could be fed with gas, electricity, or water, and there could be man-holes to admit workmen. The adoption of such an arrangement would obviate those exasperating blocks, which we know so well, whenever a portion of the street is "up." Any additional initial expense which such a method of construction might involve would soon be more than repaid in the saving effected by the cessation of the constant taking up of the road surface whenever a gas pipe has to be repaired or a leak found in a water main.

The Trade Union Congress.

There are various opinions as to the importance and influence of the Trade Union Congress, which has been meeting during the past few days at Plymouth. While it is unjust and foolish to regard the recorded resolutions of the elected representatives of upwards of a million workmen as the vapourings of windy and irresponsible agitators, it is perhaps scarcely more reasonable to give to them the dignity of a programme of reform on which the workers of the country are likely to unite to bring to a successful issue. Many of the resolutions were mere pious opinions which have no driving force behind them, and to the realising of which probably few of the delegates would be willing to devote a single hour's hard work. That is a criticism, however, which does not apply to the discussion on the important question of the Housing of the Working Classes. On this subject the delegates displayed a striking earnestness and a striking unanimity. The problem is one which presses heavily upon the workers, not in London only, but in all parts of the country. Mr. Ben Tillett's resolution on the subject was carried unanimously; it was to the effect that municipalities should avail themselves of the powers vested in them under Part 3 of the Housing of the Working Classes Act; that a rent court should be established on the lines of the land courts in Ireland and Scotland; and that improved services of workmen's trains should be established to enable workmen to live at greater distances from their work. Strongly as we object to the forcing up of rents which has been going on lately in the East-End of London, and to a less extent in other localities, we are more than doubtful of the practicability of fair rent courts; but with the other proposals we heartily agree, and we are glad to see that the workers are beginning to grapple seriously with a problem which is of such vital importance to the well-being of the community. It is somewhat remarkable that one solution of the problem—the transportation of manufactories and the workers employed in them to country districts where houses might be built and let at reasonable rentals, does not seem to have found an advocate. Mr. Howard's scheme of "Garden Cities," to which we recently referred, or the less ambitious and actually realised project of such model villages as Port Sunlight, suggests to our mind the lines along which a solution of the problem may most hopefully be sought.

Back Numbers of the Builders' Journal Wanted.—The publisher would be much obliged if readers who may have by them any copies of Nos. 105, 106, 107, and 108, dated February 10th, 17th, 24th, and March 3rd, 1897, of the BUILDERS' JOURNAL AND ARCHITECTURAL RECORD, which they are able to spare, would kindly send them to him, as these are required for office purposes. A copy of the current number of *The Architectural Review* will be sent as an acknowledgment of the courtesy.

WITH GREEK BUILDERS.

By JOHN A. MARSHALL.

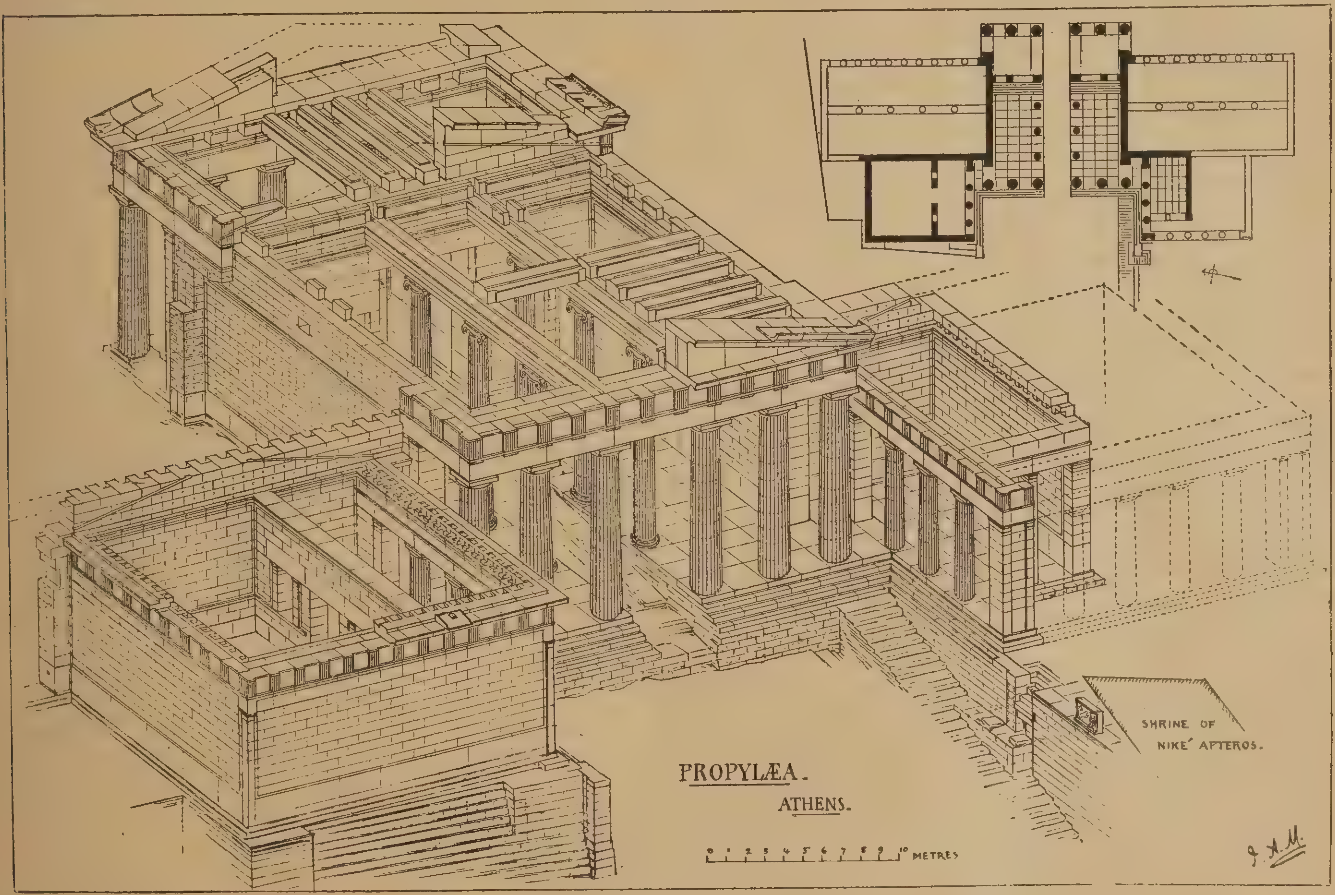
(Continued from page 55, No. CCXXXVIII.)

III.—THE PROPYLÆA.

> *"Thou dost hover o'er thy grave all glowing, genius!"*—Goethe.

To follow, in fancy, the steep ascent, and pass through the gateway of the Acropolis at Athens, is the delight of all students interested in the world's noblest architecture.

For the present, we will linger at the portal; and certainly no better example could be selected to serve as a basis for our further enquiry into the structural details of Grecian architecture.



PROPYLÆA. ATHENS.

It will scarcely be necessary to explain that the idea of this building is an elaboration of the simple Propylæa of prehistoric times, as exemplified at Tiryns and Hissarlik, whereby the enclosure was approached through two vestibules, one outside the gateway and the other inside, towards the enclosure; the entrance was thus made more imposing, and convenient places of shelter were provided for persons waiting to enter or leave the precincts of the citadel.

Such a gateway, of modest pretensions, had once occupied the site of the present building at Athens, but when the grand opportunity arrived, under Pericles, the old gateway had to give way for a structure more in keeping with the later phase of Grecian magnificence.

In his finely conceived plan, the architect, Mnesicles, proposed to mask the whole western end of the Acropolis, by grouping around the gateways additional apartments, thus extending the building on each side of the entrance, as far as the confines of the rock. The primary motive for the disparity in plan of the two vestibules was, no doubt, the central avenue of columns, which was made far more impressive by extending the depth of the outer vestibule, while spacious and cool retreats were at the same time afforded in the side aisles; the inclined way was also made more easy, and the breaks in the levels of the building were made less prominent.

To enclose the western end of the Acropolis, and to retain the higher ground on the inside, the vestibules are flanked by boundary walls, which are utilised for the additional apartments built against them. On the outside, bastions, faced with masonry, jut out from the rock to receive the lateral apartments or wings which enclose the approach, and thus obviate any unpleasant impression which might otherwise have been produced by the gap in the centre of the stylobate. Flanking the inner vestibule, on the higher level, it was originally intended to build two large halls or stoæ, and although this intention was never carried out—the works being suspended on the outbreak of the Peloponnesian war, 431 B.C.—yet evidence of it remains in the commencement of the front wall or colonnade.

The indications of the arrangements for roofing the group of buildings thus contemplated and partly carried out, are most interesting, the only other instance remaining of the fifth century B.C., at all approaching the Propylæa in complexity of arrangement, being the Erectheion, on the same Acropolis. In both buildings each block is roofed separately, and the idea of intersecting one roof by another is quite naturally avoided by the differences in height of the several apartments, and in the levels of the site.

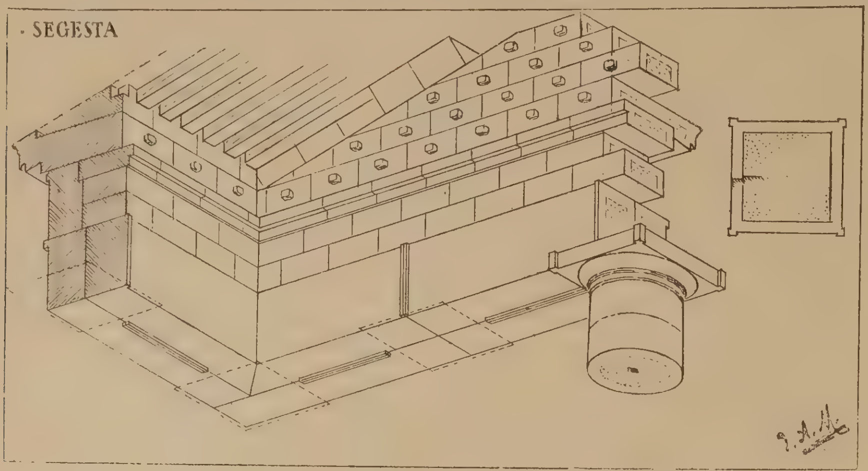
At the Propylæa, it will be seen, on referring to the diagram, that the side walls of the vestibules are thinned on the outside so as to form breaks, with the object of stopping and returning the members of the entablature clear of the roofs of the proposed halls or stoæ; these breaks also serve to receive the eaves cornice of the lower vestibule where it abuts against the frieze of the higher. It only remains to add—in connection with the general arrangements—that the southern wing, which is incomplete, differs somewhat in design from that on the north. The purpose of this variation was probably to provide an approach from the Propylæa to the precints and shrine of Niké Apteros, which stands on the spur of rock in front.

Having now taken a general survey of the structure we will examine the construction more carefully in detail. Beside the evidences of incompleteness above referred to, there are other indications, to be seen in the unfinished character of the surfaces of the walls throughout the building. Like the steps and paving of the stylobate, the general surface of the walling is left in a rough state, but it was necessary—as for the steps—to define the finished face at all internal angles, whether formed by walls or antæ, also under cornices and above the projecting orthostatæ or base stones. Thus there is a draft or sinking all round each wall, leaving the intermediate portion standing out as a raised panel to be worked off later. This draft would not only serve as a guide to the mason in cleaning off, but it allowed of the immediate completion of cornices, and the caps of antæ, and facilitated the proper bonding of the stones at internal angles. A similar draft was also worked vertically in the angles where the steps of the stylobate break forward for the wings.

It may be noted that in jointing the plain walling blocks the front edges are left free to the depth of that portion intended to be worked off; this is done by cutting a bevel on the bottom bed of each course, and on one side of each vertical joint. The purpose of this was to reduce the risk of the stones being chipped during fixing, and to avoid the unnecessary labour of working a fine joint where it was not required.

The blocks are coursed in equal heights of about 1ft. 6in., and they pass through the full thickness of the wall. The orthostatæ course, which is in two thicknesses, rests on a guiding course, or sub-plinth, 9in. high, laid on the top of the foundations.

In cutting down the faces of the walling stones and steps from the rough block it was customary to leave a projecting boss or knob in the centre of the front and back of each stone. We are not sure that the exact purpose of these knobs has been ascertained, although it has been suggested that they may have served to facilitate the moving of the stones. At Assos, where the stones forming the steps of the stylobate vary in length, there are sometimes three or four knobs on



one stone. These projections were eventually worked off the walls, but at the Propylæa they may still be seen on the outside of the walls against which the halls or stoæ were to have been built. On parts which were not visible they were permanently retained, as between the ceilings and roofs of the small wings, also at Segesta on the back of the pediments, and at the Erectheion, on the walls of the eastern apartment, under the floor level.

In considering the beds and vertical joints of the walling stones, it should be remembered that mortar was not used, and, indeed, it would have been quite unnecessary as a cementing material; the stones being large and passing through the wall, stability chiefly depended on vertical pressure and extreme accuracy in the jointing. The stones were, however, united horizontally, by H shaped iron clamps, let into the top, and run with lead, and sometimes also vertically by iron dowels. The top and bottom beds were finished as true planes, so that the stones had a solid bearing throughout; the margins are quite smooth, while the intermediate parts show faint traces of a finely toothed chisel; it is evident, therefore, that in the first instance the margins were left a little in advance of the rest of the bed, and rubbed down afterwards, until they reached the general level. The vertical faces have also rubbed margins, but here the intermediate part is very roughly tooled, and sunk below the rest; in this case it was unnecessary to work a true plane throughout. In the British Museum the student will find stones from this and other buildings, showing the different degrees of execution adopted in working the beds and vertical joints. In some cases the marks produced by each stroke of the clawed chisel are so clearly defined that the size of the implement can be easily ascertained. A few years ago the sections at the Museum were "well exposed"—as geologists say—but the restorations in plaster have rendered many of them inaccessible.

Respecting the jointing of the columns, we cannot do better than quote Dodwell's description in his "Travels in Greece." He says: "Each corresponding frustum contains a hole or mortice, 4in. square and 3¼in. in depth; each hole is filled with a piece of squared cedar wood, fitted exactly into the two contiguous mortices. The centre of this square piece is perforated for the purpose of receiving another piece of cylindrical form. This was probably not designed to give any additional strength to the interior of the blocks, but to serve as a centering on which to turn the upper block in order to ensure a coincidence of the flutings, for it is likely that the flutings were begun, or roughly sketched, before the masses of the columns were placed upon each other, and that they were finished afterwards. The cylindrical inner piece of wood (or pin) was worked exactly true, and evidently turned by means of a lathe; it was hermetically closed between the blocks, and accordingly preserved without the smallest injury. The two outer bits were painted red. The columns of the Parthenon and of other Grecian temples are, no doubt, united in the same manner, for the blocks which have fallen down have the square hole on the surface, for the reception of the wood, similar to those of the Propylæa. A similar expedient has also been found at Thoricus and Agregentum." One of the wood sockets from the Propylæa is in the Bronze Room of the British Museum, and a pin which fitted the perforation is, we believe, in the possession of the Royal Institute of British Architects.

Mr. Penrose, in describing the jointing of the columns of the Parthenon, agrees with Dodwell in thinking that the purpose of the wood sockets and pins was to provide a pivot on which to turn the drums, but he believes this was done to ensure a finer joint by grinding the stones together, and not merely with the object of making the setting-out of the flutings coincide. From unfinished remains, and from the Erectheion inscriptions, we know that the fluting of columns was one of the last operations in finishing off a building. The drums were superimposed as plain blocks, with projecting knobs, or ancones, on the circumference, by which the stones could be raised and turned with the aid of ropes. We are not aware that such knobs have ever been found on a column *in sitû*, but they may be seen on several unfinished drums, discovered some years ago on the Acropolis close to the Parthenon. Instances of columns blocked out, preparatory to fluting, remain at Segesta, Delos, Rhamnus, Thoricus, and the early temple at Sunium; in all these — Segesta excepted—the finished flutings are commenced for a few inches at the top and bottom.

At the bottom the flutings were no doubt finished before the drum was placed, and they are kept clear of the stylobate by a circular seating, worked on the bed of the drum. These seatings, or scamilli, prevented the arrises of the flutings being fractured during the operation of placing the stones, or by unequal pressure at any future time; they were also convenient places in which to make the adjustment for the inward inclination of the axis of the columns, an artistic refinement observed in all the buildings on the Acropolis of the fifth century.

At Rhamnus, where the columns of the peristyle are all left in block, it is interesting to find, in the two columns of the pronaos, that the front flutings are finished, while at the back of the same columns they are left in the preparatory stage of straight planes.

In working the beds of drums, the bearing parts are generally slightly reduced in area by roughly sinking a portion of the surface, so as to leave a smooth outer margin and a central disc as the rubbing parts; the turning of the drums on the pivot was thus more easily accomplished, and the circular sinking served as a receptacle for the marble dust occasioned by the grinding process. (See a drum from an Ionic column in the British Museum.)

As mentioned in a previous article, raised circular seatings are left on the paving stones at the Propylæa to receive the bases of the Ionic columns. The object of these seatings was not so much to protect the mouldings as to keep them clear of the rough surface of the paving.

The delicate base mouldings of the Ionic temples of Asia Minor were often raised above the level of the paving on low square blocks; but this precaution was not so necessary for the Ionic base of Athens, where a large torus generally takes the place of the delicate beading of the Asiatic base, therefore there is no intervening plinth at the Erectheion, the shrine of Niké Apteros, and the temple on the Ilissos (now destroyed).

To prevent fracture, the Asiatic base was always worked with a disc on the bed—like the bottom drum of Doric columns—so that the outer edge was kept free.

To provide continuous support over the various colonnades for the ceilings and pediments, the inter-columniations were bridged over by stone beams, termed by the Greeks an epistylia. For the Doric porticoes these beams are in two thicknesses, and hollowed out in the middle to reduce the weight and thus facilitate the hoisting. By dividing the beam the risk of failure, through natural defects, was reduced, for in single blocks of large scantling the presence of flaws was not always apparent. The detection of such flaws was one of the most onerous and difficult duties of the architect, and is supposed to have been done by sounding the block with a hammer.

At the Parthenon, where the epistylia or

architraves are generally in three stones, the middle stone has but little weight to sustain beyond its own, and merely serves to fill up the gap and ensure a uniform soffit. This may account for the inferior quality of the marble, which, we are told, was used for these interior sections, as compared with that employed for the weight-sustaining outer sections.

In working the longitudinal joints for the Doric architraves of the Propylæa, the middle portion of each section was roughly hollowed out, leaving only a narrow strip along the top and bottom as the bearing parts. The labour was thus greatly reduced, and a more accurate adjustment of the contiguous surfaces was more likely to be obtained. The sections were converted into a single beam by clamping them together on the top at intervals with H-shaped iron clamps. The ends, of course, abutted over the middle of each cap, and at the angles of the peristyle the joint of the outer portion was always on the flanks. At the internal angles the beams were mitred, so that each return had an equal bearing on the abacus of the cap.

In large Doric temples, where the architrave is sometimes made up of three thicknesses, the beams at the angles are generally in two only; this gave increased strength where most required, and allowed the guttæ and regulæ under the angle triglyph to be entirely worked on the end of the outer stone. At the temple of Zeus, Olympia, where the architraves at the angles are in three thicknesses, like the rest, the joint in the flanks cuts through the middle of the guttæ, and the sections of the architraves vary in thickness, but these irregularities were concealed by a thin coating of very fine stucco.

For the portico of the pseudo-Doric temple at Samothrace the architrave was in two equal thicknesses; but at the angles a wider stone was used for the outer section, so that the return gutter could be worked on; and to make the joint on the soffit agree with the others the stone was reduced in thickness at the back to within 18in. of the return end.

To prevent fracture during the operation of placing the epistylia, and also in case of unequal settlement, it was cutomary to cut down the outer margin on the top bed of the abacus of the cap; a raised seating was thus left, on which the ends of the epistylia were bedded, free of the outer arris. This precaution was especially necessary for the early or archaic Doric cap, the extreme projection of which would, in case of unequal pressure, tend to produce a lateral strain on the column. In the fully-developed Doric cap, where the echinus is not so pronounced, and the transition from the shaft to the abacus more gradual, the liability to fracture is lessened, so the scamillus was brought nearer to the edge of the abacus.

To avoid flushing or chipping at the joint between cap and column, due to strain on the cap, the outer margin of the bottom bed of the cap is also kept free, and the arris of the joint is bevelled—sometimes this is emphasised by additional V-shaped sinkings, or annulets—both above and below the joint.

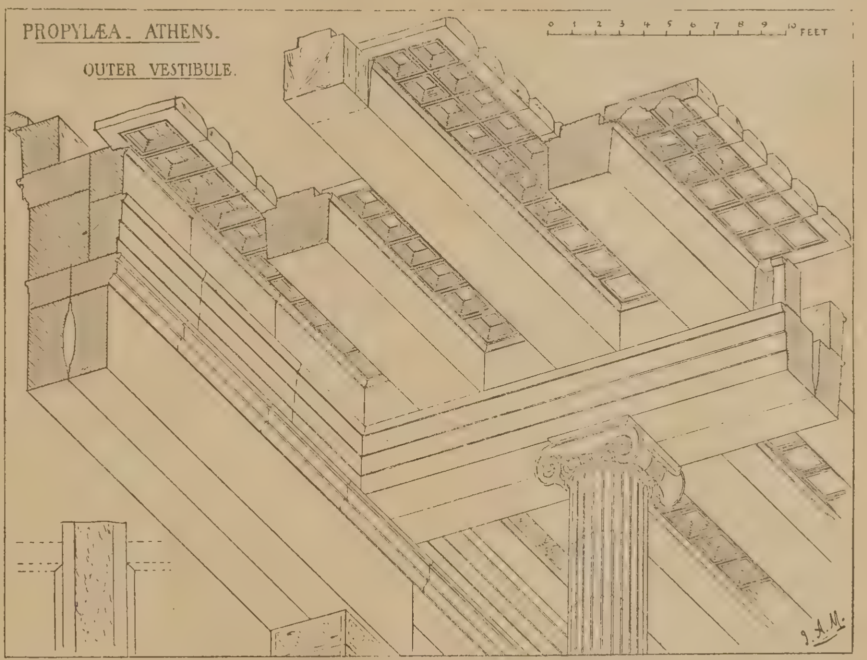
In the Ionic type the joint between cap and column was invariably above a bead worked on the column, but the same precautions were taken at the bottom and top of the cap to keep the edges free.

Another expedient of a temporary character to prevent the chipping of the angles while the stones were being placed has yet to be mentioned. At Segesta, where building operations were suspended at an early stage of the work, projecting fillets or pads are left at the four angles of the abacus of each cap, and along the joints of the architraves; the latter are in two thicknesses, and in the case of the longitudinal joint on the soffit, the fillet is stopped at the caps, so as not to interfere with the bedding of the stones. On the outer face, the fillets which protected the vertical joints have been worked off, but at the back they still remain (see diagram).

Unlike the Doric, the Ionic type of architrave seems to have had its origin in a wood prototype of thin sections superimposed flatwise, and increasing in width towards the top, to protect and conceal the joints; yet the groove or panel on the soffit suggests that the lower portion of the beam consisted of two pieces on edge, placed a few inches apart. When this type was translated into stone, the panel was often enlarged and enriched with mouldings, and the joints on the soffit were omitted. (See the remains of the later temple at Ephesus in the British Museum.) The stones composing the architraves of the mausoleum are laid flatwise, and the soffit has a simple groove. (See restoration in Museum.)

So far as we know, the sinking on the soffit is confined to Ionian buildings on the western coast of Asia Minor and the outlying islands; most, if not all, of these examples are of later date than the buildings on the Acropolis at Athens, and though their distinguishing characteristics were, no doubt, based on archaic prototypes, yet the Athenian architects in their fusion of the Doric and the Ionic, invariably omitted the panel, and, in the case of the Propylæa, resorted to a longitudinal joint on the soffit of the Ionic architrave. The respective proportions of the two orders was, however, maintained, and considerable skill is shown at the Propylæa in reconciling the differences.

On the level of the top of the Doric architrave, a moulded band is carried around the interior of the outer vestibule to serve as a plate for the ends of the Ionic architraves, and the facia of these architraves is also continued around the walls as a frieze, on which rest the ends of the ceiling beams. Two stones of the band, or plate, are in the British Museum, and are interesting, as showing the lewis holes for hoisting, and the places for inserting the H-shaped iron clamps and the dowels. A similar band is carried around the inner portico, above the Doric architrave, but there is no internal frieze, so the ceiling beams in this case rest on the band.



The stone ceiling on the Propylæa was probably the finest in all Greece, the only competitor, which runs it close, being the north portico of the Erectheion. In both, the greatest span is 19ft., and the length of the longest beam about 22ft. At the Propylæa the beams were 2ft. 9in. by 2ft. 4in. in section, those over the side compartments of the outer vestibule weighing about eleven tons each. Every precaution seems to have been adopted to restrict the weight of the ceiling; the deep coffers of the lacunaria stones contributed to this object, besides serving as an adornment, and the weight was still further limited by roughly cutting away the angles of these stones at the top. The beams were placed about 3ft. apart, and the facia was returned at the ends of each space by fitting in a thin slab. At the angles the mouldings and inclined facia are mitred, and all projecting mouldings throughout were relieved of the weight of the beams and lacunaria stones by a slight sinking, or draught, along the top.

The lacunaria stones were narrow slabs about 18in. wide, laid in rebates cut along the top of the beams; at the tranverse joint the slabs were rebated to overlap, which gave additional security in case of fracture. On the soffit these joints are concealed by a raised bead around the coffers. The ceilings of the small wings were entirely of wood, the ends of the beams being let into notches cut out of the back of the corona stones. The roofs of these wings were hipped in front, and notches were cut on the top of the corona stones for the feet of the rafters. At the back the roofs abutted against the boundary walls, in which chases are cut to receive the tiling.

The northern wing is exceptionally interesting on account of the windows in the division wall. The projecting cills of these windows are continued round the room as a string, and the jambs are treated as antæ. This method of finishing the ends of walls and external angles by slight pilaster-like projections was universal in Greek work, and probably had its origin in the wood posts which were placed in similar positions in earlier times, to sustain the walls of sun-dried brickwork, and to stop the plastering; evidence of this was met with at the pre-historic palace of Tiryns.

The influence of timber construction on design in stone is also apparent in the Doric frieze, where the triglyph blocks, no doubt, represent the ends of wood beams resting on the architrave, while the metopes represent the panels which were fitted into grooves cut in the sides of the beams to fill up the intermediate spaces. In timber construction these spaces were probably sometimes left open, and in the case of temples in antis, some of the metopes may have been fitted with shutters. Euripides, no doubt, had something of the sort in his mind when he made Pylades notice the open space between the triglyphs by which he and Orestes could enter the temple of Diana at Tauris.

In large buildings the metope slabs, whether sculptured or not, were generally let into grooves, cut in the sides of the triglyph blocks, as at the Parthenon and the Propylæa, where they serve as a casing to the rough intermediate backing stones; but for the temple of Zeus, Olympia, the metopes for the frieze of the peristyle were massive blocks, of about the same thickness as the triglyph blocks, and the latter were rebated to overlap the metopes in front. Where the metopes were sculptured—in front of the pronaos—the slabs were let into grooves.

For smaller buildings the frieze consisted of stones, each of which comprised a triglyph and a metope; the triglyph end of each block was then rebated to receive the metope end of the adjoining block. This method was adopted for the small wings of the Propylæa, the temple at Rhamnus, the Metroon at Olympia, &c. The stones composing the frieze were generally dowelled to the architrave, and secured to each other by iron clamps. On the top they were steadied and protected by the broad stones of the corona or cornice, which afforded an even bed for the roof.

(To be continued.)

PARIS FLATS.

By A. ANDERSON.

THE past few years have witnessed a tremendous evolution in the construction of the flat in Paris. Architects have been put on their metal, have borrowed suggestions here, there, and everywhere, and, it must be confessed by every impartial observer, have amply justified the proverbial reputation of their nation for ingenuity. Nowadays, what is known as "confort moderne" is a *sine qua non* with every tenant. The expression is held to include abundant light and air, a plentiful supply of fresh water, bathrooms and dressing-rooms fitted up by the landlord with all necessary appliances, lifts, luxuriously furnished halls and carpeted staircases, electric lighting, steam heating, telephones, and, indeed, all the resources that invention has put at our disposal. In addition to this, the internal decoration of even cheap rented flats has to be carried out in an artistic manner that ten years ago would only have been seen in the houses of the very wealthy. The natural result has been that there has been a tremendous exodus going on for some time past from houses that only yesterday, it seems, were looked upon as models of everything that was desirable, and in many erstwhile fashionable thoroughfares the ticket, so ominous in the eyes of the landlord, "A Louer," protrudes from every doorway, eloquent testimony to the attractions exercised by "confort moderne" somewhere else. The average rent of one of the new pattern flats in the more fashionable residential quarter of Paris, within a certain radius of the Champs Elysées, may be put down at from £60 to £85 per annum for flats containing four or five rooms, up to £200, £300 and £400 for those containing ten or a dozen or more rooms. There are, it is true, a certain number of flats to be found in Paris, the rents of which run as high as £600 and even £800, the record price, but they may be almost counted upon one's fingers and are built in specially favoured positions.

In the more outlying portions of the fashionable quarter "confort moderne" may be exacted by the tenant ready to pay a rent of £50 or even £35, while in the suburbs the minimum price of comfort may be put down at £25 and, in some instances, even less.

A typical flat of modern construction at moderate rental may be found in the neighbourhood of the Trocadero for example. "Found" is perhaps rather an ambiguous expression, for the flats are all let almost before the mortar is dry.

The plans, reproduced in our centre plates, by permission of the architect, M. H. Hanin, are of a house in the Rue Vineuse. The house consists of a ground floor and six upper storeys built on cellars. On each floor there are two flats, one of four the other of three rooms, each of the bedrooms having a dressing-room adjoining. It will be seen that not only can every room be entered directly from the hall, but they all communicate with one another. The servants' rooms are situated, as is usual in Paris, on the sixth floor. The rentals are from £30 to £55 per annum. This particular house has been built for about eighteen months and may be taken as a very good specimen, if not as "the last word" of its category.

LANGSETT WATERWORKS.

VISIT OF SHEFFIELD ARCHITECTS.

SOME forty to fifty members of the Sheffield Society of Architects and Surveyors visited the works of the new Sheffield reservoir at Langsett on the 2nd inst., on the invitation of Mr. E. M. Eaton, C.E., the consulting engineer to the Corporation, who is responsible for the scheme. The various features of interest were ably explained by Mr. Watts, the resident engineer. The works were commenced in October, 1897. The first portion of the work inspected was the discharge tunnel, leading to the valve well or shaft. The total length of this tunnel is about 400yds. the shaft being in the centre. At this point, the supply of water will be governed by valves connected with a vertical pipe, worked by hydraulic pressure. In the well will be fixed a pipe, 43in. in diameter, which will carry away the water for consumption, subsequently supplying other pipes for the needs of the citizens of Sheffield, and also to meet the compensation claims. In connection with the valve well, it may be interesting to state that the total capacity of the reservoir is 1,400,000,000 gallons, and the maximum discharge will be about 70,000 cubic ft. per minute. The springs of water have been a source of many engineering difficulties in the construction of the foundations. Retracing their steps through the tunnel, the party returned to the surface, where Mr. Eaton and Mr. Watts showed the extent of the reservoir, the area being 120 acres, and the greatest depth 100ft. Another descent was then made deep into the earth; after going down a number of ladders, the party found themselves at the bed of the embankment, which is to stretch 400yds. across the Don Valley in order to dam up the water. The average depth of the embankment will be 85ft.; at one point the depth will be 119ft., this being its deepest part. The excavation of the trench has been practically completed. Concrete is being used; the difficulty with the springs has been overcome, and the work is proceeding expeditiously, although every care is being taken in order to ensure the stability of the dam. Concrete will be carried to within a few feet of the surface. At the base the embankment will be 630ft. wide, and at the top 28ft. When the surface was again reached, the gathering ground comprised in the 5,200 acres belonging to the Corporation, and the many ways in which the spot has been endowed by Nature as the source of a great water supply were described. It is hoped that the reservoir will begin to fill in four years from the present time. After an inspection of the plans of the work in the engineer's office, the party were entertained to tea by Mr. Eaton. In referring to the character of the work at Langsett, Mr. Eaton alluded to the bursting of a reservoir at Dale Dyke. He said that catastrophe was not owing to bad workmanship, but to a slip of the bank. The ground sprung and the puddle was unable to sustain itself. At Langsett every precaution that experience could dictate was being taken in order to make the embankment the most stable of its character in the kingdom.

Deptford Loan Picture Exhibition.—The loan exhibition of pictures which had been held at Sayes Court, Deptford, during the previous fortnight, closed last Sunday week. During the time the exhibition was open, there were upwards of 12,000 visitors. The highest number in one day was 1,591, and the lowest 554.

A Vicar Painting his Church.—The vicar of St. John Baptist Church at Spalding, the Rev. C. W. Macdonald, M.A., is now engaged in painting the exterior of his church and schools. They badly needed a coat of paint, but there were no funds available, whereupon the vicar himself undertook the task. He has already spent between four and five weeks upon his self-imposed contract, which he hopes shortly to complete.

Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor.

BUILDERS' FOREMEN AND CLERKS OF WORKS' INSTITUTION.

To the Editor of THE BUILDERS' JOURNAL.

LIVERPOOL.

SIR,—As I am desirous of becoming a member of the Builders' Foremen and Clerks of Works' Institution, I would esteem it a great favour if you would be good enough to inform me to whom I should make the necessary application.—Yours, &c., J. L. J.

Application should be made to the Secretary of the Provident Institution of Builders' Foremen and Clerks of Works, 9, Conduit Street, Regent Street, London, W.

SHAVINGS AND SAWDUST AS FUEL.

To the Editor of THE BUILDERS' JOURNAL.

SHREWSBURY.

DEAR SIR,—I make a great deal of shavings and sawdust, and although I have a steam engine, cannot use them for fuel. The draught in the engine draws the material up the chimney only partially burnt and causes a nuisance to neighbours. I should be glad to know how to remedy this. Details of how to make fire-lighters from shavings and sawdust would oblige. SAWDUST.

To use shavings and sawdust for making steam requires a large firebox to the boiler and a split firebrick bridge, that is, the bridge made with a cavity right across like a double brick wall, with inlet below the firebars so that a good supply of air can be obtained at this point without passing over the fire, the draught being regulated by a flap door over the inlets. For machinery for the manufacture of fire-lighters from pressed sawdust, apply to such a firm as Yeadon and Co., Albion Place, Leeds, or the Universal Patent Fuel Machine and Manufacturing Co., Ltd., 32, Fenchurch Street, London, E.C.

HENRY ADAMS.

SURVEYORS' INSTITUTION EXAMINATIONS.

To the Editor of THE BUILDERS' JOURNAL.

LONDON.

SIR,—Will you kindly inform me through the columns of your valuable journal which books I should require to work up for the Surveyors' Institute examination, and which courses of lessons will be best to take up, say, at the Polytechnic, during the coming winter evenings for the same examination.—Yours, &c. W. H. E. L.

It is best to adhere to the list of books published in the Syllabus of Examinations, obtainable from the Secretary of the Surveyors' Institute, 12, Great George Street, Westminster, S.W. If entering in the "Building" Section, a good class on quantity surveying should be attended during the winter, where the fees are not so low that the class becomes overcrowded. The lectures at University College promise to be good. Land surveying must be learnt practically.

G. A. T. M.

STONE CHURCH, KENT.

To the Editor of THE BUILDERS' JOURNAL.

MANCHESTER.

SIR,—I should like to inquire whether you can tell me in what book I could find any particulars relating to Stone Church, Kent. I have a short description of it to write, and cannot get any particulars of much service.—Yours truly, ENQUIRER.

[Perhaps some of our readers can oblige with this information.—ED.]

ROAD-MAKING AND EXAMS. FOR SURVEYORS.

To the Editor of The Builders' Journal.

Walthamstow.

Sir,—As a constant reader of your valuable paper, will you kindly inform me in the next issue of the paper what you consider the best books to obtain on the construction of roads; also where to get information as to the examinations for road surveyors. Thanking you in anticipation.—Yours, &c., A. T. B.

The section of "Road-Maker" in "Specification" (published at these offices, price 5s.) will probably give what you require. Some articles on road-making will shortly appear in our columns. With regard to examinations, apply to the Secretary of the Incorporated Association of Municipal and County Engineers, 11, Victoria Street, S.W.

ARCHITECTURAL DESIGN.

To the Editor of The Builders' Journal.

Brighton.

Sir,—I shall be glad if you can inform me through your valuable journal of a book on architectural design, as I am shortly joining a class at the School of Art here.—Yours, &c., "PUPIL."

The best book you can have is Fletcher's "History of Architecture," published at 12s. 6d. This can be obtained from Mr. B. T. Batsford, of 94, High Holborn, London, W.C., post free for 10s.

COLOURING OF ARCHITECTURAL PERSPECTIVES.

To the Editor of The Builders' Journal.

Longton.

Sir,—Will you kindly inform me if there are any books published on the colouring of architectural perspectives in water colours?—Yours, &c., J. F. J.

Possibly some useful hints might be gleaned from Spier's "Architectural Drawing" (B. T. Batsford, 94, High Holborn, W.C.); but as a matter of fact each draughtsman must develop for himself, though a few personal lessons from a good art master might be advisable. Many commence by covering the whole surface with a light wash of yellow ochre and then follow on rapidly with local colour while the paper is still damp. This colour should be applied of full strength at once if there is to be vigour in the result, a dry cloth and the penknife being useful aids for the retention and production of high lights, while shadows may be applied with a soft pencil or dense sepia. Some men confine themselves entirely to the use of yellow ochre, cold sepia, light red, and indigo, obtaining all other tints by mixing; and many others draw in their outlines in brown ink. G. A. T. M.

WEIGHT OF ROOFS.

To the Editor of The Builders' Journal.

Leeds.

Sir,—Can you give me any particulars with regard to the weight of various roofs, I mean calculating the weights, &c.? If an iron joist was inserted, how much weight would you reckon for the roof, that is for slated roofs, zinc roofs, &c.? Do you allow 1cwt. for each square foot of roofing when slated? Also, what should be added on for snow and wind pressure, and how would you allow for glass and iron roofs? I should be glad if you know of any books on the subject named.—Yours, &c., B. G.

The permanent load on a roof consists of the weight of truss, with purlins, rafters, and roof covering, together with ceiling, lantern light, skylight, &c., if any. The temporary load consists of snow and the effect of the wind. The loads per square foot of roof surface, as given in the writer's "Practical Designing of Structural Ironwork" (Spon, 8s. 6d.), p. 173, are:—Countess slating, 8lb.; slate battens, 1½lb.; slate boarding, 2½lb.; common rafters, 3lb.; snow, 5lb.; wind (average vertical load), 30lb.; purlins and trusses (iron), 7lb.; purlins and trusses (wood), 10lb.; or, say, 56lb. per foot super of sloping surface, or 60lb. per foot super of horizontal area covered. Lead covering may be taken to be the same weight as slating, zinc one-fifth, corrugated iron one-third, and tiles double the weight of slates. Part IV. of "Notes on Building Construction" (Longman, 15s.) gives tables of weight of roofs and roof coverings. A lath and plaster ceiling with joists weighs about 11lb. per foot super. An ordinary skylight weighs about the same as the slating displaced. HENRY ADAMS.

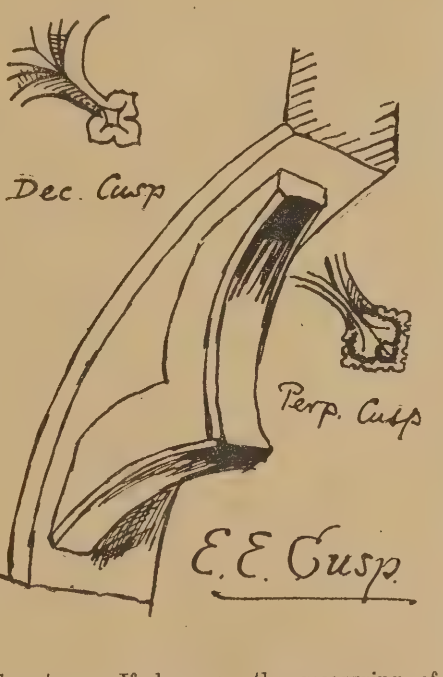
MEASURING UP CUSPING.

To the Editor of The Builders' Journal.

Nottingham.

Sir,—Could you kindly inform me how to measure up cusping, and the difference between E.E., Dec., and Perp. cusps? Is there any work from which I could get particulars? A. S.

In quantity surveying, cusps would be measured up by numbering them as "extra only" for labour involved above the cost of the stone. If, however, the measuring of cusps in an old window, for the purpose of making a drawing of it, be meant, this would be accomplished by fixing the positions of the main points, horizontally from mullions and vertically from sills, by means of plumb-bob and rule. E.E. cusps generally spring from the flat soffit of the arch, while those of the later periods are in continuation of chamfer mouldings, being distinguished by the ornamentation of the terminals. See Parker's "Glossary," and the illustration on this page. G. A. T. M.



RIGHTS OF LIGHT.

To the Editor of The Builders' Journal.

Walham Green, S.W.

Sir,—Will you inform me whether in rebuilding a wall that has at the present time an existing ancient light I could increase the size of this light (a portion of the new light being exactly in the same position as the old one) without prejudicing the right of the entire light, or could only the increased portion of the new light be blocked up?—Yours, &c., H. F.

The light can be enlarged without prejudicing the right to the ancient light. The increased portion only can be blocked up. Great care should be exercised to preserve evidence of the exact position and dimensions of the ancient light. H. P. B.

GOTHIC TRACERY WORK.

To the Editor of The Builders' Journal.

Bristol.

Sir,—Could you inform me through your valuable paper what is the best book to get information on Gothic tracery work, with price, and where to obtain same?—Yours, &c., JOINER.

We recommend "The Infinity of Geometric Design Exemplified," by R. W. Billings, with forty steel plate engravings, exhibiting upwards of 200 figures, with an introduction, 4to. cloth, nett 8s. 6d.; or "A Treatise on the Rise and Progress of Decorated Window Tracery in England," by Edmund Sharpe, M.A., with sixty-six engravings on steel, and ninety-seven woodcuts, two vols., 8vo., cloth, price 15s. nett. These books can both be obtained of Mr. B. T. Batsford, 94, High Holborn, London, W.C.

CERTIFICATES FOR MASTER BUILDERS.

To the Editor of The Builders' Journal.

Kettering.

Sir,—I am a young master builder, holding South Kensington certificates in building construction. Will some reader of your journal kindly recommend further studies?—Yours, &c., PROVINCIAL.

We should certainly advise our correspondent to obtain the Sanitary Inspector's Certificate of the Sanitary Institute. Few things inspire a builder's customers with more confidence in him than the assurance that their sanitary work will be thoroughly well done. For particulars apply to the Secretary, 74a, Margaret Street, W. G. A. T. M.

SEWER GAS.

To the Editor of The Builders' Journal.

London, E.C.

Sir,—I shall be much obliged if you will kindly answer the following through your valuable publication.

(1). What is the chemical name and symbol of sewer gas?

(2). What is its weight as compared with pure or ordinary atmosphere?

(3). If a soil pipe were connected directly to the trap of a w.c. without any fresh air inlet, would not an ordinary two gallon flush entirely destroy the "seal" by syphonic action?—Yours faithfully, TIN.

(1). "Sewer gas" is a conventional term used to denote a gaseous compound found in sewers, resulting from the putrefaction and decomposition of stagnant or flowing sewage. Every imaginable description of refuse is included under the name of "sewage," such as excreta, urine, fouled liquids, manufacturing refuse, &c., so that the actual composition of sewer gas in any sewer varies continually, according to the specific nature of the sewage passing at any particular period. Unventilated sewers permit the accumulation of sewer gas in a concentrated form, but in well ventilated sewers the gases of decomposition are mixed with large volumes of air, and the sewer gas then approaches more nearly to the character of the ordinary air of towns. The following gases are found in sewer gas, viz:—carbon dioxide or carbonic acid (CO_2); hydrogen sulphide or sulphuretted hydrogen (H_2S); methyl hydride or marsh gas (CH_4); Ammonia (NH_3); together with numerous fœtid hydrocarbon and nitrogenous vapours arising from decomposing organic matters.

(2). From the foregoing remarks it will be seen that the comparative weight density of any particular volume of sewer gas varies according to its composition, and can only be determined by actual experiment.

(3). In the case of a single w.c. connected to a soil pipe, a two gallon flush would not—under ordinary circumstance—destroy the water seal of the closest trap by syphonic action. To avoid any risk of accidental syphonage, it is desirable to provide an antisyphonage or air pipe. When two or more closets discharge into the same soil pipe, each trap should invariably be provided with an antisyphonage pipe. T. E. C.

HOUSING OF THE WORKING CLASSES.*

BY CHARLES J. HAIR, A.R.I.B.A.

I HAVE been asked by your Committee to give you my views on the housing problem. I propose to confine myself to giving you a few of the practical difficulties that are usually met with in dealing with this matter, from an architect's point of view, and the way in which they are usually overcome. The main points which an architect has to bear in mind at the outset are:—

1. *Site.*—It is generally found that the first of the new buildings have to be of a kind that will re-house the people displaced on the same area of ground, and consequently they must, of necessity, be several stories in height, in order to get sufficient air space between the different blocks. The land generally has such a high commercial value that it is impossible to make a profit by building workmen's dwellings, unless a prohibitive rent is charged for them. This has partially been overcome, in some cases, by devoting the lower part of the building to shops, and thereby getting a commercial rent for valuable frontages.

2. *Class of Dwellings.*—The next point to be considered is the kind of dwelling to erect, whether to re-house the people in lodging houses, or artisans' dwellings, and if the last named, whether they shall be "self-contained," *i.e.*, each flat a separate cottage in itself, or "associated," *i.e.*, rooms let off separately with common sculleries and w.c.'s.

Of course, one should be governed by the class of people that have been turned out, and give accommodation accordingly. Here I think I am right in saying, that up to the present it has been found impossible to get the very poorest (who are generally the class that has to be catered for) to inhabit the new buildings.

3. *Economy of Design.*—The third and perhaps the most important point to the architect, is that he must bear in mind that the buildings have to show a sufficient return to pay for themselves in thirty years, and consequently everything must be designed with a strict regard to the cubic inch; for instance if all the partition walls in a big building are made 2½in. thick, instead of 5½in. (which is the finished thickness of a 4½in. brick wall), a saving will be made of a foot in every 60ft., and in a five-storey building this means over £100. The architect must also suppress to a certain extent the artistic side of his nature and be severely practical in regard to design. As I had it very aptly put to me once, "If he must introduce 'poetry' into the elevations, it must be *very cheap* 'poetry.'" I think it is possible to make a quite plain building look well, by keeping each feature of good proportion and making a speciality of the cheaper kinds of ornamentation; for instance, broad bands of light-coloured bricks have a wonderful effect in brightening up a big building.

I now come to speak of the buildings themselves.

Lodging-houses.—First as to lodging-houses. I think this class of building is the nearest approach to re-housing the poor that has been made; this is chiefly due to the fact that everything is concentrated—there is a general kitchen, living room and scullery, common to all the inmates. The dormitories are plain, square rooms, divided off into cubicles, and have no chimneys, which are a very serious expense in other classes of workmen's dwellings. Again, the sanitary arrangements are all concentrated to one or two points. The administrative and staff quarters are the most expensive part of the building.

The first main idea for a lodging-house is a big common room on the ground floor, with dormitories above. As a working man said to me once, why not build a big shed that could be opened on one side, cover the floor with asphalte, and turn the hose on it every morning? But now-a-days we want something a little more elaborate than this; and in place of the one common room, there are dining and recreation rooms, kitchens, lavatories, bathrooms, box and locker rooms, to be provided for, to say nothing of washhouses and store-rooms, &c., for the administration of the building.

The dormitories have to be divided into separate cubicles, so that each individual has a room to himself.

This kind of building has been made to pay in London, and if it is possible to give this extra accommodation, so much the better; but I think that a somewhat cheaper scheme should be devised in the poorer districts to compete with the demand for a fourpenny doss. This can only be done by doing away with the greater portion of the administrative accommodation. I have made a rough diagram* of a lodging-house of this kind, which would accommodate ninety-six men if built two stories high only. This building is designed somewhat on the lines of existing lodging-houses in this town, though, of course, with extra sanitary accommodation. The plan is composed by placing two large dormitories forty feet apart, and planning the entrance and staircase between them. The entrance is flanked on the left by the check-taker's office (which is placed in this position so that he can supervise the entrances to the dining-room and staircase), and on the right by a cloak-room, which would be fitted with lockers for the use of the lodgers. The right wing of the building contains the dining-room and kitchen, and the left wing contains the caretaker's house and lavatories and bathrooms for the men. The w.c.'s are placed at the back, and are open to the yard, but there is a covered passage to them from the central hall. The upper floors consist of two dormitories, which are on the left and right of the central staircase. Two w.c.'s and a sink-closet are provided on each floor, opening off the staircase corridor. I propose to heat the building by means of central stoves for the dining-room and open chimney-hearths elsewhere. The baths would be heated by gas, as the addition of a boiler-house would be too expensive. I have also made no provision for a laundry, as in such a small building it would not pay. This is only a rough outline of the scheme, but I think it would be possible to make it pay at 4d. per night.

Artisans' Dwellings.—This is perhaps the most popular form of re-housing the working man, as it provides separate dwellings for each family. There are two kinds of artisans' dwellings, the self-contained and associated. The self-contained is, I believe, the most successful plan.

In connection with some dwellings which I have in hand for the Southampton Corporation, there are one or two points which I think are improvements on some of the earlier forms of dwellings. The most important is that the w.c.'s are disconnected from the living and sleeping rooms. I have often noticed that in plans of model dwellings the w.c. is put next to living rooms and bedrooms, and in some cases even between two of these rooms. The most important point to aim at in designing this class of dwelling is to get as many rooms as possible opening from each staircase. In this case there are three tenements on each floor, and each has its front door opening directly on to the landing, so that no room is wasted in corridors. In squaring out a plan for comparative cost, corridors form a big item of expense and give no return; this is a great drawback to the associated plan. These dwellings all enter through the sculleries, which is an advantage, as it acts as a disconnecting lobby between the living room and the staircase. In cases where the living rooms open directly on the staircase, complaint is often made of the noise and dust from the traffic up and down the stairs. Each scullery is provided with a sink and a copper, and has two windows, one opening to the staircase. The coppers are set in the chimney breasts with the flues on either side; this is done for economy of space, and also to provide a steam flue to carry off the steam when the coppers are in use. The same flue is used for steam and smoke, but is furnished with a damper so that the steam is only admitted to the flue when required. The circular fronts to the copper furnaces are of glazed brick.

Each living room is provided with a food cupboard, ventilated to the open air, and a dresser with plate rack over.

With regard to sanitary fittings, the sinks are strong stoneware, specially made 10in deep, and connected to 2in. galvanised iron wastes, with drawn lead pipe with D. trap under each sink; the upper end of the waste is taken up 4ft. above the eaves for ventilation. The w.c.'s are of strong fireclay, and the soil pipe is ventilated at the top, and has special screw inspection caps at each connection; this is most important, as in case of a stoppage, it can be put right without breaking the pipe. The ventilating pipes from the soil pipes to the front elevation are terminated with a Boyle's Extract Ventilator, which is enclosed in an ornamental turret.

Dust.—The difficulty of providing for the disposal of dust and house refuse has been overcome by the provision of a dust shoot opening off each landing, which is constructed of 9in. glazed stoneware drain pipes, built into the wall, discharging into a movable receptacle at the bottom, the top of the pipe being ventilated above the eaves.

Balconies.—There is one thing which I think would be an improvement to the plan of these Southampton dwellings, and that is small balconies to each tenement.

The ground floor has been devoted to shops on the street front, and the entrance to the dwellings above is from a common yard at the back of the building.

Materials.—With regard to the materials the most important thing to remember is that everything must be as fireproof as possible.

For walls good bricks are the cheapest and best materials, though I do not think the time is very far off when we shall make a greater use of concrete for building walls. There is a very good hollow fireclay brick made by the Shepwood Company, 2½in. thick for internal walls which can be bought either glazed or plain, or with a fluted surface for plastering. These were used in the bath-rooms and w.c.'s at the lodging-houses here, and are, I consider, a great success.

Glazed Bricks.—This is the best and most sanitary building material that can be made, but has the drawback of being very expensive; however, I think that it is the only material that should be used for dados in corridors and staircases, and round sculleries and w.c.'s, and quite justifies its extra cost, although it is generally the first item that is cut out when the cost of a building has to be reduced. To clothe the walls of a scullery from floor to ceiling with glazed bricks would be extravagant, but it is a necessity as a dado.

Floors.—These have to be of concrete, and the most usual form is 6in. thick on rolled steel joists, the concrete being made either with furnace clinker or coke breeze. This is at present the cheapest kind of concrete floor, but has the drawback of being very heavy, and I believe that when the nature of concrete is better understood, these floors will be made about 3in. to 4in. thick; in fact I have done them 4in. thick, but only in small rooms. There are several patent floors made, but I have found it best and cheapest as a rule to stick to the plain solid concrete and steel joists.

The best covering for floors is 1in. boarding for living and bed-rooms, nailed directly to the concrete, and a rendering of granite-dust and cement for sculleries and w.c.'s.

Stairs.—Stairs should be constructed of good granite concrete moulded *in situ*, and should be ventilated by large unglazed openings on each landing.

Roofs.—There are, broadly, two kinds of roofs—"pitched" and "flat." The pitched roof is the best for appearance, and also for keeping out the wet, but has the drawback that it is not, as a rule, fireproof. The flat roof is fireproof, very ugly, and, in crowded districts, it can be made use of as a playground for the children, or as a washing and drying-ground.

CENTRAL SCHOOL OF ARTS AND CRAFTS.

Work will recommence on Monday, Sept. 18th, at the Central School of Arts and Crafts, 316, Regent Street, W., (opposite the Polytechnic), which is conducted by the Technical Education Board of the London County Council. The school, which is entering on its fourth session (under the general direction of Mr. George Frampton, A.R.A., and Mr. W. R. Lethaby) has already more than justified its existence, and signs are not wanting that it is beginning to exert a beneficial influence upon the trades represented there. The object of the school is to provide for craftsmen engaged in trades, where artistic handicraft is required, a training both in the principles of design and in its application to their specific industries. The teaching is throughout specially directed to the requirements of the trades in which the students are engaged, and the school is, within certain limits, only open to those actually working at such trades.

At present the school provides teaching mainly for those engaged in bookbinding and silversmiths' work, and in certain branches of the building trade. Other departments, however, are being opened from time to time, as a demand arises, and it is hoped that from the nucleus which exists at the Regent Street school there may eventually grow a complete system of artistic and technical instruction, which will ensure for the artisans of the Metropolis that sound and practical artistic training which, under present conditions of production, they so greatly need.

The instruction given is very complete. In addition to the large general classrooms for modelling and design which are equipped with art examples of the best periods, separate workshops are provided, fitted with all necessary tools and appliances for "large" and "small" silver-work, goldsmiths' and jewellers' work, chasing, engraving, and repoussé work. These classes are in charge of Mr. W. Augustus Steward and a staff of assistants. There is also a class in enamelling under Mr. R. Atkins. The bookbinders' classes, under Mr. Douglas Cockerell, are also an important section of the school, in which quite remarkable results have been achieved. Special classes dealing with the building trade are those in architecture (Mr. Halsey Ricardo); modelling and ornament as applied to architecture (Mr. Roscoe Mullins); design for furniture and metal work (Mr. C. Spooner); stained glass (Mr. Christopher Whall); ornamental lead-work (Mr. F. W. Troup); stoneworking for architects (Mr. Hook); and lectures (free to architects and builders) on Mechanics of Construction (Mr. Percy Kirk). Modelling from the Life is taught by Mr. Mullins; Drawing from the Life, by Mr. Louis Davies, Mr. H. Wilson, and Miss M. Alexander; Wall-paper and Textile Design, Heraldic Drawing, Lettering and Decorative Black and White, by Mr. Catterson-Smith. Other classes are Wood-carving and Gilding (Messrs. Stuttig and Underwood), in which an attempt is being made to bring together once more carving and gilding in picture frames of simple and original design; wood-cuts in colour, by a method based on Japanese practice (Mr. F. Morley Fletcher); embroidery (Miss Ellen Wright, directed by Miss May Morris).

Some adjoining premises have been secured by the Technical Education Board, to meet the continual increase in the attendance at the school. Additional accommodation will thus be provided for some of the existing classes, and new classes will be started in ornamental writing, suitable for illuminated addresses, &c. (Mr. Edward Johnstone), and lithography, which will be carried on as a branch of the Board's Lithographic and Photo Process School at Bolt Court.

The fees are quite nominal, one inclusive payment of half-a-crown per month admitting to all classes (with the exception of the Life Classes). Workmen in receipt of less than thirty shillings a week, pay one shilling a month, and apprentices, learners and improvers are admitted free. Full particulars of any of the classes, and forms of application can be obtained from the Curator, at the School, 316, Regent Street, or from the Secretary of the Technical Education Board, 116, St. Martin's Lane, W.C.

BELFAST CATHEDRAL.

The Foundation Stone of the new Cathedral of St. Anne, to be erected in Donegal Street, on the site upon which St. Anne's Church now stands, was opened last Wednesday by the Countess of Shaftesbury. A design was originally prepared for the Cathedral in the Gothic style, but the great cost, about £200,000, prevented this being carried out. It was accordingly resolved to adopt a design of the Byzantine type of architecture, the estimated cost of the erection of a building of that character being from £60,000 to £70,000. The new edifice, when completed, will be the largest place of public worship in Ireland. It will provide accommodation for nearly 4,000 persons, while St. Patrick's Cathedral, Dublin, has accommodation for about 2,000 only, and Christ Church Cathedral, for about 1,000. About £17,000 having been subscribed, the promoters of the work have felt themselves justified in commencing operations, and a contract has been entered into for a portion of the work, which will cost £19,384. This portion of the undertaking will consist of what may be called the shell of the nave and aisles of the edifice, the intention being to postpone the erection of the imposing front facing Donegal Street, which will be the principal architectural feature of the church—rising to a height of 110ft.—until sufficient funds are forthcoming. The new cathedral will have a 40ft. nave. The disposition of its parts will be broader, simpler, and it will have fewer arches springing over wider spans than in a typical Gothic church.

The Basilican plan proper in this case consists of a nave 40ft. span by 120ft. in length with aisles extending to a total width of 88ft., a dome or centre choir 54ft. by 54ft., and a square chancel extending eastwards for 40ft. further, with two-storeyed aisles, in the upper part of which the organs will be placed. The whole length internally when complete will be 214ft. From each side transepts project north and south at the "crossing," each with a floor space of 40ft. square. The choir will be placed at the "crossing"—as it were among the body of the congregation, in the enclosed division known in the early Church plan as the "chorus cantorum." Appropriate stalls will be placed here for the cathedral corps of clergy. The choir for singing men and boys will be unusually spacious, accommodating seventy voices, while the transepts behind them will be convenient for a large body of assistant voices on occasions of choral festivals. The nave and its staircase turrets rise to 105ft. above the pavement, and in front of them the three great portals which come forward from the nave and aisles extend to 100ft. The great central portal of double doors is embraced in a receding series of arches, of five orders, with shafted and sculptured recessed jambs. The outer arch or order is 40ft. high and 37ft. wide, and is on the same scale as the great west portal of the Cathedral of Genoa, which is also proportionate to a great nave of 40ft. width. A sum of £70,000 will be needed to carry out the architect's whole design, inclusive of what he recommends—a central dome or tower at the crossing, giving a great belfry of the unprecedented floor space of 40ft. by 40ft. Already a gift has been promised of the finest peal of bells that can be cast, the donor being Mr. William Gibson, of Messrs. Gibson and Co., jewellers, Belfast. The plan and proportion of the church are singularly simple and arithmetical. A nave of 40ft., aisles of 20ft. width, six bays of the nave each of 20ft.; the crossing, transepts, and chancel, each within their piers, squares of 40ft.; the internal height of the aisle walls is 36ft., and of the nave and its clerestory 72ft.

For what is known as architectural "style" the architect has had to adapt his design to what seemed to him harmonious with a Basilican plan. To have imitated the Classic Renaissance manner of some Italian Basilican churches would be, in his view, to create a hall somewhat secular and unchurchlike in its associations. The later Italian churches, where a pointed Gothic style of architecture is ingrafted on a surviving Basilican plan, seemed still more incongruous and unworthy of respect. He has adopted a round-arched treatment, the main suggestion of which comes from that Byzantine source, which impressed itself on the early Church architecture that came through Italy by way of the south of France to England and Ireland. The west front will face Donegall Street. The present contract is with Messrs. Henry Laverty and Sons, of Belfast. Mr. Thomas Drew, F.R.I.B.A., President of the Royal Institute of Architects of Ireland, is responsible for the design. Mr. William H. Lynn, R.H.A., has acted as advising architect.

Correspondence.

FINISHING HALF-TIMBERED WORK.

To the Editor of The Builders' Journal.

Mansfield, Notts.

Sir,—With reference to H. E.'s answer in your issue of August 9th, it may be useful for your readers to know that there are numerous examples of rough cast, composed of lime and spar chippings, to be seen in Derbyshire, which, after standing for over two decades, still show a white and pleasing surface. I have also seen similar work in the Midland districts. This white surface is doubtless due to the somewhat smooth surface of the spar, which is cleansed by every shower of rain.—Yours, &c., ANGLICE.

HOUSE FOR MR. JULIAN STURGIS.

To the Editor of The Builders' Journal.

Dear Sir,—In your issue for August 30th is an interesting set of drawings of a house near Guildford. I am puzzled to know, however, how an ordinary-sized person could walk up the stairs, as there is only 4ft. 3in. headroom according to the drawings. Also there seems to be a serious absence of light to the lobby to bedrooms Nos. 1 and 2, which seem to be of peculiar shape. In fact, in my opinion, the house itself is the most peculiar one ever illustrated in an architectural paper. Perhaps the architect will explain.—Yours, &c., ANXIOUS.

Mr. C. F. A. Voysey, the architect of the house referred to, writes in answer as follows:—"Your correspondent should visit the 'House near Guildford,' on the Hog's Back, owned by Mr. Julian Sturgis, and he would find that there is ample room on the staircase for a 7ft. man, and a dormer window on the landing outside Nos. 1 and 2 rooms. I am very busy, and really have not time to justify every detail in my plans, which are the natural outcome of conditions."

Gifts to the London Hospital.—The work of providing increased accommodation for the nurses and patients is being rapidly pushed forward. A gift of £10,000 has been received from Mr. Edward Raphael towards the endowment of a new Jewish ward, and it has been resolved that one of the four wards designed for the new buildings should bear the name of Raphael. A gift of £60,000 had been made by the executors of the late Baroness de Stern towards the establishment of a convalescent home, and it has been resolved to buy land within easy reach of the hospital for the purpose at a cost of £10,000, the remaining £50,000 to be allocated for the maintenance of the home.

Bricks and Mortar.

APHORISM FOR THE WEEK.

"No man is born into this world whose work is not born with him; there is always work, and tools to work withal, for those who will."—JAMES RUSSELL LOWELL.

A Suggested Improvement in Paris.

A WRITER in the Paris "Figaro" makes a suggestion which ought to receive the consideration of the Minister of Fine Arts. It is that the trees in the garden at the back of Notre Dame should be removed so as to display the full view of its beautiful apse. The hideous houses which flanked the cathedral on either side have happily been removed, but this further reform is demanded, before the full glory of the marvel of stone is revealed. "Notre Dame," says the writer, "was not made to be shrouded in a virgin forest, but to be seen complete, from all sides, without obstacles, under all its aspects, of which the most admirable is now concealed. Paris can show nothing more beautiful than Notre Dame, if only she would show it instead of hiding it." The writer concludes with the facetious suggestion that if the destruction of the trees is objected to, they should be "deposed" not killed, and re-planted around the Eiffel Tower.

St. Francis's Church, Handsworth.

THE Roman Catholic Church of St. Francis, in Hunter's Road, Handsworth, has just been re-opened. Three years ago the chancel and Lady Chapel were decorated, and for the past five months the artist, Mr. Jeffrey Hopkins, of Roehampton, has been at work in completing the work then commenced. The present work has been carried out on similar lines to the former, namely, in spirit-fresco, which, when coated with a wax preparation, forms a perfectly permanent process. The work now done consists of the nave and two aisles. The chief feature of the nave is the Twelve Apostles in the spaces between the arches under the clerestory. The roof is divided into square panels, and these have been richly decorated with a cross design on a deep blue cobalt ground. The chief decoration of the aisles consists of the roofs, which are divided into three rows of panels, and these have been alternately enriched with half-figures of saints. The alternate panels are decorated with a monogram of the Blessed Virgin on the Lady Chapel side, and with the monogram "I.H.S." on the Sacred Heart side. The decoration of the aisle walls consists of a canopy design, under which the Stations of the Cross have been placed; these are very fine copies of the old masters by Beyaert, of Bruges, and the new decorations have been carefully arranged to harmonise with the rich colouring of the Stations.

The Guildhall Porch.

UNTIL recently, the walls and roof of the porch at the main entrance to the Guildhall of the Corporation of London have been wholly covered with plaster or concrete and paint, of which latter there were many coats, due to the practice of repainting on the occasion of any special function taking place at the Guildhall. The decorated bosses were also gilded and their coats-of-arms blazoned. Under the direction of the City Lands Committee, the extraneous matter has now mostly been removed and the original stonework is revealed. The state of the walls and the panelling is satisfactory, but many of the ribs of the vaulting are quite perished. The buildings about the porch are not yet two hundred years old, but the interior of the porch itself was built as far back as 1425-6. The Guildhall suffered considerably in the Great Fire, but, fortunately, parts escaped, and the porch is one of them. The interior is entirely of stone, with panelled walls, and roof vaulted in the Gothic style prevailing at the time of erection. The view now obtained is of considerable interest, and probably has not been seen hitherto by anyone now living. The appearance suggests the condition of the porch just after the Great Fire. Early in the present century the whole of the great hall and porch underwent a process of restoration, under the direction of Mr. Frederick Montague, Clerk of the City's Works, a position corresponding to that of the city surveyor to-day. The restoration consisted in covering up all defective stonework with plaster and cement in that spirit of sham-Gothic enthusiasm which ruled at the period. In 1864 this unworkmanlike "restoration" was superseded by a thorough repair of the great hall by Sir (then Mr.) Horace Jones, when the sham work was undone, and all defective masonry was renewed. The porch, till within the last few weeks, existed as it left Montague's hands (for it was not restored by Sir Horace Jones). The beauty of the porch is increased by the uncovering of the original stonework, and the old chalk vaulting is certainly worthy of preservation. It is more than probable, says the "City Press," that the City Lands Committee will report in favour of a proper renewal of the perished stone, and that the Corporation will eventually carry out the work.

Excavations at Waverley Abbey.

THE excavations that are being carried out at Waverley Abbey, near Farnham, have already been attended with much success. The Surrey Archæological Society is anxious to obtain a complete ground plan of the monastic building—an undertaking the extent of which may be gauged by the fact that the south and north walls of the "Infirmary block" have just been traced for 112ft. The foundations of the Infirmary kitchen have also been laid bare; while the idea that our ancestors always bored the trunks of trees for water-pipes is refuted by the discovery of some of the twelve-foot lengths of lead piping through which Brother Symon first supplied water to the Abbey, early in the thirteenth century. There seems to be no doubt that Waverley was the first Cistercian foundation in England. After the Dissolution it fell into ruin, and was eventually used as a quarry for the erection of the comparatively modern Georgian house hard by, which now bears the name of Waverley Abbey. The remains of Waverley Abbey are relatively so scanty that it is difficult to reconstitute it; but it is clear that its architecture was of that noble simplicity which marked the early Cistercian buildings.

Pocklington Church Restoration.

EFFORTS are being made to restore that famous Howdenshire landmark, the Parish Church of Pocklington. This church contains remnants of a Norman church built between the years 1070 and 1080. Many additions have, of course, been made to the original church. The early church, according to the researches of Dr. Alexander D. H. Leadman, of Pocklington, was without aisles, but about the end of the twelfth or early in the thirteenth century a north aisle was added (of which the arcade with its carved capitals remains), and fifty years later a southern aisle was added, and of this both the arcade and the outer wall still exist. A chapel was afterwards added on the north side of the chancel, and a hundred years later the chancel was rebuilt and a clerestory put in, whilst the west tower was also built. One or two of the old windows still remain, but most of the tracery is modern. The church, which is dedicated to All Saints, is cruciform in shape and Perpendicular in style; there are east and west transepts, with a tower at the end, the latter being the most striking external feature, with its battlements, pinnacles, and turret. For a considerable time the church has been getting into a state of disrepair that has caused much anxiety. The fabric has in many places shown signs of decay, and some time ago one of the pillars gave way at the base. To prevent a possible collapse, a beam was inserted across the nave, but in spite of this the conditions under which public worship is conducted are anything but agreeable, rain percolating through the roof in wet weather. About £8,000 are required to carry out the restoration, and about £1,500 have been already subscribed. We would impress upon the promoters of the scheme the necessity of engaging a thoroughly qualified architect to carry out the work, and leaving the restoration in his hands, for there seems to be some idea at present that the church should in part be reconstructed to its original form, and modern decoration used in place of the old.

An Architectural Visit.

ON Saturday, September 2nd, a large party of the members of the Architectural Association of Ireland visited Powerscourt House, Enniskerry, where they were received by Lord Viscount Powerscourt, K.P., who conducted them over the house and beautiful gardens, with the magnificent terraces designed by Mr. Penrose. The house is an old Georgian mansion. The architect of this mansion—the finest in Ireland from an architectural point of view—was Cassell, who flourished about 1780, and who is known chiefly as the designer of the Houses of Parliament, Leinster House, and the Dining Hall, Trinity College, Dublin, which we illustrated in a recent number. The fine collection of pictures and other art treasures, collected by the present and former Lords Powerscourt during travels in many lands, were also noticed. The members were subsequently most hospitably entertained by his Lordship.

Housing of the Working Classes.

AT a recent meeting in the Collingwood Hall, Newcastle, of a local conference of delegates from trade union branches, miners' lodges and co-operative societies, the following resolution was carried unanimously: "That this conference is of opinion that the overcrowding and bad housing conditions prevailing in many parts of the City of Newcastle, together with the high rents working men are compelled to pay as a result of the scarcity of the supply of comfortable and healthy dwellings, constitute a disgrace to the City of Newcastle; and this conference therefore respectfully urges the City Council to adopt and put into operation the clauses contained in Part III. of the Housing of the Working Classes Act, 1890, and thus increase the supply of comfortable cottages, let at fair and equitable rents. That this conference, realising the great need for housing reform, is of opinion that it is the duty of co-operators to help in this respect those least able to help themselves, and therefore urges all co-operative societies in the district to earnestly consider the possibility of safely using capital in the erection of good houses, such houses to be let to members at the lowest possible rents (consistent with a fair return upon the capital invested), and thus brought into effective competition with bad houses at exorbitant rents."

Restoration Work at Largs.

THE ceiling of the burial aisle of the Montgomeries, in the old churchyard at Largs, is in course of being restored. The work is being done for the Earl of Eglinton, who owns the aisle. This aisle and the monument which it protects are the most precious antiquarian relics in Largs. The ceiling which is being restored just now is of wood, and is divided into forty-four compartments by means of panels and mouldings. These compartments, which are of various forms and sizes, bear paintings of various subjects, among them being the signs of the Zodiac; Eve being tempted by the serpent; Jacob ploughing; Esau herding; and the old church that once stood in the churchyard. Another of the pictures has a peculiarly pathetic interest, as it shows the tragic death of the wife of Sir Robert Montgomerie, for whom the aisle was built. This lady died from the effects of a kick which she received from her horse at Largs Fair in 1624. Under the treatment to which the paintings are being subjected just now some of the colours are beginning to show up with something like their pristine freshness. More interesting still from beneath the grime of 263 years there have emerged several trees in one or two of the pictures whose presence there was not suspected. The woodwork that has escaped the damp, which for long percolated through the roof, is wonderfully fresh considering its very advanced age. The aisle is also the repository of the piscina of the ancient church found just recently.

Fireproofing at the Paris Exhibition. THERE will be an important collective exhibit at the forthcoming Paris Exhibition, representing the fire resisting materials, systems of construction, and appliances of Great Britain. The arrangement of this collective exhibit (the first of its kind) is in the hands of the British Fire Prevention Committee, to whom the Royal Commission has allotted the necessary space gratuitously, recognizing the national importance of the idea and the disinterestedness of the efforts being made by the Committee to show what the country can produce in this direction, Mr. Frederick R. Farrow, F.R.I.B.A., Chairman of the Commercial Section of the Committee has kindly undertaken the direction of this collective exhibit and it has been decided that all applications from all British and Colonial firms to be represented in this national exhibit must reach the offices of the committee by October 7th. The committee itself will exhibit a model of its testing station, specimens of reports, and the like.

The L.C.C. and the Housing Question. IN the Metropolitan Tribunal of Appeal, sitting at the Surveyors' Institution, Westminster, and composed of Mr. Cates, president, Mr. Hudson, legal adviser, and Mr. Penfold, an important appeal against a decision of the London County Council was heard last Wednesday. The appellant was Lord Llangattock, lord of the manor of Walworth. It appeared that some time ago Lord Llangattock decided, after acquiring certain leases of houses in Nursery Road, Walworth, to pull them down and on the site to build high-class dwellings for the artisan classes. He also proposed so to deal with a vacant piece of land fronting the houses at present standing in Nursery Road, and, in consideration of certain concessions under the London Building Act, he agreed to give up some land for the public use. Plans for the proposed alterations and buildings were sent to the County Council, but that body refused its sanction, and the case went to appeal. The tribunal did not then see their way to pass the plans for the original scheme, but granted an adjournment for one of a more complete and comprehensive character to be prepared. Yesterday Lord Llangattock's agents presented the plans for the new scheme, and, after statements and evidence on either side, the tribunal reversed the decision of the County Council by granting the appeal, subject to certain conditions being complied with.

The A.A. Discussion Section. THE secretaries (Messrs. R. Henry Weymouth and George H. Smith) of the Discussion Section of the Architectural Association have favoured us with the list of meetings to be held in this section during the forthcoming session of 1899-1900. On Oct. 13th a debate on "The Registration of Architects" will be opened by Messrs. A. R. Jemmett and G. A. T. Middleton; on Nov. 3rd a paper on "Brasses," by Mr. G. H. Smith; on Nov. 17th, "Tenement Houses for the Working Classes," by Mr. Robert Williams; Dec. 1st, "Church Furniture," by Mr. F. C. Eden. On Jan. 5th, 1900, a paper on "The Public Monuments of London, Architecturally considered," will be read by Mr. V. H. King; Jan. 19th, "Granite as a Building Material in the Channel Islands," by Mr. C. B. Bone; Feb. 2nd, "Opening up Land for Building Purposes," by Mr. G. M. Nicholson; Feb. 16th, "Some Aspects of Modern Architecture," by Mr. W. A. Forsyth; March 2nd, debate, "The Question of the Model By-Laws," by Messrs. J. Humphrey Jones, B.A., J. H. Tyars and F. T. W. Goldsmith; March 16th, "The Church of St. Francis, Assis," a study in colour decoration, by Mr. W. E. Dobson; March 30th, "Ventilation and Warming," by Mr. T. W. Aldwinkle, jun.; May 18th, "Some Essentials to Health," by Mr. H. C. Lander; May 25th, "The Legal Position of the Architect," by Mr. L. L. Macassey, barrister-at-law. With such a programme this Section ought to be well supported this session. The usefulness of the Section has been too little known in the past; some of these comparatively informal discussions are calculated to give more practical help to working members than the more ethereal dissertations of the general meetings. A very good feature of the meetings is the asking of practical queries previous to the business, these questions being answered by any members present who have had the needful experience.

Dorchester's Roman Amphitheatre. MR. J. J. FORSTER, in a letter to the "Times," makes an appeal to those in authority over the Roman Amphitheatre, at Dorchester, for its protection from injury. He says that until quite recently Dorchester might be said to have been contained within its "walks," avenues of trees following the lines of the old walls of "Durnovaria," and to this fact might be attributed the admirable preservation of the amphitheatre, which stood without the walls of the Roman station; but now the increase of the town has led to its spreading out and over Fordington Field, so that whole streets are now being built beyond the amphitheatre, which will soon be surrounded with houses. Herein lies the danger to which he wishes to call the earnest attention of archæologists and of Dorchester folk before it be too late. Doubtless many of the people who live in the cottages which have sprung up take a short cut across the amphitheatre in going to and from their work, thereby saving a few yards. This is a natural thing to do, but he fears it spells mutilation to "Membury Rings" (as it is locally called), for the path already made across it grows wider and wider. This Roman arena is an heirloom which should be jealously protected, for it is probably not to be matched at Silchester, or Colchester, or any other "chester" in England.

West Bridgford Wesleyan Church, Nottingham. THIS Church, of which we give an illustration by Mr. C. E. Mallows in one of our centre plates this week, has lately been erected in West Bridgford, a suburb of Nottingham on the south of the Trent. The material used in its construction is hammer dressed Coxbench stone. The church has seating accommodation for about 600. The interior woodwork throughout has been stained a bronze green, and the chancel portion has been finished with tapestry hangings from Messrs. Morris and Co., of London. The work was carefully carried out by Mr. W. Maule, Contractor, of Nottingham. Messrs. Arthur W. Brewill, F.R.I.B.A., and Basil E. Baily, of Pelham Chambers, Angel Row, Nottingham, and also of Newark-upon-Trent, are the architects.

Hailes Abbey, Gloucestershire. AN appeal is being made for funds to continue the exploration of the ruins of this attractive Cistercian Abbey. Though the church and conventual buildings had suffered most deplorably from neglect and wholesale depredation for the last three hundred years, the site deserves a complete and systematic exploration, both with a view to recovering what might remain below the accumulated soil and to preserving from further destruction that which still stands above ground. Seventeen arches survive, some belonging to the restoration of the Abbey after a fire in 1271, and therefore in bold Early English style; others dating from certain Fifteenth Century restorations, probably after another and unrecorded conflagration. The north wall of the cloister which divided it from the south aisle of the church, though "skinned," is fairly complete; while on the east side stands the door of the sacristy(?), three fine pointed arches belonging to the chapter house, the door of the slype and that of the under-croft of the monk's dormitory. On the south side are remains of the staircase leading to the latter, the Early English door of the warming-parlour, the lavatory (Perpendicular), and the great door of the refectory while on the west, where formerly stood the apartments of the Abbot and of the "Conversi," or lay brethren, stand only three arches (Perpendicular) of the inner wall of the cloister. Since 1698 the Conventual buildings have been practically deserted and became the general quarry for the neighbourhood. There is scarcely a wall or a cottage for miles round which has not in it a portion of Hailes Abbey, a tile, a jamb, a sill, or a bit of coping.

Work Already Done. NEVERTHELESS, while clearing out six feet of soil and rubbish on the site of the Chapter House, a structure 47ft. deep by 35ft., in three arcades, five out of nine grand Early English bosses sculptured with conventional foliage deeply undercut, one of which, in addition, bears the figure of Christ tearing open the jaws of a lion, which He is bestriding, have been recovered. The treatment of these figures strongly recalls the contemporary work of Giovanni Pisano. The quatre-foliate bases of the piers which carried the elaborate ribbing of the vaulting have also been uncovered *in sitû*. The preservation of these bosses is remarkable. Above them lay a thick stratum of burned timber, the *débris* of the dormitory. The cloister-garth has been cleared, and the bases of all the doors and the lavatory of the monks have been disencumbered and brought to light, during the course of which operations some two hundred tiles bearing abbatial monograms and illustrious charges have been recovered, and, above all, six beautiful heraldic bosses dating from this side of 1510, but before 1530. These bear the arms of Huddlestone, Percy, Stapleton, Compton and Evesham Abbey, and contain in themselves an entirely new chapter of the history of Hailes. In addition to these, the responds of the piers of the south aisle of the Abbey church and its high altar have been found.

Appointment of Architects. THE following report of the proceedings at the monthly meeting of the Glasgow Parish Council last week—Mr. James Brand, J.P., presiding—is of some interest as showing the opinion some public men have of architects. The minutes of last meeting stated that the committee had taken steps to acquire the necessary land upon which the new hospitals might be erected, and that the committee secure the services of a competent architect for the preparation of the plans, &c. Objection was taken to giving powers to the committee to appoint an architect. It was argued that it would be fairer to have open competition. The chairman said that whatever the minutes said, he undertook that the appointment of an architect would be submitted to the Council for it's approval. Mr. Haddow understood there should be competing plans sent in. The chairman said he never found any good result from open competitions. When the name of an architect was produced it would be time enough to make an amendment. The minutes were then adopted as correct. The minutes of the Finance Committee on the subject of office accommodation stated that the committee had unanimously appointed Messrs. Thomson and Sandilands, architects of the proposed new buildings, at a fee of 3½ per cent on the measured cost upon completion. Mr. Sadler thought the appointment of an architect for the new office buildings should be advertised. Otherwise it would not be fair. He moved an amendment accordingly. Mr. Morrin, in seconding the amendment, said that architects had their own friends. Mr. G. Ogilvie said it was a distinct understanding that the Council gave the committee full powers to appoint an architect. It would be unfortunate if the amendment were carried. Whether the Council had been misled by the motion unanimously approved and confirmed at a subsequent meeting, it would be unfair and unbusiness-like to allow the amendment to be discussed and passed. The committee were not moved by personal considerations. The chairman ruled the amendment incompetent.

Professional Practice.

Aberdeen.—The Plans Committee of the Town Council have approved the plans of the following buildings:—Seven dwelling-houses on the north side of a new street to be laid out (through the property of Hollybank), between Holburn Street and Hardgate, for Mr. A. L. Robb, builder; two dwelling-houses on the west side of Holburn Street, for Mr. William Alexander, Cluny, per Messrs. Walker and Duncan, architects; two dwelling-houses on the north side of Bedford Place, for Mr. George Fraser, agent, per Mr. William Robertson, Jasmine Terrace; dwelling-house on the west side of Gray Street, for Mr. Alexander Anderson, builder, per Messrs. Brown and Watt, architects; alterations on warehouse in connection with the North of Scotland Distillery, Hardgate, for the Daluaine-Talisker Distillery Company, Limited, per Mr. Charles C. Doig, architect, Elgin; alterations and additions in connection with premises on the west side of Charlotte Street, for Messrs. John M'Adam and Sons, contractors, per Messrs. Brown and Watt, architects; additions in connection with warehouse on the north side of John Street, for Messrs. Clegg and Thomson, iron merchants, per Mr. R. G. Wilson, architect; alterations and additions in connection with dwelling-house No. 168, Holburn Street, and workshop at rear of the dwelling-house, for Mr. S. Simpson, carpenter, per Mr. R. G. Wilson, architect The committee had also before them plan of four dwelling-houses on the south-west side of Grampion Road, for Messrs. Duncan and Stuart, builders, per Mr. Duncan Hodge, architect. The committee approved of this plan, on condition that the height of the water cisterns is to fixed by the burgh surveyor. The committee had also before them amended plan of proposed alterations and additions in connection with the premises No. 421, Union Street, for Mr. William Garvie, builder, per Mr. William E. Gauld, architect. The committee disapproved of the proposed new level of the cellar floor, and fixed the level at which this floor is to be laid. In other respects the committee approved of the plan.

Auchterarder.—Messrs. Henderson Bros., Cycle Agents, have just had new premises erected from designs, and under the supervision of Mr. W. J. Anderson, 95, Bath Street, Glasgow. The building is English Renaissance in style. It has a frontage of about 40ft., and is two storeys in height. The ground floor consists of show rooms, offices, &c. The upper floor is divided into dwelling rooms, with an entrance from a back court. The following were the contractors for the several works: Mason, Mr. Alexandar Ritchie, of Auchterarder; joiner, Mr. Alexander M'Gregor, of Blackford; slater, Mr. Robert Gibson, of Auchterarder; plumber, Mr. D. Jamieson, of Auchterarder; plasterer, Mr. M'Laren, of Auchterarder.

Christiania.—The new national theatre was opened on the first of this month by King Oscar II. Externally the building presents few features of interest. It is, however, an imposing, if somewhat heavy, structure of yellow brick with granite facings in the Italian Renaissance style, and in front, on two marble pedestals, are bronze statues of Ibsen and Bjornson. Internally the style is chiefly modified rococo. The auditorium is spacious, accommodating 1,268 spectators, well ventilated, and with admirable acoustic properties. The stage is 70ft. wide by 46ft. in depth, with an additional back portion to be used when required, 22ft. wide by 26ft. in depth. The width of the stage at the curtain is 35ft., the height 26ft., and the total height from basement to roof is 107ft. The vestibule, stairs, cloak-rooms, corridors, and foyer, are large and suitable for all requirements. The cost has been about £37,000. The exterior of the building has the blunt and somewhat dull character which, to an English eye, ruins the effect of most Norwegian architecture in brick and stone. It is, however, only fair to say that it is seen at a disadvantage just at present, and that the main façade lacks its frieze representing the death of Sigurd Favnesbane, which the sculptor, Mr. L. Utne, is preparing for it. There are also to be a group of "Culture the Conqueror" and other symbolical sculptures, all, it may be remarked, a gift from the King. The main entrance opens upon a double staircase, the steps and balustrade of which are alike of white Norwegian marble. The walls are inlaid with coloured marbles, and the ceiling, richly carved, is decorated, on a ground of gold, with flying figures painted by the artist, T. L. Wilberg. The staircase is exceptionally broad and easy of access; and, indeed, throughout the building the greatest possible care has been taken to provide against the dangers of fire and panic. At the head of the staircase corridors lead in all direction; one, which is upholstered in violet silk, conducts to the great foyer, the roof of which is a very magnificent piece of accumulated ornament, supported by a range of white marble columns, and by four life-sized caryatides, representing Drama, Comedy, Dance, and Tragedy, the whole carved by Mr. Utne. The painted ceiling is the work of Mr. Skredsvig. The walls are hung with dark-red silk brocade. The principal adornments of the foyer are a life-sized marble statue of the greatest actress Norway has produced, the late Laura Gundersen, and a colossal bust of Holberg in bronze. The former is the work of Stephan Sinding and the latter of Mathias Skeibrok, these being the two leading sculptors of the day. After the opening ceremony the King conferred on the architect, Herr Bull, the Order of St. Olaf.

Dudley. — The New Opera House was opened last week. It occupies a commanding position, with a frontage to the Birmingham Road, and is situated close to two railway stations and the termini of four tramway systems. The style of architecture is Italian Renaissance, and the material of the elevation is red brick, with terra-cotta dressings. In the oval panels occupying a prominent position in the centre of each wing of the façade are inscribed in gilt Shaksperian quotations. There is a frontage of 150ft. in breadth and 66ft. in height from the ground floor to the figure on the apex of the façade. Four double pairs of swing-doors lead to an entrance hall, similar doors to the right and left being provided for exits. The floor of the entrance hall is tesselated, and the walls have an encaustic-tiled dado and richly embossed cornice. A door from the entrance hall opens directly into the pit, and a broad open staircase with encaustic-tiled dado leads to the dress circle foyer, which overlooks the main road. The height of the interior of the theatre from the floor to the dome is 41ft., and the arrangement of the auditorium, which is capable of seating 2,000 people, consists of orchestral stalls, pit, dress circle, amphitheatre and gallery, whilst in the immediate vicinity of the stage are six private boxes, three on each side. The decorations of the interior are on an elaborate scale. The dome is supported by eight panelled buttresses with ivory-white mouldings, and the large central space of the ceiling is richly moulded. The stage will allow of the most elaborate scenic effects, the width being 72ft. 6in., the depth 36ft,, and height, from the floor line to the gridiron, 50ft.; whilst the proscenium opening is 26ft. wide. The platform round the stage from which the scenery is regulated, technically termed "the flies," is about 20ft. above the floor level, and is large and substantial. The act-drop has been executed by Mr. W. Telbin, the well-known scenic artist. The dressing-rooms are situated on the three floors of one side of the theatre, and are commodious and comfortable. There are separate refreshment bars. The building is fitted with the most modern heating appartus, and ample fire extinguishing appliances have been provided in all parts. Emergency doors are numerous, the stairs are easy of ascent and descent, and the doors have been provided with "panic-bolts." The building will be illuminated by electricity, which will be generated upon the premises, and in addition there is a complete gas installation. Nearly the whole of the work has been executed by Dudley firms. The architect was Mr. A. Ramsell; the builders were Messrs. Whittaker and Co., and the decorators Messrs. Wythes and Son; the electric installation was provided by Messrs. Whittaker Brothers, and the plastic adornments by Messrs. Dean and Co., of Birmingham. The new theatre will take the place of the old Colosseum in the Trindle Road.

Dundee.—The Victoria Street U.P. Church, has been closed during the past few weeks to allow of the interior being painted and redecorated. Messrs. P. and A. Davie, painters, Victoria Road, have, under the superintendence of Messrs. James Foggie and Sons, architects, carried out the work. Panels with beams divide the ceiling, and the former are done in a pale blue colour, with an enclosing band, into which a suitable ornament in marone is introduced. The beams are painted in a cream coloured tint. The walls are of sage green, and round the top runs a broad band in a Greek or Gothic frieze in colours, supported by lines and bands; while along the bottom is an inlaid ornament in imitation fretwork. The pulpit wall is relieved with dapier work on a dark background, with a band of gold stars, and surmounted with an imitation crown. On the pillars supporting the gallery and beams, light colours are used, while the capitals are relieved in colour and gold. Gilding has been freely introduced on the pulpit and gallery, and the whole of the woodwork has been revarnished. In the vestibule and staircase, the walls are decorated in a warm buff colour, with ornaments in olive green and brown. The hall adjoining the church, as well as the vestry and managers' rooms, have also undergone redecoration.

Greetland.—A new board school for the Greetland district, erected by the Elland-cum-Greetland School Board, was opened last week. The building, which has been erected from the designs of Mr. W. C. Williams, architect, is arranged in the form of the letter T. The long arm facing the road comprises the school for girls and boys. This contains a large room for teaching and assembling purposes, 61ft. by 24ft. 6in, with a class-room 24ft. 5in. by 22ft., entered out of the teaching-room from the centre. At each end smaller class-rooms are placed, with access from the large room at the ends. The total accommodation provided is for 266. At each end of the assembly or teaching room, and overlooking the same are teachers' rooms. The infants' school forms the central arm of the letter T, branching out from the centre of the main block. The principal infants' room measures 33ft. by 24ft. 6in., and there are two class-rooms on each side of the hall. Ample playgrounds are provided. The contractors are:—Masonry, Benjamin Akroyd, Stainland; joinery, J. E. Crowther, Elland; plumbing, J. W. Sykes; plastering and slating, Seth Collins and Sons, Stainland; heating, W. H. Jagger, Elland; painting, W. Robinson and Sons, Greetland; iron railings, A. Kitchen, Elland; asphalting, A. Kershaw, Brighouse; and furnishing, North of England Furnishing Company.

Handsworth.—New Board Schools were opened last week in the Rookery Road. The schools, which have been erected from the designs and under the superintendence of Mr. Edward Holmes, architect, of Corporation Street, provide for the accommodation of 1,060 children. The schools comprise an infants' department, consisting of central hall, five class rooms, and babies' room, and the girls' and boys' departments having five class rooms each, arranged on either side and end of a spacious central hall. There are also the usual masters' and mistress's rooms, book stores, and a detached caretaker's house. The style of the buildings is Renaissance, the details being executed in Ruabon red terra-cotta. The central halls and class rooms are dadoed with white glazed bricks, and the walls above are finished in fine plaster. The schools are thoroughly and efficiently heated and ventilated by the special Plenum system of Mr. William Key, engineer, of Glasgow, and the sanitary fittings were supplied by Sir Henry Daulton and Co. The cost of the schools, exclusive of site and furniture, is about £14,000. The builder was Mr. John Webb, Handsworth.

Hereford.—It is expected that the installation of electric light at Hereford will be ready for "switching on" by the first week in October. The building is now almost out of the builders' hands, and nearly all the cables are laid, the main work remaining being the delivery and fixing of the machinery and apparatus. The electrical works, situated in Widemarsh Street, are divided into three blocks—the boiler house, occupying the front end, and facing the street, the engine house, which is in the middle, and the battery room, which stands at the rear. The total length of the buildings is 116ft., the width 46ft., and the highest point over the engine house, 40ft. The boiler house measures 50ft. by 44ft., the engine house 30ft. by 39ft., and the battery room 30ft. by 44ft. The walls are of brick. The whole of the building is lighted by means of lanterns and skylights and iron windows, and Hope's Patent Indestructible glazing is used. In the engine room there is a dado of glazed bricks, 6ft. high, finished with a moulded capping, while above this buff-coloured bricks are used, and springing from the windows on each side are semi-circular arches. The arches and the labels, together with the top corner pieces in the front, are of Dennis' terra-cotta. The roofs are already slated, and the glazing is practically completed; the floors will be composed of granolithic in the battery house and Staffordshire blue and red quarries in the engine room. For the present two boilers will be fixed, room being left for a third when an extension of the plant becomes necessary; and there will also be two steam dynamos, with space left for another dynamo when required. The chimney, which is detached from the main building, has been completed. This stack is 95ft. high, with a diameter at the base of 12ft. and at the top of 6ft. 6in., and is of octagonal shape. At the rear of the chimney and likewise outside the main building is an economiser, the object of which is to lessen the smoke which passes up the chimney, and, at the same time to heat, the water-feeder supplying the engines. There is also close by an evaporative condenser, which is to condense the steam passing from the engines. The cables in the streets will be on the three wire system. There are several contracts in connection with the undertaking:—(1) for building the boiler, engine, and battery house; (2) for erecting the chimney stack; (3) for manufacturing and supplying the iron work; (4) for erecting the lightning conductor on the chimney, &c. The two building contracts—Nos. 1 and 2—and also that for putting up the lightning conductor were secured by Messrs. W. P. Lewis and Company, and that for the iron work, No. 3, by Messrs. Alexander and Duncan, of Leominster. The electric machinery and cables are being supplied by the India Rubber, Gutta Percha, and Telegraph Works Company, Silvertown, London. Mr. Parker, the City Surveyor, prepared the whole of plans, specifications, quantities, &c. Mr. W. Moore, one of Mr. Parker's assistants, has officiated as clerk of the works of the building. Mr. F. G. Poulton is the resident engineer.

Irvine.—Plans have been passed for the new academy. The School Board intend demolishing the present academy and erecting in its place a more modern and commodious building at a cost of £10,000. On the ground floor there will be masters' room, cloak and classrooms, central hall, lady superintendent's room, rector's room, music and reception-room, sewing-room, &c.; and on the first floor physical laboratory, classrooms, examination hall, cookery room, and laundry, cast room, elementary drawing room, laboratory, balance room, lecture theatre, preparation room, balcony, corridors, &c. To the west of the main building there is to be a range known as the gymnasium range, which will embrace a workshop, gymnasium, dressing-rooms, and playgrounds. The architect is Mr. John Armour, jun.

Newcastle.—The new Westgate Hill Board School has just been opened. It stands upon an open site at the corner of Bishop's Avenue in Westgate Road, of rather more than an acre in extent, and is planned with three stories; the ground floor being devoted to the infants, the first floor to the junior mixed department, and the upper floor to the seniors. Separate staircases are provided from the ground to the first floor, and from the ground to the upper floor, so that there may never be any crushing of the children when both floors are emptied at the same time; four staircases in all. On each floor there is a central hall, 60ft. by 30ft., having its long side filled with windows, and facing the south. Round the halls are grouped the schools and class-rooms. On the upper floor there are five class-rooms, each for sixty children, and two schools for ninety-two each, providing in all 584 places in the senior mixed department, including 100 in the central hall. On the first floor are five class-rooms, the same as above; and two schools for seventy each, the central hall holding 100; total, 540. The infants' department contains four class-rooms for sixty each; a babies' room for fifty, and the hall, 100; a total of 390. The three departments provide accommodation for 1,514 children. The desks, seats, &c., have been supplied by Messrs. Grant and Lewis, Newcastle. As the infants do not require the same amount of space given for the children upon the upper floors, covered playgrounds are provided under wings of the building, facing south. Large cloak rooms are placed on each floor, at either end of the buildings for boys and for girls. There are also private rooms for the teachers (male and female), with lavatories adjoining. These are arranged upon Mezzanine floors between each main storey. All rooms are amply lighted, and the windows are arranged so that all desks have the light upon the left hand. The whole building is warmed by a hot water apparatus, having ventilating coils, so that the fresh air is heated before entering the rooms. Each coil can be cut off at will. There are ventilators in every room, connected to two large upcast shafts, through which foul air is extracted, and arranged so as to renew the air three times in every hour. This work has been carried out by Messrs. Emley and Sons, of Newcastle. The school is built of bricks with terra-cotta dressings. The playgrounds are laid entirely with cement. A small house for the caretaker is placed near Westgate Hill. The work has been executed by Mr. Thos. Lumsden, contractor, of Jarrow, from the designs of Messrs. Dunn, Hansom, and Fenwicke, architects, of Eldon Square, Newcastle. The cost has been £24,000.

COMING EVENTS.

Monday, September 18.

Central School of Arts and Crafts, Regent Street, London, W.—Session opens.

Thursday, September 21.

Royal Institute of Public Health.—Congress at Blackpool until September 28th. Health Exhibition at Blackpool until October 14th.

Monday, September 25.

City of London College (City Polytechnic).—Michaelmas Term opens.

Thursday, September 28.

Royal Institute of Public Health.—Last day of Congress at Blackpool.

Monday, October 2.

Worshipful Company of Carpenters.—At the Carpenters' Hall, London Wall, E.C. Commencement of evening classes in building construction, drawing, and quantities. Architectural lectures at the King's College, London. Particulars can be obtained from the Secretary at the College, or from Mr. S. W. Preston at Carpenters' Hall.

Friday, October 6.

Architectural Association.—Annual general meeting. President's address and distribution of prizes. 7.30 p.m.

Monday, October 9.

Worshipful Company of Carpenters.—At the Carpenters' Hall, London Wall, E.C. Commencement of evening classes in architectural and constructional drawing, quantities, surveying, &c., and lectures on architectural construction at the University College. Particulars can be obtained from the Secretary at the College, or from Mr. S. W. Preston at Carpenters' Hall

Keystones.

A Memorial Window to Jane Austen is to be erected in Winchester Cathedral.

All Saints National Schools, Lynn, have been enlarged by the addition of new class rooms. Mr. Eagleton was the architect.

A New Workhouse at Stamford is to be erected at a cost of £23,150. Messrs. Walker and Slater, of Derby, are the contractors.

A Portrait of the Earl of Dalhousie, by Mr. John Sargent, A.R.A., was presented to the young Earl last week on the attainment of his majority.

The Fund for the Restoration of Paisley Abbey now amounts to £20,000, but to carry out the scheme in its entirety £20,000 more will be required.

A New Public School at Eaglesham is being erected on the north side of the Strathaven Road; it will accommodate 250 pupils. The cost will be £3,000.

A Home for Incurables at Harrogate is being erected from plans by Mr. T. E. Marshall, City Bank Chambers, James Street, Harrogate, at a cost of about £9,000.

The Fund for the Restoration of York Minster has now reached £13,000. As the sum required is £50,000, an urgent appeal has been made to Yorkshire to help in obtaining this.

A New Parish Church is being built at Ardross, in Ross-shire, by Mr. Perrins, proprietor of Ardross Castle, as a thankoffering for the recovery of his wife from a serious illness.

A Block of Shops and Offices are being erected at the corner of Bishopsgate Street and Middlesex Street, London, at a cost of £4,600. Messrs. Dale and Gadsdon are the architects.

The Memorial to the late Father Luke Rivington in the new Westminster Cathedral will take the form of an exact replica of the famous statue of St. Peter in his chair, which is in St. Peter's at Rome.

The New Westminster Presbyterian College at Cambridge, it is anticipated, will be opened on October 17th. The total cost of the establishment of the institution will not be much less than £40,000.

Two Stained Glass Windows have recently been unveiled in Airdrie E. U. Church. The subjects are "Christ as the good shepherd" and "Christ as the light of the world" (after Holman Hunt), and the artist is Mr. Norman M'Dougall, Glasgow.

Toplady Hall, which has been built in conjunction with the Whitfield Memorial Church, in Tottenham Court Road, and is the first of the buildings to be completed, has just been opened. The new church, it is expected, will be completed in November.

Stained Glass at Beverley Minster.—The five windows in the south front of the eastern transept of Beverley Minster have been filled with stained glass. The upper lancets illustrate the life of St. John of Beverley, and the lower ones the life of St. John the Baptist.

New Board Schools have been erected in the North Ward, Featherstone. The buildings are pleasantly situated in the midst of fields, and will accommodate 500 scholars. The cost, exclusive of furnishing, is about £3,500. Mr. W. H. Fearnley, of Featherstone, was the architect, Mr. Milson Dixon, of Ackworth, being the contractor for the whole of the work.

A Memorial at Delhi.—A project has been set on foot to obtain the necessary funds for erecting a memorial at Delhi to commemorate the services of the telegraph staff of that station on May 11th, 1857, when the members of the staff enabled the Government of the Punjaub to take steps which resulted in the saving of the province. The memorial will be an obelisk, 20ft. high, and is estimated to cost Rs. 1,500. The cost will be defrayed by voluntary subscriptions from the telegraph staff.

A New Church for "Auld Lichts" at Ayr is to be erected to contain 400 people. Mr. Allen Stevenson is the architect.

New Ponteland Bungalow.—The new cycling bungalow, erected and furnished at a cost of £1,800, at Ponteland, has just been opened.

A Memorial Chapel is to be built at Wembley, near Harrow, to contain the bodies removed from the church and burial ground of St. Mary, Moorfields.

M'Cheyne Memorial Free Church, Dundee, is being enlarged by the addition of a new suite of halls. A large organ has also been introduced into the church.

A New Presbyterian Church in Nottingham has just been erected in Mansfield Road at a cost of £4,500. The site has cost another £1,800.

Wormpit Public School was reopened last week, after its enlargement by the School Board of Forgan. The additions consist of three large class-rooms, added to the main building on the south side.

A Statue of Simon de Montfort.—An appeal is to be sent throughout the country during this and next month in the name of a most influential committee for funds to erect a statue of Simon de Montfort.

The Newport School Board proposes to erect new schools at the lower end of the town in the neighbourhood of the present Trinity Schools, and also others in the neighbourhood of the Marshes Road Schools.

The Statue of Mr. Gladstone that will be erected with the £4,500 left by the late Mr. William Roberts for the purpose, will be executed by Signor Mario Raggi, of 44, Osnaburgh Street, London, N.W.

A Competition at Bury.—The Bury Town Council have instructed the borough engineer to prepare conditions for competitive designs for a new infectious diseases hospital for Bury, to be erected at a cost of between £15,000 to £20,000.

Cottage Homes at Chester.—The Chester Board of Guardians are purchasing four plots of land at Chester for £704, upon which they will erect four dwelling houses at an estimated cost of £5,000, to be used as homes for the children of the Union.

The Memorial Portrait of the Late Mr. J. J. Colman, M.P., by Professor Herkomer, will not be unveiled in St. Andrew's Hall, Norwich, until after the Musical Festival, when the hall will be fitted up with temporary galleries, obscuring both the side walls.

The Autumn Liverpool Art Exhibition of pictures in oil and water colours and sculpture, under the auspices of the Corporation, was opened at the beginning of last week. There are altogether some 1,563 exhibits, comprising 760 oil paintings, 580 water-colour drawings, 110 pieces of sculpture, and 113 collections of miniatures on ivory, &c.

The Sanctuary of the Church of the Holy Name, Manchester, is being decorated afresh, and a number of new stained-glass windows are being inserted, the subject of which is "The Coronation of Our Blessed Lady." It is expected that the work will be finished by Rosary Sunday, when there will be special reopening services.

Causewayend Free Church, Aberdeen, has been reopened, after internal alterations and being decorated. The principal change has been the introduction of side galleries, by which means 120 additional seatings have been obtained. Messrs. D. Macandrew and Co. had the contract for the new galleries. The decorative work has been carried out by Messrs. Gordon and Watt.

Mr. Gladstone's Library.—£10,000 having been voted by the National Memorial Committee for the erection of a suitable library at Hawarden for Mr. Gladstone's collection of books, stored by himself, after months of labour, in a temporary structure near Hawarden Church, the trustees have arranged to proceed immediately with the work by accepting the tender of Messrs. Parker, of Chester.

A Free Church at Cumnock was opened last week.

The Yorkshire Archæological Society visited Skipton and Bolton Priory last Wednesday.

A Memorial Window has been placed in the east transept of Eastwood Parish Church, Pollokshaws.

The Foundation-Stone of a U.P. Church at Dalry, Galloway, was laid last week. The church will cost about £1,500.

Foundation Stones of the New Building for the Cardiff Y.M.C.A. were laid last week. The building will cost about £15,000.

New Buildings for the Runcorn Constitutional Club are to be erected on a prominent site in Greenway Road, Runcorn, from designs by Mr. Samuel Davies, M.S.A., Architect, of Runcorn and Frodsham.

New Town Hall for Batley.—The Batley Town Council are about to apply to the Local Government Board for sanction to borrow £31,500 for the erection of a new Town Hall, and £4,500 for market improvements.

The Aberdeen Free Presbytery Court has approved of the plans of a new place of worship for the congregation of the North Church, at an estimated cost of £7,800. The building will be seated for 760 persons.

The New Mission Church of St. Catherine's, West Bradford, near Clitheroe, was opened last week. The east window is of stained glass, the subject being "The Nativity," and has been executed by Messrs. Morris and Co., of London, from a design by the late Sir Edward Burne-Jones.

Find in Lincoln's Inn.—During some excavations which have recently been made in the vicinity of Lincoln's Inn Hall, in connection with drainage works, several fragments of old pottery, consisting of jars, candlesticks, a small green glass bottle, and a large bronze medal were discovered at some distance from the surface.

A New Presbyterian Church at Swindon, in Victoria Road, was opened last week. The building is in the early thirteenth century style, and cost about £6,000. It will accommodate about 900 persons on the ground floor, and there is a gallery in addition. Under the chapel schoolrooms are provided, giving accommodation for 300; there are also two large classrooms, vestry, &c.

New Council Chambers at Helensburgh are to be erected for the Row Parish Council. Mr. Robert Wemyss is the architect, and, including site, the cost will be £2,500. The accepted tenders were submitted by Mr. A. Trail, mason; Mr. John Dick, joiner; Mr. John Horn, plumber; Messrs. William Thom and Son, slaters; and Messrs. Mackay and Bryde, plasterers—all of Helensburgh.

The School Board of Glasgow have opened evening classes for elementary and advanced art and building construction at the High School of Glasgow, 30, Elmbank Street. The teachers of the art section are Messrs. William Paddock and John G. M'Kissock. The science section is under the instruction of Mr. D. Bennet Dobson, architect, assisted by Messrs. Charles Barrett and Robert B. Donald.

Improvements in Dundalk.—An inquiry was recently held in regard to the application of the Dundalk Urban District Council for sanction to borrow £17,206 for the erection of 133 artizans' dwellings, £800 for improving the Town Hall, £1,400 for purchasing the Grammar School and converting it into a free library, £650 for erecting market stalls, and £130 for the purchase of a fire escape and appliances. Opposition was raised to the first loan only.

Stratford-on-Avon Parish Church has lately been reseated, has had heating apparatus installed and alterations made to the organ, and the fabric has been repaired. The cost has been £3,415. Sir Theodore Martin has given £1,000 for the purpose of erecting a pulpit in the church in memory of his wife, the late Lady Martin (Helen Faucit). The architect, Mr. G. F. Bodley, R.A., is now preparing a design for this.

The Artists' Guild Exhibition.—Princess Christian and other members of the Royal Family will send loans to the Eleventh Artists' Guild Exhibition at the Albert Hall in November. Her Royal Highness offers prizes in the competition open to all amateurs. The section for "advanced art," under the direction of Mrs. E. M. Ward, is open to skilled artists, professional and otherwise. All kinds of artistic handicrafts can be exhibited in addition to pictorial art.

A Mission Room has just been opened in the hamlet of Newland Common, in the parish of Salwarpe, near Droitwich. The building is in the Gothic style, with lancet windows, and apse-ended east end, which serves as a chancel. It is built of red brick, with deep-red dressings, and covered with Broseley tiles. It will accommodate 150 persons. The architect is Mr. Lewis Sheppard, of Worcester, and the builder Mr. Allen Tolley, of Ladywood House, Salwarpe. The cost of the building and fittings is upwards of £300.

A New Palace at Yildiz is about to be erected for the Sultan of Turkey. It will be comparatively small and an exact copy of the Trianon. Munir Bey, the Ottoman ambassador in Paris, is purchasing a luxurious suite of furniture for it. The cost of building is estimated at about £30,000, and that of the furniture and internal decoration at £20,000. Three French electrical engineers are also engaged at Constantinople in examining the possibilities, advantages, and disadvantages of adopting the electric light for the city.

The New Catholic Cathedral at Westminster is now being roofed in. In the interior there will be a number of marble columns, which are intended to divide the chapels from the nave. The columns are thirty-four in number, and are to be 13ft. in height. The columns, which have been brought from Thessaly, were seized by the Turks among other spoils of war when they overran Thessaly two years ago. They were held by the Turks, and only given up after they had retired across the border.

St. Mark's Parish Church, Dublin, in Great Brunswick Street, erected in 1729, has just been renovated. The roof of the tower has been repaired, and the old dead wall round the church has been taken down and iron railing erected in its place. The interior of the church has been painted by Messrs. J. Gibson and Son, new windows have been placed in position, and the porches have been tiled by Messrs. Dockrell, Sons and Co., of South Great George's Street, Dublin. Funds are now required to provide a rectory, which will cost £1,000, and a new organ, which will cost £400.

The Boadicea Monument.—The pedestal is now being prepared for the reception of Mr. Hamo Thornycroft's spirited group of statuary representing Boadicea and her two daughters, of which a model was erected by the London County Council some time ago. The pedestal on which the model was placed was only 5ft. high, but the one that is now being constructed is to be 12ft. above the ground, at which elevation the group will doubtless look much more imposing than the model did. The pedestal is to be of grey granite. It is stated that the bronze casting, the work of Messrs. Singer and Co., of Frome, has cost £6,000.

Church Congress Exhibition.—The fourth Church Congress Exhibition of the Clergy and Artists' Association will be held in the studio at Leighton House (residence of the late Lord Leighton, P.R.A.), Holland Park Road, Kensington, W. The exhibition will remain open during Congress week, and will include, in addition to the examples of work executed under the auspices of the Association and by its members, representative examples of the work of individual artists and craftsmen working in churches. The famous Arab Hall and the collection of the late Lord Leighton's sketches and studies will be on view to visitors to the exhibition. The Bishop of Rochester will preside at a meeting of the Association to be held at Leighton House during the Congress week.

New Patents.

The following abridged description is specially drawn up for The Builders' Journal and Architectural Record *by Messrs. Hughes and Young, Patent Agents, 55 and 56, Chancery Lane, London, W.C., who will give advice and assistance free to our readers on all Patent matters.*

1338. Baths.—Patentee: T. W. Twyford, of Cliffe Vale Potteries, Hanley, Staffordshire. One side of the bath is made with an overhanging edge, which serves as a tray, and also to facilitate the fixing of the bath against a wall. The side is faced with wood to serve as a non-conductor of heat.

11,384. Chimney Tops.—Patentee: G. W. Taylor, of Holmes Terrace, Rawtenstall. Chimney tops are made with upper and lower double sections, having external holes opening into the annular spaces between the outer and inner pipes. The top of the lower annular space is closed over and communicates with the central freeway by holes.

1152. Bricks and Tiles. — Patentee: C. H. Collins, of Houckley Hill, Birmingham. Each brick or tile is made with a projecting rib at its lower edge and one side to protect the mortar joints from the effects of the weather. The ribs may be plain or ornamental, and the bricks or tiles may be used for walls, arches, chimneys, cooking ranges, fireplaces, lavatories, &c.

19,053. Moulding Bricks.—Patentees: C. R. Ivory, of Station Road, Teynham, Kent, and Eastwood and Co., Ltd., of Belvedere Road, Lambeth, London. A flap or striker is pivoted on a rod adjustable at one end by a bolt passing through a slotted-supporting bracket, and is held against the bricks in the moulds as the table revolves by a weight. A small quantity of water is supplied to each brick before it passes under the striker by a pipe fitted with a stop cock and a rose provided with a hinged bottom or valve normally closed by a spring; projections of the mould table strike a lever which acts on an arm of the hinged bottom.

"Architecture and Health."—Referring to the note under this heading which appeared in our last week's issue, it may be of interest to state that the firm referred to by Dr. Talbot, medical officer of health for Bow, which has secured immunity to their hands from the dreaded disease known as "phossy jaw," by their method of mixing and dipping, is R. Bell and Co., Limited, match manufacturers, Bromley-by-Bow.

The Central Police Office Buildings, Govan, have been undergoing alterations and extensions for the past year, and are well-nigh completed. The new bar is more comfortable and airy than the old, and is well fitted for the requirements of the department. A new entrance has been formed between the old and the new portion of the building, and the old one is being utilised as a private entrance to the chief constable's room. On the ground floor, immediately opposite the bar, is a large new muster hall. The new addition covers an area of 50ft. by 35ft., while the cells, which are situated to the rear of the main building, extend over 320 square yards. Each cell measures 10ft. by 7ft. by 11ft. high. The cells, which number twenty-six in all, with the addition of turnkey's pantry and casuality room, occupy two storeys. The old cells and other outhouses have been removed, and on the site there is being erected a one-storey building running from Albert Street to Broomloan Road, providing accommodation for the police stores, mortuary, tinsmith's workshop, and the lighting department.

New Companies.

C. Sands and Co., Limited.

This company was registered on Aug. 26th, by Henry Happold, 25, Wellington Street, Strand, W.C., with a capital of £1,600 in £1 shares, to acquire the business carried on at Duncan Street, Salford, as C. Sands and Co., and to carry on the business of dye, cement, varnish, blacking, and chemical manufacturers, tanners, leather merchants, &c. The first directors (to number not less than three nor more than five) are to be appointed by the subscribers. Remuneration as fixed by the company.

Wisewood Brick Company, Limited.

This company was registered on August 28th, by Waterlow and Sons, Limited, London Wall, E.C., with a capital of £3,000 in £10 shares, to carry on the business of brick, tile, pipe, and terra-cotta manufacturers, dealers in gannister, coal, sand, stone, lime, timber, &c. The first directors (to number not less than two nor more than four) are Frederick A. S. Crawshaw, Arthur T. Bescoby, Frederick U. Laycock, and William Frankish. Qualification, twenty shares.

Crapper's Brick Company, Limited.

This company was registered on Aug. 26th, by R. Fitch and Co., 42, Furnival Street, Holborn, with a capital of £5,250 in £10 shares, to acquire the business carried on by William Frankish and Marshall Nuttall, as the trustees of the will of Henry Crapper (deceased), and to carry on the business of brick, tile, and pipe manufacturers, &c. The first directors (to number not less than two nor more than five) are to be appointed by the subscribers. Qualification, £500. Remuneration as fixed by the company. Registered office, 29, York Street, Sheffield.

Ecclesall Hall Estate, Limited.

This company was registered on Aug. 26th, by Robert Fitch and Co., 42, Furnival Street, Holborn, with a capital of £20,000 in £10 shares, to acquire lands and buildings in the neighbourhood of Ecclesall, in the city of Sheffield, and in particular an estate known as the Ecclesall Hall Estate; to adopt an agreement with Edward Holmes and Robert Craig, and to carry on the business of builders, contractors, decorators, &c. The first directors (to number not less than three nor more than five) are John Hayhurst, Edward Holmes, and Robert Hunt. Qualification, £500. Remuneration as fixed by the company. Registered office, 29, York Street, Sheffield.

Digby Colliery Company, Limited.

This company was registered on August 25th, by Hind and Co., 8, Stone Buildings, E.C., with a capital of £275,000 in £1 shares, to acquire certain mines situate at Gedling, Carlton, Lambley, Arnold and elsewhere in Nottingham, upon the terms of certain agreements expressed to be made by this company with T. Potter, T. Bazley, K. Bazley, and M. E. Hardstaff; to develop and turn to account the said lands; to carry on business as colliery proprietors, coke manufacturers, coal merchants, waggon builders, iron masters, steel makers and converters, smelters, quarry owners, brick makers, engineers, gas makers, manufacturing chemists, metallurgists, and suppliers of electricity for the purposes of light, heat, motive power, or otherwise; as farmers and graziers, and to buy and sell agricultural products of every description; to turn to account any real or personal property, &c.; to search for, prospect, examine, explore, open, and work mines and land containing or supposed to contain minerals, metals, or precious stones; to seek and obtain information as to mines and mining districts, and to win, get, crush, dress, reduce, smelt, refine, and otherwise treat or prepare ore, metals, precious stones, and mineral substances of all kinds, &c. The subscribers (each one share) are: T. Bayley, The Park, Nottingham; A. C. C. Hubberty, Tollerton Hall, Nottingham; T. Potter, Daybrook House, Nottingham; E. P. Parry, Woodthorpe Grange, Nottingham; S. H. Sands, Lenton, Nottingham; C. H. Hill, Woodborough Hall, Nottingham; J. Hind, Nottingham. The first directors (of whom there shall be not less than three nor more than seven) are T. Bayley, Colonel C. C. Hubberty, C. H. Hill, E. Parry, and T. Potter. Qualification, £1,000. Remuneration, £1,000 per annum, divisible.

Thomas Briggs (Manchester), Limited.

This company was registered on August 24th, by G. Trenam, with a capital of £50,000 in £10 shares, to adopt and carry into effect an agreement expressed to be made between T. E. and R. F. Briggs and E. Neep of the one part and this company of the other part, for the acquisition of the business lately carried on by Thomas Briggs (deceased), tarpaulin merchant, manufacturer, and warehouseman, to develop and extend same, and, generally, to carry on in all or any of their respective branches the businesses of manufacturers of and dealers in tarpaulins, brattice cloth, paper, waterproof paper, and packing materials; and as canvas manufacturers, dealers in oil, pitch, sizes, varnishes and other materials for application to textile fabrics, sacks, bags, covers, sails, and other articles made from hemp, jute, flax, cotton, &c.; as weavers, cotton spinners, &c.; to deal in and manufacture every description of plant, machinery, apparatus, tools, utensils, commodities, articles and things necessary or useful for carrying on any of the above businesses; as spinners, dyers, doublers, combers, bleachers, finishers, &c.; to acquire and turn to account any patents, patent rights, and inventions, &c.; to acquire any mines, mining, water, and other rights, grants, leases, claims, concessions, options of purchase, alluvial ground, mineral deposits, &c., in any part of the world, and to carry on the business of a mining, milling, smelting, and trading company in all its branches; to lay out towns and villages; and to construct, maintain, and work rail and tram roads, wharves, docks, piers, warehouses, jetties, canals, &c. The signatories (each one share) are: T. E. Briggs, Dunham Massey, Cheshire; R. F. Miller, Manchester; E. Neep, 77a, Lord Street, Liverpool; F. Pownal, 32, Albert Road, Whalley Range; E. Webb, 250, Great Clowes Street, Manchester; W. P. Morison, 103, Gatley Road, Cheadle; G. McL. Doig, 25, Birch Lane, Longsight, Manchester. The first directors (of whom there shall be not less than three nor more than five) are T. E. Briggs, E. Webb, W. P. Morison, R. F. Miller, and E. Neep. Qualification, £100. Remuneration: T. E. Briggs, £800; E. Webb, £750; W. P. Morison, £500; R. F. Miller, £100; E. Neep, £100. Subsequent directors' remuneration to be fixed by the company.

Improvement Scheme at Blackburn.—Having abandoned their intention to enlarge their present town hall by taking in part of the market ground, the Blackburn Corporation have ordered the preparation of plans and estimates for the erection, near the fine new Technical School, of a great block of buildings, comprising large assembly hall, police courts, police station, and central fire station. This plan involves the widening of the ancient highway of Northgate to 60ft., and the sweeping away of several streets of poor property in the centre of the town.

The Congress of the Royal Institute of Public Health will be held in Blackpool from September 21st to 28th. The Marquis of Lorne will deliver his presidential address on Thursday, the 21st inst., at 11.30 a.m. Meetings will be held in four sections, these being (*a*) preventive medicine and vital statistics, (*b*) chemistry and meteorology, (*c*) engineering and building construction, and (*d*) municipal and parliamentary section. Conferences will also be held for medical officers of health, for veterinarians, for sanitary inspectors, and of ladies on domestic hygiene. The Health Exhibition of the Congress will open with the Congress, but will not close until October 14th. Excursions have also been arranged.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work. An asterisk (*) signifies accepted.

BASINGSTOKE.—For the erection of the Isolation Hospital, Basingstoke, for the Urban District Council. Mr. James Gibson, architect, Basingstoke. Quantities by the architect:—

Martin, Wells, and Co.	£6,100 0	Musselwhite & Son	£5,689 0
J. Thumwood... ...	5,769 14	Bottrill and Son ..	5,578 0
		Mc.Carthy E. Fitt*	5,555 0

BLACKBURN.—Accepted for the erection of store premises, for the Brewery Company, Limited. Mr. J. Bertwistle, architect, Tackett's-street, Blackburn. Quantities by the architect:—

Builders' Work.

John Boland, Whalley New-road, Blackburn ... £542

Fireproof Work.

The Phœnix Fireproof Company, Ardwick, Manchester £791

ENFIELD.—For the construction of underground convenience, Market-place, Enfield Town, for the Urban District Council. Mr. Richard Collins, surveyor, Council Offices, Enfield:—

Fleming and Co.... ...	£1,190	Finch and Co.	£650
Bolding and Sons ...	1,140	E. J. Betts, Enfield Highway*	595
Doulton and Co.	685		

FARNHAM.—For re-erection of "The Grenadier" public-house, Heath End, Farnham, for the Army and Navy Co-operative Breweries. Messrs. Friend and Lloyd, architects, Aldershot:—

Martin, Wells, and Co.	£1,320 0	S. W. Gibbs...	£785 10
J. W. Gunstone ...	952 10	F. Knight	755 0
		W. L. Edgoose	715 0

GRAYS.—For alterations and additions to the Grays Co-operative Industrial and Provident Society, Limited, Grays, Essex. Mr. Christopher M. Shiner, architect, 3, Bond-court, Walbrook, E.C.:—

F. and E. Davey... ...	£5,230	Sims and Woods	£3,380
Wm. Potter	3,600	J. J. Lawrence	3,125

HALIFAX.—Accepted for the erection of school and house, Southowram Bank. Mr. J. F. Walsh, architect, Lancashire and Yorkshire Bank-chambers, Halifax:—

Mason.—Adam Foster	£808 0 0
Concretor.—L. Lister, Hipperholme ...	63 10 0
Slater.—L. Lister, Hipperholme	97 0 0
Plasterer.—L. Lister, Hipperholme ...	64 15 0

Heaters.—Fawley and Sons, Halifax ...	66 0 0

HARTLEY WINTNEY (Hants).—Accepted for the execution of sewage filtration works, for the Hartley Wintney Rural District Council. Messrs. Fairbank and Son, engineers, 13, Lendal, York. Quantities by engineers:—

Thomas Bell, Market Weighton, York ... £2,079 4 8

HERNE BAY.—For the erection of the Passmore Edwards' convalescent home for railway men for the trustees. Mr. A. Saxon Snell, architect. Quantities by Mr. Bernard Swinstead:—

W. Downs...	£9,890 0	Peacock Bros.... ...	£8,608 0
Parramore	9,741 0	J. Carmichael... ...	8,544 0
W. J. Adcock	9,205 18	Spencer, Santo, and Co.	8,504 0
Denne and Son ...	9,200 0	Wall and Co., Kentish Town*	8,367 0
T. G. Sharpington	9,059 0		
W. W. Martin.. ...	8,934 0		

LONDON.—For additions to London and County Bank, Harrow-road, Paddington, W. Mr. Thomas Dinwiddy, architect, 54, Parliament-street and Greenwich:—

F. T. Chinchen	£2,594	W. Mills*...	£2,449
Ransom and Co.... ...	2,510		

LONDON.—For new London and County Bank branch and business premises at East Greenwich. Mr. T. Norman Dinwiddy, architect, 54, Parliament-street and Greenwich:—

J. and A. Oldman ...	£3,166	W. Mills	£3,065
Jones and Groves ...	3,155		

LONDON, S.E.—For the erection of thirty-eight working class dwellings, Lanford-street, Woodpecker-road, Deptford, S.E., for the Surrey Commercial Docks Co. Messrs. Humphreys, Davies, and Co., architects:—

Foster and Dicksee ...	£29,992	Perry and Co.	26,974
Wallis and Slater ...	29,644	Holliday and Greenwood	26,949
Howell J. Williams ...	28,250	Kirk and Randall* ...	26,833
Holloway Bros.	27,918	Killby and Gayford ...	26,820
Wallis and Sons... ...	27,827		
Smith and Sons	27,491		

TARVIN (Cheshire).—Accepted for the construction of waterworks, for the District Council. Mr. H. B. Killon, C.E., 22, Cooper-street, Manchester:—

Contract No. 1.

C. John Nevitt, Bailey-street, Stafford ... £3,174 8 5

Contract No. 2.

C. John Nevitt, Bailey-street, Stafford ... 1,154 18 6

CONTRACTS OPEN.

EAST SUSSEX COUNTY COUNCIL.
TO BUILDERS.

TENDERS are invited for the proposed ALTERATION and EXTENSION of the COUNTY HALL, Lewes.

Plans, specifications, and conditions of contract may be seen at the County Surveyor's Office, Lewes, between the hours of TEN a.m. and FOUR p.m.; SATURDAYS ONE p.m.

Quantities may be obtained on application to Mr F. J. WOOD, County Surveyor, County Hall, Lewes, on payment of a deposit of Three Guineas, which deposit will be returned on receipt of a bonâ-fide Tender.

Tenders, endorsed "Tender for County Hall Extension," to be addressed to the undersigned and delivered not later than TUESDAY, OCTOBER 3rd, 1899.

The County Council does not bind itself to accept the lowest or any Tender, or to pay any expenses in connection with the preparation thereof.

F. MERRIFIELD,
Clerk to the County Council.

County Hall, Lewes,
September, 1899.

THE VESTRY of the PARISH of ST. MARY, BATTERSEA.
ELECTRIC GENERATING STATION AND WORKS.

The Vestry are prepared to receive TENDERS for IRON and STEELWORK required for the above, to specifications as follows:—

No. 1. Cast-iron Stanchions, Columns, Cantilevers, Chimney Cap.
No. 2. Wrought-iron Floor Plates with Hoppers and Stayrods, and Chequered Plates with Cast-iron Bearers.
No. 3. Wrought-iron Doors and Windows.
No. 4. Steel Girders, Joists, Bolts, &c.
No. 5. Roofs over Engine Room and Boiler House.

Specifications and forms of Tender and contract can be obtained, and the drawings inspected, upon application at the Municipal-buildings, Lavender Hill, S.W., between the hours of TEN a.m. and FOUR p.m. (Saturdays TEN a.m. to TWELVE noon).

Tenders, sealed, and marked on the outside "Electric Generating Station and Works—Tender for——," must be addressed to the undersigned, and delivered at the Municipal-buildings not later than TWELVE o'clock noon on WEDNESDAY, SEPTEMBER 20th, 1899.

The contract will be prepared by, and at the expense of, the Vestry.

Persons tendering will be required to declare in their Tender that they pay the Trade Union rate of wages, &c., and must append to the Tender a schedule of the wages paid to the various classes of workmen employed by them at the time of tendering.

The Vestry do not bind themselves to accept the lowest or any Tender.

By order of the Vestry,
W. MARCUS WILKINS,
Vestry Clerk.

Municipal Buildings,
Lavender Hill,
September, 1899.

METHODS OF PILING FOUNDATIONS.

By G. ELLIS.

(Concluded from page xxvi., No. CCXXXVIII.)

FIGS. 9 and 10 are respectively a sectional elevation and plan of the timbering employed when the bad soil is of great depth. It consists of a triple row of piles driven under the site of each wall at about 3ft. centres, and these may vary in length from 12ft. to 25ft. according to the load. The heads of the piles, after levelling, are connected, as in the former case, by stout balk sleepers, notched and spiked to them. These sleepers are half-notched over each other at the return or angles; on top of these are laid two sets of stout elm planks, grid fashion, and the whole of the timber work, to a depth of 6in. below the sleepers is embedded in concrete. Elm is the most lasting wood to employ in these circumstances, but it is very difficult to get sufficiently straight-grained for piles, and when cut across the fibres it frequently shivers under the ram. Formerly oak and beech were much used for that purpose, but more recently the Australian woods, Karri-Karri, Jarrah, and Blue-gum have been employed with good results.

The afore-mentioned methods of forming foundations are not safely applicable when the structure to be raised is of very great weight, and rivers or deep cuttings that might at times drain the surrounding soil are within short distances of the site. In such cases piers of brickwork or masonry must be raised from the hard bottom, through the soft strata, to act as abutments to arches, or supports for girders, and they must be of sufficient strength to carry the superstructure.

There are three usual methods of sinking shafts for the purpose of building these piers: (1st) A timber lined or "cleaded shaft," (2nd) an under-pinned brick shaft, (3rd) iron cylinders sunk in sections. The last named, when the firm ground is reached, are usually filled up solid with concrete and themselves form an integral part of the pier. They are most usefully employed when the soil is too wet to allow of the other two methods being successfully employed. A timbered shaft is used when the soil to be pierced is tolerably dry, but loose and treacherous. It is kept as small as possible for the sake of economy, and is usually rectangular in plan, the longer section running in the direction of the wall. The reason of this is that there is no need to make the shaft wider than to give the bricklayer foot room on each side of the footings, but extra length is required for the excavators to have a "throw" for the core, which is passed upwards in stages. A very usual size is 4ft. by 6ft. The thickness of the lining, technically "cleadings," and of the supporting framework—the "settings"—depends upon the character of the soil and the depth of the sinking. It is usual to double the thickness of the cleading after a depth of 30ft. is reached, and to reduce the distance between the settings. In dry clays 1in. to 1½in. cleadings and 4in. by 4in. settings may be used. In quicksands 3in. to 4in. cleading and 7in. to 9in. square settings will be required.

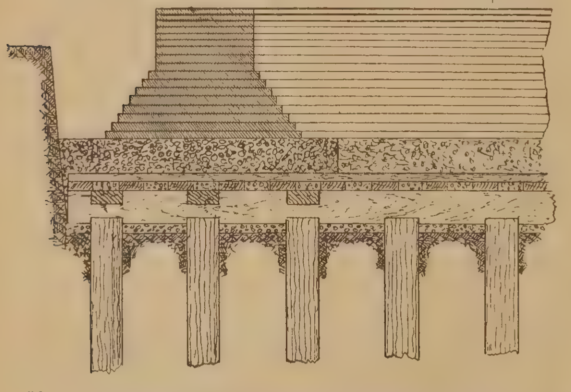

Fig. 9.—SECTIONAL ELEVATION OF FRICTION PILES.

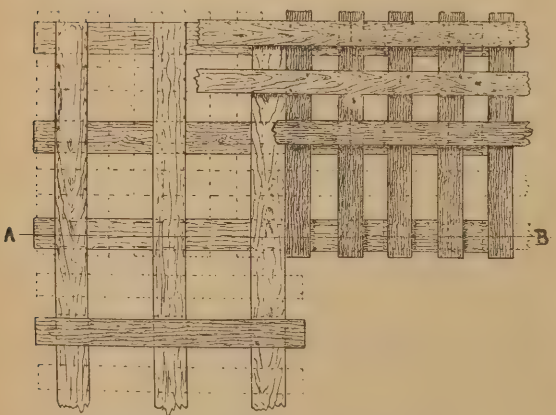

Fig. 10.—PLAN OF FRICTION PILES.

The method of making the shaft is to take out 3ft. or 4ft. of ground to the size required, then line the two long sides with cleading, driving the boards down into the bottom a short depth to make them stand. The boards average 4ft. in length, but the first set should be longer so as to project from the ground as a protection to the mouth of the shaft. Two setting pieces are strutted across the face of the boards at the ground level, then the two ends are lined similarly, and the end settings are cut tight in between the sides and driven home hard on the boards; they are fixed in this position by stout cleats spiked on the face of the side settings. Another "lift" of core is then taken out, and a second series of cleading and setting inserted, the upper ends of this set overlapping by some 6in., the lower ends of the first, the setting frame thus nipping the two sets (see section, Fig. 12). This process is repeated until the firm ground is reached, the frames being ranged in bays of from 3ft. to 6ft. apart, and kept in position by stout props at each corner, running from frame to frame throughout the depth.

When the shaft has been sunk about 12ft. there is considerable danger of the whole thing slipping down the shaft through the weight of the material; it then becomes necessary to throw two balks across the opening, and bolt long planks to them, reaching to the bottom of the shaft. These planks are spiked to the settings and effectually prevent any settlement; longer ones are of course substituted as the depth increases: the bottom setting being strutted from below whilst the change is executed. Fig. 11 is a plan, and Fig. 12 a vertical section of a timbered shaft.

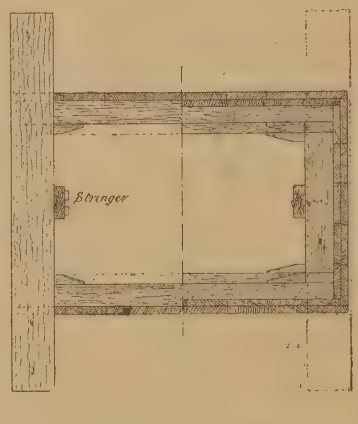

Fig. 11.—PLAN OF TIMBERING FOR A SHAFT.

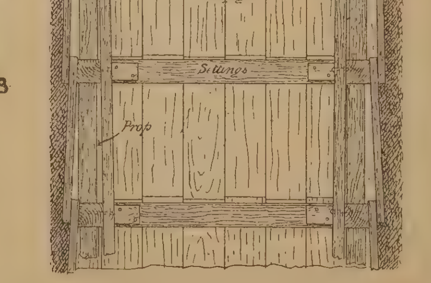

Fig. 12.—VERTICAL SECTION OF TIMBERING FOR A SHAFT.

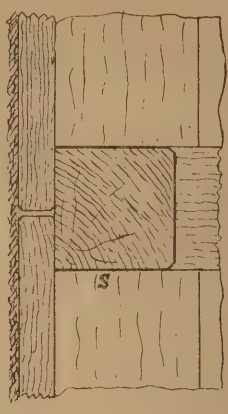

Fig. 13.—ALTERNATIVE METHOD OF INSERTING CLEADING.

In Fig. 13 an alternative method of arranging the cleading is shown. In this case the frame is laid down first at the bottom of the first "lift" of earth, and the boards are driven down behind the frame to a depth of half its thickness; the frame is then tightened up with wedges, which are cut off flush, and the cleats are nailed over them; when the next lift has been got out the second set of cleadings is worked up behind the top frame, as shown in the illustration, until they butt against the first set, and so on. This method gives more room in the "working," but takes much longer to execute and is not so satisfactory, for if the boards are of unequal thickness the thinner ones will slip out. Brick shafts are sunk through soils containing much water; timber shafts would allow the water to percolate into the excavation and fill it, but brick shafts, built in quick setting cement, form an impervious lining to the shaft as it advances.

The method followed, with slight variations according to circumstances, is to prepare several curbs, of 6in. elm, of an outside diameter equal to the size of the proposed shaft. These curbs are made in segments of 2ft. or 3ft. long, lap jointed, and generally straight on the inside; an excavation is made slightly larger than the curb, and of as great a depth as the nature of the soil will allow; then the curb, sent down in segments, is spiked together at the bottom, and laid round the shaft, carefully levelled, and the brick lining commenced on it, the bricks being laid in half-brick rings, breaking joint. This is carried up to the top of the shaft; then the excavators take out the centre core, leaving the ring of earth under the curb. When they have gone as deep as is considered safe, a stout sole piece is bedded in the centre of the bottom; and raking struts are taken from it up to the underside of the curb, three being usually thought sufficient. When these are wedged up firm, the supporting earth is taken out, another curb is laid at the bottom, and the brickwork is built up from it to the underside of the upper curb. This process is repeated until the requisite depth is reached, when the shaft is filled in with brickwork or concrete.

THE SANITARY INSTITUTE.

CONGRESS AND HEALTH EXHIBITION.

[By Our Special Correspondent.]

(Continued from page xxxv., No. CCXXXIX.)

A BRIEF ACCOUNT of the Health Exhibition, which formed an important feature of the recent Sanitary Congress at Southampton, was given in our last week's issue. We resume this week our review of some of the more notable exhibits.

The entrance porch of the exhibition was erected entirely by the Mack Patent Fire and Sound Proof Slab Company. This firm had also a good exhibit in the great hall, consisting of various kinds of fire and sound proof partitions, floors, ceilings, roofs, &c., specially adapted for hospitals, schools, drying rooms, and other large establishments. They claim a great saving of time by their process. The wall slabs are made with an asbestos backing and are used instead of the ordinary mode of plastering walls. Another excellent variety was their tiles embedded in slabs, which appeared cleanly and easily adapted to any house. We understand that this firm, which, by the way, was awarded a bronze medal, has entirely fitted up the German Emperor's palace at Stutgart, and also the municipal offices for the Paris Exhibition next year, the whole 900ft. frontage being entirely fitted with these slabs.

Messrs. Oates and Green Limited, Halifax, who by the way obtained the silver medal (the highest award) at the Lincoln Exhibition a few weeks ago, had two excellent stands here. Among other things, we noted a triple taper urinal range in salt glaze as supplied to Windsor Castle. A sanitary manger with improved fastening. This latter obtained a bronze medal. Here also was a range of three latrines with each pan trapped and automatically flushed. It is only fair to say here that Messrs. Oates and Green had several of their latrines broken in transit, otherwise it was their intention to show a range of six latrines. Had they thus shown we have no hesitation in saying they would have obtained an award. We will watch the result of this exhibit at the next show. Down stairs this firm had fitted up a sanitary cowshed, which was occupied by cows belonging to the Model Dairy. This shed had salt glazed trough and manger, with a continuous flow of clean water through the drinking trough, the floor was laid with blue bricks. This exhibit was well worthy of the judge's notice.

The International Purification Syndicate had an interesting exhibit in a working model of the Southwold oxidising bacterial filter, showing actual thickness of bed and method of uniformly and intermittently distributing the anærobic effluent from the sludge peptonising bed by means of the Candy-Earnh Sprinkler. This system of Polarite oxidation for the treatment of sewage appears to be most satisfactory in that the cost is considerably less than any other system, it does away with the use of chemicals, and the space required is a great deal less than is ordinarily required for a sewage works. Here also was shown a full-size intermitter for 100,000 gallons flow, discharging every few minutes according to rate of flow. This intermitter is for resting and working filter beds from a channel; the only alteration needed being variation in the size of the bottom valve to suit the quantity of sewage to be purified. The whole thing is perfectly simple with no complicated parts. This is evidently a great advance in the bacterial treatment of sewage, a question that at present is troubling many local councils. Dr. Griffiths, F.R.S., F.C.S., reported that sewage passed through the Polarite oxidising bed was ninety-seven times purer than the effluent from an open septic tank, and that it contained no ptomaines at all. Public health officers should give the attention to this system that it undoubtedly deserves.

The Hard York Stone Company, whose stand was in the central hall, had laid down a short footpath, about 12ft. long, of their non-slip flags. In appearance they resemble ordinary York stone, but the makers claim that they are of greater durability, as they are made from the noted Silex York stone, a natural product obtained from the lowest beds in the county, and the very best stone of its class, its crushing strain being 2,200 tons per cubic foot. A peculiar feature of this stone is its inability to become slippery like granite or other similar stones. Another feature of the hard York stone, which ordinary York stone lacks, is its perfect freedom from laminations which are inseparable from the latter. It is evident that the stone is becoming popular by the fact that civil engineers, municipal authorities, and others who have adopted it speak most highly as to the result, it being cheaper than natural stone, yet having all the advantages of the manufactured stone.

Messrs. J. L. Wade & Co. were exhibiting their Patent Automatic Disinfector, a remarkably simple and easily adapted machine, most suitable for cisterns, water-closets, &c. The particular claims made for the Disinfector are as follows:—(1) It flushes, deodorises, and disinfects by one and the same operation, affording the means of preventing in urinals and w.c.'s the disagreeable odour arising from the slimy deposit known as "furring." (2) It acts automatically. (3) The simplicity of its mechanism renders it free from liability to get out of order. (4) It fits any flush tank or cistern. (5) It lasts from one to three years, during which time it requires no attention. (6) It is very economical, as it can be recharged with the disinfectant at a cost of from one to two shillings. Messrs. Wade also had several of their well-known disinfectant powders and their sulphur candles. This well-known firm are large contractors to the different Government boards.

The Frode Company, Limited, had their preparations on view for cleansing painted and varnished buildings, rooms, &c. This, to our mind, is not only a cheap but a most effective and clean process for cleansing houses, walls, &c. It is used on many of our principal railways, notably the L.B. and S.C. Railway, the District Railway, the North-Eastern, and others. The Allan Line of steamers, which carries passengers out and brings cattle home, has, after many trials, finally adopted "Froda" for the purpose of cleaning and washing the paint and woodwork of the ships on their return to Liverpool, and has found it most satisfactory in results.

C. W. Outram & Co., Woodville. This new firm, whom we do not remember to have seen in previous exhibitions, had a very good display, and we were pleased to see that the judges considered the "Aquarius" closet on exhibition by this firm worthy of a bronze medal. They also had a patent water waste preventer, which answered admirably the purpose claimed for it.

The Albion Clay Co., Ltd., had a large and varied show of their various specialities, notably the Syke's Patent Screw Joint Pipes, Syke's Patent Interceptor Street Gullies, and Sankey's Patent Gulley.

The Sanitary Lead Lining Co. were to the fore with their admirable process, which created much interest amongst the many visitors interested in the allied trades. This company has a great future before it.

Messrs. Major & Co., Limited, Hull, were showing their new disinfectant "Encryl," which seems to be catching on, not only in general public works, but also in the bath room, where their toilet preparations are becoming popular.

Messrs. Burt, Boulton and Haywood had an interesting exhibit showing the process of creosoting timber paving blocks; also a model of a rapid mixer for breweries, chemical sewage, and other works.

The following is a full list of awards:—

Silver Medals.—Brown and Polson, London, E.C., for corn flour for invalids; Burroughs, Wellcome, and Co., London, E.C., for disinfecting soloids; Burt, Boulton, and Haywood, London, E.C., for products of coal tar and ammoniacal liquor; Cadbury Bros., Bournville, near Birmingham, for cocoa; F. C. Calvert and Co., Manchester, for carbolic acid preparations; Chalmers and Co., Red Hill, for van-shaped ambulance; J. Defries and Sons, Limited, London, E.C., for Equifex steam disinfector; W. Glover and Sons, Limited, Warwick, for Glover's tipping dust van; United Alkali Co., Limited, Liverpool, for chloros; Webb's Engineering Co., Limited, London, E.C., for anti-splash excel silver nozzles; and Wilson and Stockall, Bury, Lancs., for brougham ambulance.

Bronze Medals.—Aerators Limited, London, E.C., for Sparklets; Robert Adams (four medals), London, S.E., for the "Crown Victor" and "London Victor" oil check spring hinges, the "City" and "Cushion Victor" pneumatic silent check spring hinges, the "E. R. A." reversible window fittings, and "X. I. T." bolts; Albion Clay Company, Limited (three medals), Woodville, Burton-on-Trent, for Sykes' access pipes and junctions, Sykes' street gully, and "Accomo" yard gully; Alione Company, Norwood, S.E., for sick room apparel; Anderson Patent Pipe Coupling Syndicate, London, W.C., for Anderson's pipe coupling; Boake, Roberts, and Co., Stratford, E., for liquid sulphur dioxide; Joseph Cliff and Sons (four medals), London, S.E., for Shoppee's dove-tailed bricks, Shepwood partition bricks, Wyvurst's channels, and Borders's glazed stoneware manholes; Doulton and Co. Limited (two medals), Lambeth, S.E., for "Compact" washdown closet, and vitreous porcelain enamelled bath; J. Duckett and Sons, Limited (three medals), Burnley, Lancs., for latrine with isolated pans, "Clencher" wash-down closet, and the "Rapid" slop water closet; the Hard York Patent Stone Co., Light Cliffe, near Halifax, for the "Non-slip" hard York stone; Herbert James Holt (two medals), Bevois Valley, Southampton, for Cullis and Beavan's combined sink standard and waste, and Ewart's geyser; Hooper and Ashby (two medals), Southampton, for Callender's pure bitumen, for linings, and Barron's channel bends; Geo. Howson and Sons, Limited (three medals), Hanley, for white enamelled fireclay wash tubs, combination fireclay sink with wash board, and range of white enamelled urinals; George Jennings (three medals), Lambeth, S.E., for "Era" valve closet, white glazed Dorset clay channels, and porcelain bath with duplex supply valves; J. A. King and Co., London, E., for the "Mack" patent fireproof plaster slabs; B. Kühn, London, E.C., for chinosol; Lockerbie and Wilkinson, Limited, Birmingham, for abattoir fittings; Oates and Green, Limited (two medals), Halifax, for salt-glazed wash tub and rubber combined, and improved glazed stoneware manger; C. W. Outram and Co., Woodville, Burton-on-Trent, for aquarius water closet and fittings; Parke, Davis, and Co., London, W., for anti-diphtheria serum of high potency; T. E. Peckett, Sheffield, for combined knife and fork cleaner; G. A. Permain and Co., Southampton, for inlaid linoleum; Sanitary Lead Lining and Pipe Bending Company, Chelsea, S.W., for lead-lined iron pipes; W. Summerscales and Son, Limited (three medals), Keighley, Yorks, for washing machine for disinfecting under steam pressure, improved "Challenge" ironing machine, and "Body" ironing machine; and R. J. and H. Wilder, Wallingford, Berks, for Wilder's spring tumbler cart.

Selected for Practical Trial.—Anti-Vibration Incandescent Lighting Company, Bradford, for anti-vibration fittings; H. Barrand, Halifax, for cascade filter for removing lead from water; Brand and Co., Limited, London, S.W., for nutrient powder; J. Cliff and Sons, London, S.E., for architectural terra-cotta; The English Paintoff Company, London, S.W., for paint removing compound; The Esywosh Company, Limited, Plymouth, for "Mabin-Pett" improved perforated fire bar; Formalin Hygienic Company, Limited, London, E.C., for alformant "B" and Trillat's autoclave; T. G. Lyon, M.A., M.D., London, S.W., for Lyon-Cadet ventilating apparatus; Parke, Davis and Co., London, W., for beef meal; Alice Patchett, Birmingham, for mortar testing apparatus; G. A. Permain and Co., Southampton, for kapok vegetable wool for mattresses; Reeves' Chemical Sanitation Company, Limited, London, W., for system of sewer deodorisation; H. Rossell and Company, Limited, Sheffield, for automatic smoke preventer; Walter Sharratt, Clayton, Manchester, for formaldehyde regenerator; Sissons Brothers and Company, Limited, Hull, for Hall's sanitary washable distemper; Ernest Smith, London, S.E., for Smith's iron-jointed stoneware pipe; C. J. Van Houten and Son, London, E.C., for cocoa; and Webb's Engineering Company, 11, Poultry, E., sewer gas extractor.

Letter of Recognition.—Southampton Corporation, for sections and systems of sewers.

(*To be continued.*)

Masters and Men.

The Bristol Deal Runners' Dispute.—At Bristol the strike of four hundred deal runners terminated last week by the merchants giving the men the option of accepting threepence a day extra, or half an hour less work, instead of an advance of wages. The men accepted the advance, but get three hours' less work on Saturday.

The Labourers' Strike at Leicester.—The master builders of Leicester having, after a twenty weeks' strike of the labourers for an advance of a halfpenny per hour in wages, agreed to refer the dispute to arbitration, the men on strike have passed a resolution in favour of such a course. The matter will now be referred to the men not on strike, who at non-federated shops are in receipt of 6½d. per hour.

Settlement of the Danish Lock-Out.—The Builders' Carpenters' Union, which does not belong to the Trade Union Alliance and consequently has taken no part in the recent negotiations, having given its adhesion to the terms of the agreement for the termination of the great lock-out, the latter was finally signed by representatives of employers and men last week. Work was resumed last Thursday. The conflict, so far as we understand the position, has ended in the resumption of work on the basis of a compromise. The conflict involved 35,000 men.

The Manchester Plasterers' Labourers Dispute.—The dispute between the plasterers' labourers of Manchester and their employers, which has lasted since last March, was settled at a joint conference last week. The demand of the workmen was for a halfpenny an hour advance, and the employers at the last conference offered a farthing an hour at once and another farthing in six months. This offer was refused, but in the meantime the operatives decided to accept it, and a final agreement was come to on the terms suggested by the employers. The operative plasterers have obtained an advance of a halfpenny per hour at once and another halfpenny in six months.

The Building Dispute.—In Leeds some time ago the London Order of Bricklayers made a demand for an advance of a penny per hour. The representatives of the Employers' Federation, in conference with the men, agreed to concede a halfpenny, but on a vote of the whole of the federated employers being taken, a large majority stood out against the proposal. The position thus arrived at was complicated by the fact that the Manchester Order of Bricklayers had taken no part in the demand for an advance. Now, however, an effort is being made to bring the two societies of workmen into agreement, with a view to their entering upon joint action in the matter. The master builders of Hull had an important conference last Wednesday with representatives of the operatives, with the object of settling the conditions upon which to terminate the present lock-out in the building trade of the city. The meeting lasted four hours, the most important point discussed being the working of Union with non-Union operatives at present in the masters' employ. The employers declined to discharge these men, and the Unionists absolutely refused to return to work unless they were discharged. A suggestion was made by the masters that the men should work with non-Unionists, and that all hands wanted in future should be obtained from the operatives' association. This suggestion was discussed, and ultimately it was decided to take the feeling of the operatives' respective societies. The meeting was adjourned till to-day. Judging by the present temper of the men there is little or no prospect of the employers' suggestion being accepted.

Cwmbran Brickmakers' Strike.—At the Cymbran Petty Sessions last week the magistrates had before them the case of three brickmakers employed by the Cwmbran Brick Company, who struck work without giving a week's notice. The men's names were George Dean, James Richardson, and David Watkins, and they were employed as fillers of clay. As a consequence of their absenting themselves the works, which employ forty men and boys, were stopped for three days, and the company claimed 40s. from each as damages, but really, according to the managing director, they lost £10 or £12. The defendants received 5d. per hour, and were paid weekly, the wages amounting to 23s. 6d., and they left after making two applications for an increase of wages, which were both declined. The rule of the works was a week's notice, and the men had been employed there two years. The magistrates decided that the men must pay the 40s. each which the company claimed, and the Court costs, 5s. 6d. each; in default of a distress, fourteen days' imprisonment.

Wages and Working Hours in Glasgow.—The Corporation of Glasgow have adopted the following minutes of the Statute Labour Committee, with regard to the working conditions of their employés:—The Sub-Committee unanimously agreed to recommend (1) that the wages of the masons' labourers, which at present are at the rate of 23s. 9d. per week, be increased to 25s. per week for the nine months of the year during which they work fifty-seven hours per week, and to 24s. per week during the three winter months, when the working hours are only fifty-one per week, and when they are paid for time not wrought through stress of weather; and (2) that the wages of the ordinary labourers of the department, which at present are 21s. per week, be increased to 22s. per week for the nine months of the year during which, like the masons' labourers, they work fifty-seven hours per week, and that for the remaining three months during winter, when they work only fifty-one hours per week, and when they are paid for time not wrought through stress of weather, the wages remain at 21s. per week. The assistant Master of Works having reported that there were a number of causeway beaters (whose wages at present vary from 2s. 9d. to 5s. 2d. per week more than the ordinary labourers) who would require an increase corresponding to that proposed to be given to the latter, the Sub-Committee agreed to recommend that these causeway beaters be, like the ordinary labourers, granted an increase of 1s. per week on their wages during the said period of nine months, but not during the winter months. The Master of Works reported that the settmakers had applied to him for an increase of a halfpenny per hour on their present rate of pay, namely, 7½d., which, if authorised, would bring their rate up to 8d. per hour, which was the rate agreed upon at a recent meeting between the representatives of the Settmakers' Union and a committee of the Quarrymasters' Association. The Sub-Committee agreed to recommend that the settmakers be paid at the rate of 8d. per hour. The Sub-Committee also agreed to recommend that the holidays of the employés of this department, which at present consist of four days per annum, be increased to five days (without deduction of pay), such being the period allowed to the workmen of the water and tramway departments.

Builders' Notes.

The Leeds and County Builders' Exchange, whose members number about 250, have moved to Stanton's Buildings, in Duncan Street, Leeds.

Tenders for the Erection of Malvern Isolation Hospital were received by the Malvern Urban District Council from Mr. Broad, £9,300, and Mr. Holloway, £8,866 14s. The estimate of the Council's surveyor was £7,964 7s. 5d., and it was resolved that the hospital be erected by the Council, and the surveyor was instructed to proceed with the same as soon as possible.

A Nottingham Builder's Failure.—At Nottingham recently the first meeting was held of the creditors of John Oscroft, joiner, builder, and contractor. Debtor's statement of affairs showed liabilities £8,563 16s., and assets £1,651 10s. 5d., leaving a deficiency of £1,323 4s. 8d. After considerable discussion, a committee of inspection was appointed, and to them was left the question of the debtor's contract for the erection of Kirkby-in-Ashfield Board Schools.

Halifax Electricity Works.—Tenders for the extension of the electricity works at Halifax have been let as follow:—Masonry; Ben Riley, Halifax, £2,250; joiner's work, Samuel Greenwood, Halifax, £253 18s.; plumber's and glazier's work, William Ward, Halifax, £195 10s. 6d.; slater's and plasterer's work, Rushworth and Firth, £153; iron and steel work, Lee and Harrison, Leeds, £293; concreting, G. Greenwood and Sons, Halifax, £130; painting, Thomas Kendal, Halifax, £35.

Building Accident at Keighley.—Last week a serious accident occurred at some shops which are being erected on the south side of Cavendish Street, Keighley. The contractor for the masonry is Mr. John Brown, of Staveley Road, Bingley, and his son, Harry Brown, was working on the top of the building—a height of about 30ft. He was standing on the outer wall waiting for a stone to be craned up, and it is supposed that in a moment of absent-mindedness he stepped or slipped off the edge. He fell on to some scaffolding below, then rolled on to some boardings, and finally alighted on the pavement. A passing cab was hailed, and the injured man was conveyed to the District Hospital. One arm is broken, and there are injuries to the head. His condition was reported to be rather serious.

New Development in the Granite Trade.—The building trade in Aberdeen has recently been showing signs of less activity, but it may be some consolation to know that a new development has taken place. Hitherto the stones which have been sent away for building jobs to the south have consisted only of portions of shop fronts, banks, &c., which were mostly confined to the polishing yards. But about five or six years ago Messrs. A. and F. Manuelle executed an order for a villa in Blyth, one of the coming fashionable resorts on the Tyne. This had apparently given so much satifaction that the firm have had in hand for some time a much larger villa for the architect of the first one, the contractors being Messrs. J. and W. Simpson, of Blyth. The whole of the building is practically of granite worked in Aberdeen ready for building, the stones being specified to come from Dancing Cairns quarry, and they have all to be fine axed. Besides the villa itself a very imposing railing base and coping are also of fine axed granite. Mr. Andrew Burnett, builder, Persley, has had a large squad of men preparing a considerable portion of the stones, and Mr. Petrie, builder, Victoria Road, has also had some men at work on the contract. The first portion of the work is being shipped to-day, the remaining portion following in a few weeks.

Surveying and Sanitary Notes.

The Widening of Evesham Street, Redditch, and the consequent borrowing of £3,750 have been sanctioned by the Local Government Board.

To Students of Surveying.—The winter session of the courses of lectures and preparation, conducted under the presidency of Mr. Philip E. Pilditch, at 2, Pall Mall East, S.W., for the various examinations of the Surveyor's Institution, are about to commence, and final arrangements are now being made.

Widening of Old Street, London.—The St. Luke's Vestry have decided to send a strong letter to the London County Council, urging them to proceed with the widening of the western end of Old Street, at the junction of Goswell Road, which had been at a standstill for over eighteen months, with the result that business thereabouts was languishing, and the vestry are losing the rates of the vacant property.

Leamington Sewerage.—A Local Government Board inquiry was held last week by Colonel A. J. Hepper, into an application of the Leamington Corporation for permission to borrow £1,300 for works of sewerage in the borough. The loan is required for laying new sewerage mains to replace old mains which had become dangerous and had occasionally fallen in. It is also proposed to lay a new sewer on the Cubbington Road. There was no opposition to the loan, and the inquiry closed.

New Roads in Halifax.—The Improvement Committee of the Halifax Corporation recommend that in the Bill to be promoted by the Corporation in the next session of Parliament compulsory powers be obtained for the construction of a new road from the top of Salterhebble Hill along Chapel Lane, Bankhouse Lane, to the Salterhebble, Stainland, and Sowerby Bridge Road, between the canal bridge and the railway bridge over the above road; new road, 60ft. in width, from Skircoat Green, through Long Wood, Scarr Wood, Pye Nest estate, to Bolton Brow, Sowerby Bridge; new street from North Bridge Street to Winding Road; and the widening of New Bank from near Garden Street to Godley Bridge.

Pavement Dispute at Colchester.—At Colchester Police Court last Tuesday week, before Messrs. H. G. Egerton Green (in the chair), W. Buck, and A. K. Francis, the Colchester Brewing Company, of East Hill, Arthur Grimwood, trading as "Grimwood and Sons," builder, of Sudbury, and George Henry Page, architect, of Culver Street, were summoned at the instance of the borough surveyor (Mr. Herbert Goodyear) for displacing the pavement at East Hill without the consent of the Urban District Council. The town clerk (Mr. H. C. Wanklyn) appeared in support of the summons, and Mr. W. Young was for the defence, in the absence of Mr. E. Thomson Smith. The town clerk quoted from the section of the Public Health Act (1875), under which proceedings were brought, and which provided that any person who, without the consent of the Urban Authority, wilfully displaced, took up, or injured the pavements, stones, or materials in any highway repairable by the inhabitants at large, should be liable to a penalty not exceeding £5, and a further penalty of 5s. for every square foot of stones or material displaced. In this case, the borough surveyor, on Aug. 24th, visited a proposed new floor in the course of erection at premises in the occupation of the Colchester Brewing Company, at East Hill, and found that two excavations had been made in front of the building under the pavement, and that for the purposes of this excavation two large pieces of pavement had been removed. The pavement measured in each instance about ten feet in length and four feet in width. The borough surveyor called the attention of the builder's foreman to the encroachment on the footpath, and warned him that the work—which was being executed for the purpose of constructing a pair of cellar-bays—must not proceed. The foreman replied that this portion of the work was not shown on his plan, but that the architect had told him to go on with the work. The borough surveyor subsequently wrote to Mr. Page, calling attention to the matter, and stating that the cellar-bays must not be constructed; but Mr. Page personally replied that he should not stop the work, as he hoped this matter would go through. The plans of the new floor in course of erection were approved by the Sanitary Committee in May last, but they showed nothing in the way of cellar bays. Mr. Young, for the defence, emphasised the fact that the Brewing Company believed everything was being done legally, and that when they heard there was an irregularity the work was at once stopped. There was no evidence, he submitted, that the company had committed any offence, while, in regard to the other defendants, he pointed out that when a plan showing the cellar-bays was sent to the borough surveyor, it was returned with an intimation that the "block plan" was not shown. Mr. Page assumed that in all other respects the plan was correct, and proceeded with the work. The town clerk intimated that as regards the Brewing Company, the authority would be satisfied with an undertaking that they would reinstate the pavement displaced, and pay the costs of the case as against them. Mr. Young, on behalf of the company, expressed willingness to give an undertaking to the desired effect, and the Bench, on this condition, adjourned the case for a month, in order that the undertaking may be carried out in the meantime. Mr. Page was fined £1 and 14s. 6d. costs, while the case against Mr. Grimwood was dismissed on payment of 10s. 6d. costs.

Public Hall, Hartley Wintney.—The warming and ventilation of this building has been carried out by Messrs. John King, Limited, engineers, of Liverpool, by means of their "small tube" hot-water heating apparatus and special economical coil heater, and their patent tubular exhaust ventilators.

Engineering Notes.

The New Electric Tramways in Sheffield were inaugurated last week. The overhead trolley system was the one adopted. The cost of the conversion of the old system and the construction of the new has been about £315,000.

Dundee Harbour Trustees propose to introduce a Bill in the ensuing session of Parliament for power to borrow £100,000 for new works for the improvement and extension of the harbour and providing facilities for traffic, &c.

The County School, Neath, is being warmed and ventilated by means of Shorland's patent Manchester grates, patent exhaust roof ventilators and special inlet brackets, supplied by Messrs. E. H. Shorland and Brother, of Manchester.

Electric Light on the Borders.—The Lighting Committee of St. Boswells have instructed Mr. Purves, Edinburgh, to make application this autumn for a provisional order for electric lighting. Mr. Purves has also suggested a scheme for Kelso, which he states to be admirably suited for the purpose, and the scheme includes the running of an electric tram from the town to the station. Hawick and Galashiels have also schemes under consideration.

Improvements at Wrexham.—The Wrexham Town Council have made application to the Local Government Board for sanction to borrow £20,000 for electric lighting purposes, and they have now decided to further seek for sanction to borrow £2,100 for providing a refuse destructor, and incidental expenses for alteration of buildings and roads, and £1,700 for public baths, all to be constructed on the Willow depôt site, recently purchased by the Corporation.

Worcester Tramways.—The Electricity and Streets Committee of the Worcester City Council recommend the City Council not to consent to the Tramway Company's application for power to construct light railways in the city, but to oppose it, to take over their tramway undertaking when thought best, reconstruct, and work the whole system. The Company complain that this will prevent tramway extension and development of light railways in the city and neighbourhood for some years.

Oldham Tramways.—The Oldham County Borough Council have decided to adopt the overhead trolley system for employment with their municipal tramways. The reasons given for the adoption of this system are as follow:—(1) Cheapness of construction; (2) cheapness of maintenance; (3) simplicity of system and ease in effecting repairs; (4) the rapidity with which the line could be constructed, and the comparatively small interference with the surface of the streets and traffic. Mr. Newington is the electrical engineer. The scheme is expected to cost somewhere about £250,000.

COMPLETE LIST OF CONTRACTS OPEN.

Property and Land Sales.

FREEHOLD BUILDING ESTATE, fronting on main road and close to golf links and Highgate Woods, seven minutes' walk from Muswell Hill and East Finchley stations. To be LET on lease or SOLD in plots. Liberal advances to responsible builders if required. For plans and particulars, apply to Mr. GEORGE H. PAINE, Architect and Surveyor, 6, Stoke Newington-road, N. 6

BLUE COAT GIRLS' SCHOOL CHARITY ESTATE, GREENWICH, S.E.

To be LET by TENDER, on a repairing lease for 21 years, eleven conveniently-situated FREEHOLD HOUSES, with gardens, being Nos. 133, 135, 137 (The Little Wanderers' Home), 143, 145, 147, 149, 151, 153, 155, and 157 Greenwich-road, Greenwich, S.E., estimated to produce a rental of about £428 per annum, situate in a populous district, on a main road, and within two minutes' walk of Greenwich Station (S.E.R.)

Tenders for the above are invited, and must be sent in by SEPTEMBER 23rd next to the Offices of Messrs. BATCHELOR and BATCHELOR, the Clerks to the Charity, 52, Croom's-hill, Greenwich, S.E.

Intending takers may view the property at any time by permission of the respective tenants, and particulars and conditions of letting, and forms of Tender annexed, and any further information desired may be had gratis at the Offices of Messrs. BATCHELOR and BATCHELOR, the Clerks to the Charity, 52, Croom's-hill, Greenwich, S.E., and 15 and 16, Outer Temple, Strand, W.C.; and of Mr. THOMAS DINWIDDY, Croom's-hill, Greenwich, S.E., the Charity's Surveyor.

An acre of singularly valuable Freehold land, 270 yards from the Stock Exchange and opposite the north end of Throgmorton-avenue, Throgmorton-street, City, to be let upon 80 years' building lease direct from the Corporation, with a fully-licensed house thereon.

MESSRS. REYNOLDS and EASON are instructed by the Bridge House Estate Committee of the Corporation of the City of London to LET by PUBLIC AUCTION, at the Mart, Tokenhouse-yard, in OCTOBER, 1899, the above singularly valuable SITE of 44,038 square feet, with extensive frontages on Blomfield-street, London Wall, and Finsbury-circus.

Particulars, plans, and conditions of letting may be had, when ready, either of the City Comptroller, or the City Surveyor, Guildhall, E.C.; at the Mart, Tokenhouse-yard; and of the AUCTIONEERS, 43, Bishopsgate-street Without, E.C.

WIMBLEDON HOUSE ESTATE COMPANY, LIMITED.

The Directors are prepared to receive PROPOSALS for the SALE or LETTING of SITES for Private Houses on this property, which is being developed by the Company as a high-class Residential Estate.

The land lies high with a deep gravel subsoil, and has a frontage of over half a mile to Wimbledon Common, and is well timbered.

The Estate, which until lately was the residence of the late Sir Henry Peek, is situated in the best part of this much sought after suburb, and commands extensive views over the Common to the Surrey Hills, and the excellent service of trains makes it peculiarly convenient to gentlemen whose pursuits command their presence in London.

Plans and further particulars may be had by applying to the SECRETARY, at the Estate Office, Parkside, Wimbledon, or to the Surveyor, GEORGE HUBBARD, F.R.I.B.A., 85, Gresham-street, E.C.

R.I.B.A. EXAMS. PREPARATION, personally or by correspondence, in three, six, nine, or twelve months' courses. Architectural Lending Library. Special three months' finishing courses. — For full particulars apply to Messrs. HOWGATE and BOND, Associates R.I.B.A., Perchard House, 70, Gower-street, W.C. (close to the British Museum.

ANSELL and MALLOWS, Architectural Draughtsmen and Quantity Surveyors, 21, Buckingham-street, Strand, W.C.

ARCHITECTURAL Institute, Society of Architects, and Civil Service Technical Examinations. Preparation by correspondence, personally, or in residence. Seventeen first places.—MIDDLETON and CARDEN, 19, Craven-st., W.C.

PLANS, Applications, &c., Prepared by an experienced Architect. Advice given in Building Act questions, and disputes settled. — Address, "Architect," 17, Algarve Road, Earlsfield, S.W. 2

FOR SALE in the MIDLANDS, Builder and Contractor's BUSINESS and PREMISES, including a first-class and nearly new Steam Joinery Plant, with extensive Shop, Stables, and Residence, nearly new, and specially built for the business. Last ten years' annual income from £600 to £700. Will clear for £1,800.

Reason for selling, going out of business. The above in a healthy country district. — Apply Box 1165, "BUILDERS' JOURNAL" Office. 4

PERSPECTIVES.

CITY OF LIVERPOOL.

SCHOOL OF ARCHITECTURE AND APPLIED ART,
UNIVERSITY COLLEGE.

Sixth Session 1899-1900, commences Monday, October 2. In Architecture, a Two Years Course of preliminary training is provided for students to pass through before entering an Architect's office. Classes are also held in the Day and Evening for pupils and assistants already in offices. An Advanced Class in Design is held in the evening. Classes are held in Modelling and Designing Ornament and the Figure suitable for Sculptors, Modellers, Carvers, Plasterers, &c.; in Drawing, Painting and Decorative Design, the last being divided into two classes, specially arranged for students who wish to take up Decorative Work; in Wood Carving and Wrought Iron, especially in their relationship to Architecture; in Brass and Copper Work; in Stained Glass; in Enamelling, in Furniture and Fittings Construction, and in Furniture and Fittings Design.

Six Free Studentships are offered to the day classes, and Crafts' Studentships for students before entering their apprenticeship.

Eighteen Free Studentships are offered to the evening classes, two to each of the above-mentioned classes. Prizes are awarded at the end of the session to the most successful students.

For details of Classes, Free Studentships, Prizes, and all further particulars, apply to the Director,
PROFESSOR SIMPSON,
3 University College.

APPOINTMENTS VACANT.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

YOUNG ARCHITECT, in practice, wishes to meet another to join in competition work, either whole day or evenings.—Box 1,171, BUILDERS' JOURNAL Office. 1

JUNIOR ASSISTANT or IMPROVER. Finish-up, ink-in, colour, trace—rapid, neat, accurate. — Write age, experience, remuneration required, to "Brighton," Box No. 1,170, BUILDERS' JOURNAL Office. 1

DRAUGHTSMEN.—SIX DRAUGHTSMEN WANTED (under 30 years of age) for Government Surveyor's office. Must be neat, quick, ornamental writers. Accustomed to accurate estate plan drawing, after the Ordnance Survey styles. Salary Commencing 30s. to 36s. per week.—Apply by letter (specimens of work sent will be carefully returned) to DRAUGHTSMEN, care of Messrs. Reynell and Son, 44, Chancery-lane, W.C.

ASSISTANT. — WANTED at once competent ARCHITECTURAL ASSISTANT. Must be well up to Domestic and General Public Buildings, and with thorough knowledge of detail work.—Fifteen miles from London.—Send references, with age and lowest salary, to "G. H.," care of Wm. Dawson and Sons, 23, Northumberland-avenue, W.C.

APPOINTMENTS WANTED.

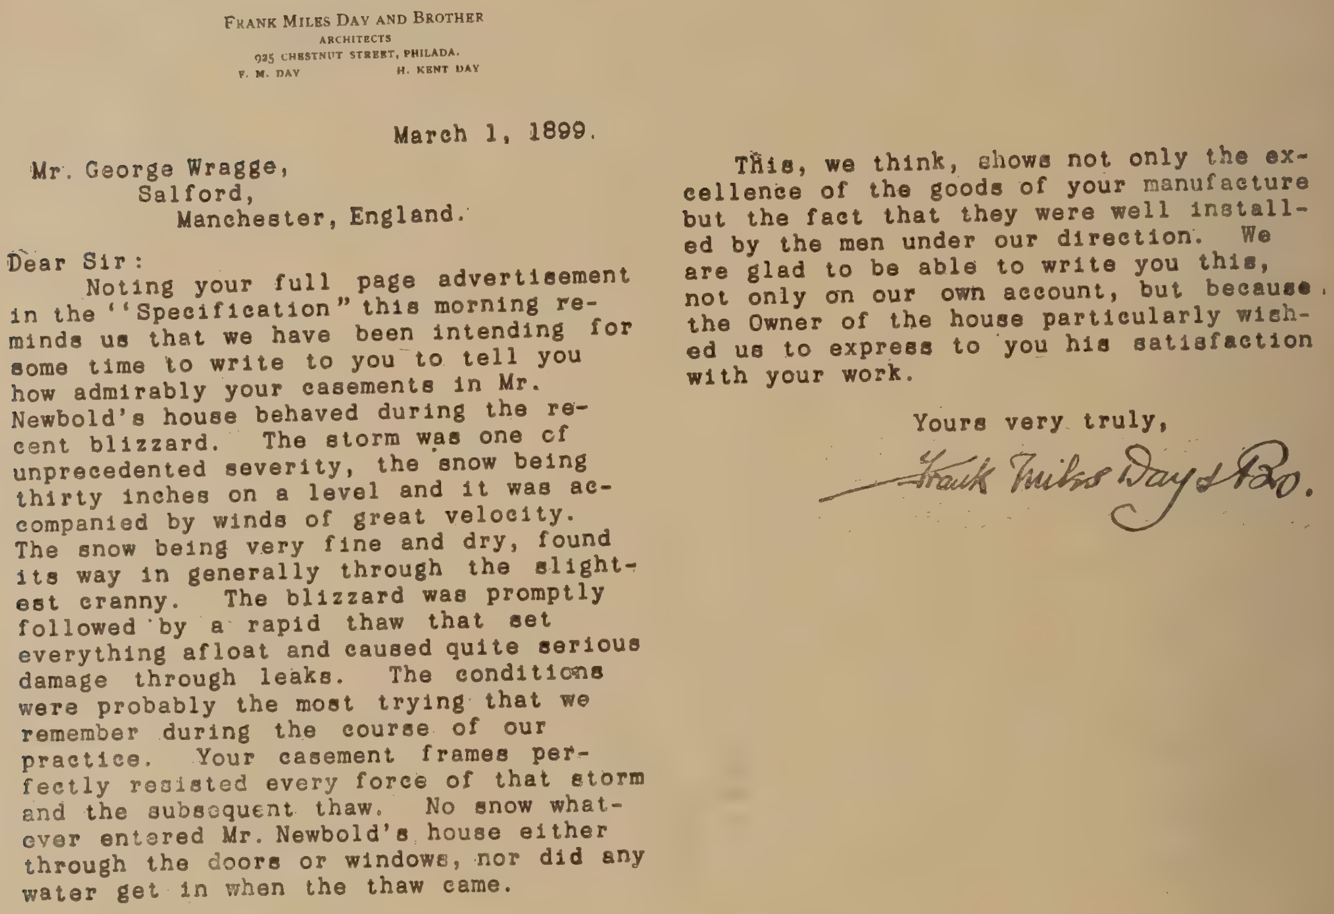
BLIZZARD IN AMERICA.

• • •

COPY OF TESTIMONIAL. (Unsolicited).



Frank Miles Day and Brother
Architects
935 Chestnut Street, Philada.
F. M. Day H. Kent Day

March 1, 1899.

Mr. George Wragge,
Salford,
Manchester, England.

Dear Sir:

Noting your full page advertisement in the "Specification" this morning reminds us that we have been intending for some time to write to you to tell you how admirably your casements in Mr. Newbold's house behaved during the recent blizzard. The storm was one of unprecedented severity, the snow being thirty inches on a level and it was accompanied by winds of great velocity. The snow being very fine and dry, found its way in generally through the slightest cranny. The blizzard was promptly followed by a rapid thaw that set everything afloat and caused quite serious damage through leaks. The conditions were probably the most trying that we remember during the course of our practice. Your casement frames perfectly resisted every force of that storm and the subsequent thaw. No snow whatever entered Mr. Newbold's house either through the doors or windows, nor did any water get in when the thaw came.

This, we think, shows not only the excellence of the goods of your manufacture but the fact that they were well installed by the men under our direction. We are glad to be able to write you this, not only on our own account, but because the Owner of the house particularly wished us to express to you his satisfaction with your work.

Yours very truly,

Frank Miles Day & Bro.

The above *UNSOLICITED* Testimonial refers to a very important order for upwards of 250 BRONZE CASEMENTS supplied to Mr. Newbold's Mansion, Philada. U.S.A. The sections used were Nos. 20, 22 and 24, illustrated in our NEW CATALOGUE, pages Nos. 10, 14 and 18 respectively.

An Architectural Causerie.

Style in Public Buildings. We never speak now of the "battle of the styles;" it is over, or at least the issue for which our elders spent their eloquence and their temper so generously, has changed. We are free to do what we like; Gothic or Classic, Greek or Barbarian, we may choose as we think fit, and no one can nip us with the criticism that our works are in a style inelegant or uncivilised. But the question which style we shall follow has given rise to a far more important one—that is to say, whether we are to follow any recognised style at all. "Why should we not form our own style," say the advanced party. "Our study of the works of earlier times has led us to the belief that in all good work the principle has been the same; honest subservience to constructional necessities, and for beautification a rightly measured imitation of the forms which nature has placed around us for our enjoyment; let us accept the principles suggested by the ancients and our own common sense, and work them out for ourselves to their natural result."

Well, these were inspiriting prophets; had mankind been complacently handling dry bones for the last three centuries, and were we the blessed generation that should inaugurate an era of fresh and vigorous life? Anyhow, we set about our work with eagerness; cottages were built, furniture was designed where constructive needs were alone responsible for the resulting appearance, and the ornamentation (if any) was carried out with strict regard to the imitation of natural forms. It is true such an ideal has been more talked of than realised; when you come to design anything, how difficult is it to prevent here an entablature and there a column—traces of that slough from which we have lately emerged—from creeping in; still, with small works there has been and still is an honest and more or less successful endeavour to work on the principles from which we hoped so much.

But success in small works is not enough; there is urgent need for an architecture like the Gothic, that is elastic enough to cover all wants; every day, large buildings have to be grappled with; every year there are more town halls, public baths, public libraries, and the rest, which have to be designed somehow. Here you would think is an opportunity for the new style—if such a thing exists—to justify itself in the eyes of a conservative and sceptical public. Yet for some reason or another the opportunity is not taken; on the contrary, in large works we fall back more and more upon the old styles; indeed, we have almost lost again the prerogative of freedom won with so much sweat twenty years ago; anybody who proposed to build a town hall or a court of law in the Gothic style, or indeed any style but the Renaissance would be regarded as a madman. The orders have returned to us in full force, and the shade of Sir Christopher Wren sits like lead upon our spirits. Nay, the very vanguard of the forward movement, the Glasgow designers, when they have some monumental work in hand, out-Herod Herod in the heaviness, the classicality, the Johnsonian character of their work. In the sculpture, the painting, the trimmings of their designs there are indeed many traits which shout negation to the idea that they belong to any century but the nineteenth; yet the structure of their decoration, the architecture pure and simple, is hopelessly, aggressively Palladian. Take Mr. Belcher again, in whose smaller work there is so considerable an effort to develop a style in accordance with the requirements of the present day; when he comes to a work like the Colchester Town Hall, away fly all such notions; the orders, with their capitals, bases, entablatures, pediments, and all the old properties of the Wren-Vanbrugh management, are brought out from the oblivion where they have lain—lain so long indeed that we cannot resist a sensation of pleasure at seeing our old friends once more resuscitated.

AT THE BACK OF THE HOTEL KÖNIGSTUHL, RHENS. DRAWN BY W. H. ANSELL. (*See p.* 97.)

Anyone who has tried his hand at one of the large competitions will, I am sure, feel with me how hard it is to do without the assistance of the orders in designing a large building; how nimbly cornices run along the elevations, and how quickly little circles scatter themselves about the plans. Why should this be so? We do not feel the same temptation when we are trying to design a house; it is only in a large work, where dignity and solemnity are required, that we instinctively feel for the orders. Cannot our modern style achieve dignity? Gothic could be dignified in large buildings as well as charming in small ones. Why cannot we do the same according to our lights? It seemed once as though the object might be achieved by a process similar to that of nature. A creature transplanted into a new set of circumstances gradually loses the use of those organs which have become valueless by the change, and develops others which have become necessary; so might we, one would think, starting with the Palladian style, its dignity, refinement, and practicability, have gradually cut out such features as were useless to us, and have been left with an architecture which would have been our own, at least, in so far that we copied nothing for the sake of copying it, but because we felt its use. This is the sense in which our house architecture is original. The ancients had windows and doors, and so have we, but we are not plagiarists on that account; and we are original, inasmuch as we have seen the uselessness—to us, at least—of many things which they considered essential.

But in our public and municipal architecture the very reverse process seems to be going on; unessential features and forms are introduced for their own sake, and our chief object seems to be to throw ourselves back to the very time when that rational conception of architecture, which our study of Gothic has taught us, was at its feeblest. Why should it be so? Is it that we are puny folk, and that any ideal of ours lacks breadth and size to embrace a large work? Can we only be artistic in a small scale and to express humble emotions? And for dignity must we always be compelled to borrow wholesale from the past? Architecture on a large scale then will never be anything but an allusive kind of art, touching us only by recalling to our minds certain bygone periods of the world's history, which we suppose to have been in some way better than our own. In that case we may as well build to recall the age of Dr. Johnson as any other if our tastes lie that way. But we must cease to hope for a true modern style; that can never be a true style which can only express our home-keeping emotions, and refuses to be with us when we come out to play our parts before men. E. B. S. S.

Beauty and Utility. IN despair of finding a satisfactory explanation of the quality which we express by the word "beauty," it is often said that it consists in the perfect adaptability to its ends of any object or organism, and the writer has even heard it maintained that a locomotive engine was a beautiful object on this ground. Now there is, no doubt, a certain beauty in fitness which is possessed by such things, and which becomes evident when the object under consideration may lack those æsthetic qualities which would otherwise compel admiration. There is, further, the beauty of excellent workmanship, which machinery must have, or the embanking walls of a reservoir, let us say, if they are to be capable of performing their work with safety to the public, and to those whose business it is to tend them; but it is obvious that such use of the word "beauty" is only possible in a very restricted sense, the qualities usually included in an adequate definition of it being many and various. Such different things as musical sounds, mathematical propositions, scientific building and engineering construction, poetical ideas, gradations and oppositions of colour, expressive drawing and delicate silhouette, to name only a few, without by any means exhausting the catalogue, may have the term applied to them with some degree of fitness, and it may be the loose way in which the word "beautiful" is used which is to blame for the confusion of thought. Strictly speaking, it refers purely to emotions aroused by æsthetic qualities, and it is inaccurate to make use of such phrases as "a beautifully built wall," when, what is really meant, is that the construction is sound, the stones well cut, or the bricks evenly set. This may be excellent building, but does not in itself constitute beauty. If the wall be really beautiful (apart from the lovely accidents imported by the lapse of time) it is so by reason of the just proportioning of voids to solids, by the spacing of the windows and doors, by the reticent jewelry of its carved ornament, and so on, the beauty residing in the design and not in the excellence of workmanship. But as soon as one touches ornament the manner of workmanship becomes of importance, no matter in what material it be carried out, and this importance increases in proportion as the object ornamented approaches the confines of what is called "Fine Art," until the point is reached at which a subject which is ignoble may be dignified by the manner in which it is rendered. To assert, as is sometimes done, that it is only necessary to build simply and fulfil requirements perfectly to gradually evolve a fine architecture, is to confuse mechanism and design. Architectural effect depends upon proportion, spacing, mass, silhouette, projection; not upon mechanical excellence in building or even convenience in planning. The simplest building and attention to average requirements in planning produced the rows of uninteresting brick boxes of the earlier part of the century, and it is as useless to expect that good architecture should spring from pure utility as to seek for roses in the place where cabbage seed has been sown. S. S. G.

On Reflection.

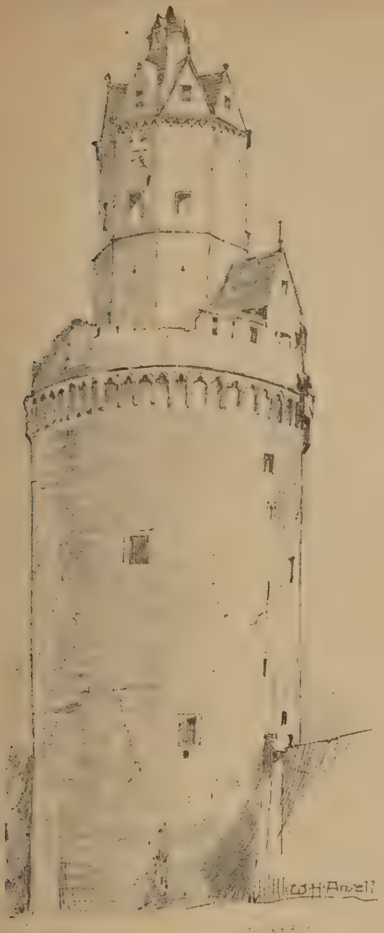
Boycotting the Exhibition. THERE seems to be some danger lest the Englishman's strong sense of justice may impel him to an act of gross injustice. This statement, parodoxical as it seems, is strictly true. All Englishmen, without distinction of creed or party, have been filled with indignation at the outrageously cruel and unjust act of five French officers at Rennes. Therefore it is proposed that we should show our indignation by boycotting the Paris Exhibition of 1900; some, indeed, would go further and break off all commercial relations with a nation which can perpetrate so foul a wrong, and apparently would have us treat every Frenchman as "a heathen man and a publican." Not a few of the generous souled and impulsive—but illogical—amongst us have actually begun to put the boycott into practice. We read of firms which had booked positions for the Exhibition withdrawing their names, of individuals refusing to purchase French wares, of a Town Council declining to accept a French tender (although the lowest), and of an employer discharging those of his workmen who happened to be Frenchmen. This last incident, it is true, occurred in America, but it may be quoted as an example of a spirit which seems to prevail somewhat widely in this country. A little reflection would surely show that such manifestations are both futile and unjust. Admitting, for the sake of argument (a large admission), that we are justified in seeking to punish for their wrongdoings the citizens of a friendly foreign state, it must be obvious that our punishment has the fatal defect of falling most heavily upon those who deserve it least. It is not the military, but the commercial classes who would suffer most from the effects of an extensive boycotting of French commodities (if such a thing can be conceived of as possible), and it is absolutely certain that amongst those who would feel it most keenly would be many who have been and are entirely out of sympathy with the evil doings of the military clique. There is wisdom as well as humour in the advice of the "Daily Chronicle's" cockney poet:

> In the cause o' the right punch as 'awd as yer like,
> But be sure yer don't punch the wrong 'ead.

But, of course, the whole thing is utterly futile. The commercial interests of the two nations are too closely intertwined to be seriously affected by this outburst of feeling. There is reason to hope that by the time these lines are printed the French Government will have repaired—in some degree—the wrong that has been done. But, however that may be, it is absolutely certain that no amount of boycotting can afford one iota of help to Captain Dreyfus and his family. Moreover, such proceedings are very like what might be described in homely language as cutting off one's nose to spite one's face. We maintain commercial relations with France, because it pays us to do so; to break off such relations would be to injure ourselves as much as our neighbours.

A Clacton=on=Sea Competition. ONCE more we have to call attention to an architectural competition promoted by a local council, the members of which seem to have a very inadequate sense of what is due to the competing architects whose time and talents are placed at their disposal. The competition in question was for the laying out of about 900ft. frontage of cliff, and the erection of a pavilion, with covered promenade, reading and refreshment rooms, &c. In the conditions the Clacton Urban District Council state that they will be guided in their award by a F.R.I.B.A. The designs were sent in by July 24th. Instead of the assessor having been appointed before the date named, it was some time after the delivery of the drawings that the Council applied to the President of the R.I.B.A. to give them the names of suitable Fellows from amongst whom they might choose an assessor. The President declined to name more than one, and added that the fee would probably be about 100 guineas. As there are only seven designs, the Council thought this excessive, and it was suggested that each councillor should make inquiries with a view to the nomination of a suitable referee. Two names were proposed, viz., Mr. F. J. Eedle, of 8, Railway Approach, London Bridge, and Mr. A. Sykes, A.R.I.B.A., neither of whom are qualified, not being Fellows of the R.I.B A., as required by the Council's conditions. Mr. Eedle has been appointed by the Council. It is to be hoped that this false step will not be persisted in. The unsuccessful competitors could very probably object to Mr. Eedle's award. In these competitions a recognised authority, beyond suspicion in every way, should be appointed, and the conditions strictly adhered to. We hope to publish a note on the designs when they are publicly exhibited.

Architects' Advertisements. THE professional man of the present day does not seem to regard the advertising of his ability in the same light as was customary in former years. The architects of the past generations stood aloof from all advertising, whether direct or indirect, considering that such would be beneath them as professional men. This, however, is not the case with many architects of the present day. It is true that in this country they do not openly advertise, but only do so in an indirect manner. But our brothers across the Atlantic have got ahead of us in this respect, if one may judge by their advertisements in the American magazines. One we came across lately may be quoted as an example. "DON'T BUILD AN OLD HOUSE," it begins. Having given—in very large type—this piece of grotesquely superfluous advice, the authors proceed to remark that "on receipt of 50c., in 1c. or 2c. stamps, we will send post-paid a copy of 'S—'s Modern Houses, No. 57 just out, and guarantee to forfeit 1,000dols. in cash if you find therein a design ever before published by us." After giving details and prices of their portfolios of designs, the advertisers point out that they will return your money if the wares are not satisfactory, attend to business with promptness and despatch, and generally conduct themselves after the approved manner of the diligent tradesman. These advertising architects invariably publish a book of designs to prove to the public the greatness of their genius. These books evidently have a large sale, for one advertiser (an Architectural Co.) says: "From our plans shown in 'Modern Homes' 154 buildings were erected in 1897, and we received orders in the month of March for building designs covering a cost of 105,000dols." The advertisement is usually accompanied by a perspective sketch of one of the author's buildings, and occasionally by plans, which, to the English mind at any rate, possess little of the comfort the architect always claims for them. For instance, there is an inexpensive cosy home advertised by a Grand Rapids architect. From the plan it would appear rather awkward if there were many callers at this house during dinner time, seeing that it would be necessary for the servant to go through the dining-room to answer the door. 1,600 dollars builds this house complete. It is to be hoped that the Americans will long be ahead of us in regard to advertisements, for one could hardly consider such worthy of a professional man or an artist.



WATCH TOWER, ANDERNACH-ON-RHINE.
DRAWN BY W. H. ANSELL.

SOME RHENISH VILLAGES.

By W. H. ANSELL.

THERE is an idea current amongst many people that the beauty of the Rhine has departed, that, although the tourist and the mere honeymooner may find it all-sufficient, to a critical artistic eye it is sadly deficient.

The Rhine, however, has much character which cannot be discerned from the deck of a steamer under a midday sun. It is necessary to lose one's self in the little villages which line the stream under the shadows of the vine-clad hills, to wander in the early morning along the banks, with the land taking new shapes under the rising mists; or in the evening when the tired oxen are brought down to bathe and drink, after a hot day's work in the fields, when the boats swinging out into the stream stand black and strong in the yellow light, then it is that the heart of the painter, and even of the architect, rejoices.

Cologne, where I first saw the Rhine, is somewhat disappointing: a busy, apparently prosperous city, with very little of the picturesque remaining in its streets, while the traditional smells which have made its name famous seem to have entirely disappeared. The Dom and the many Romanesque churches redeem the place from monotony and deserve careful study. The latter are strongly reminiscent of Lombardic work, with the round apsidal ends to choirs and transepts, and open arcaded galleries giving a deeper note of shadow and mystery under the broad eaves.

On going up the river it is perhaps better to take train as far as Bonn, and commence the journey by boat from there. The first place worth staying at is Andernach.

Here there is a beautiful transitional Romanesque church, with four towers. The font is a delightful piece of work of the thirteenth century. Andernach is an ancient town, having been of some importance in the time of the Roman occupation; it has suffered a great deal by the different wars which have been waged in the district, but still possesses features of architectural interest, conspicuous among which is the fifteenth century watch tower.

Across the river is Leutesdorf, a quaint little village, where apricots are plentiful.

The ferry boat, by which one crosses the stream, is fastened by a long chain to a buoy moored centrally, and swings from side to side of the river like the pendulum of a clock. The strong current supplies the motive power, according to the inclination given to the boat by steering.

From Andernach to Coblentz is not a far cry, and from thence the journey may be continued to Rhens either by train or by a local service of small steamers. The larger boats do not stop at this, one of the most charming places on the river. In Coblentz the prevailing note is militarism. Every second man is a soldier; forage wagons and all the varied impedimenta of barrack life continually pass along the streets; the fortress of Ehrenbreitstein across the river dominates the place, and the arts of war are in constant evidence.

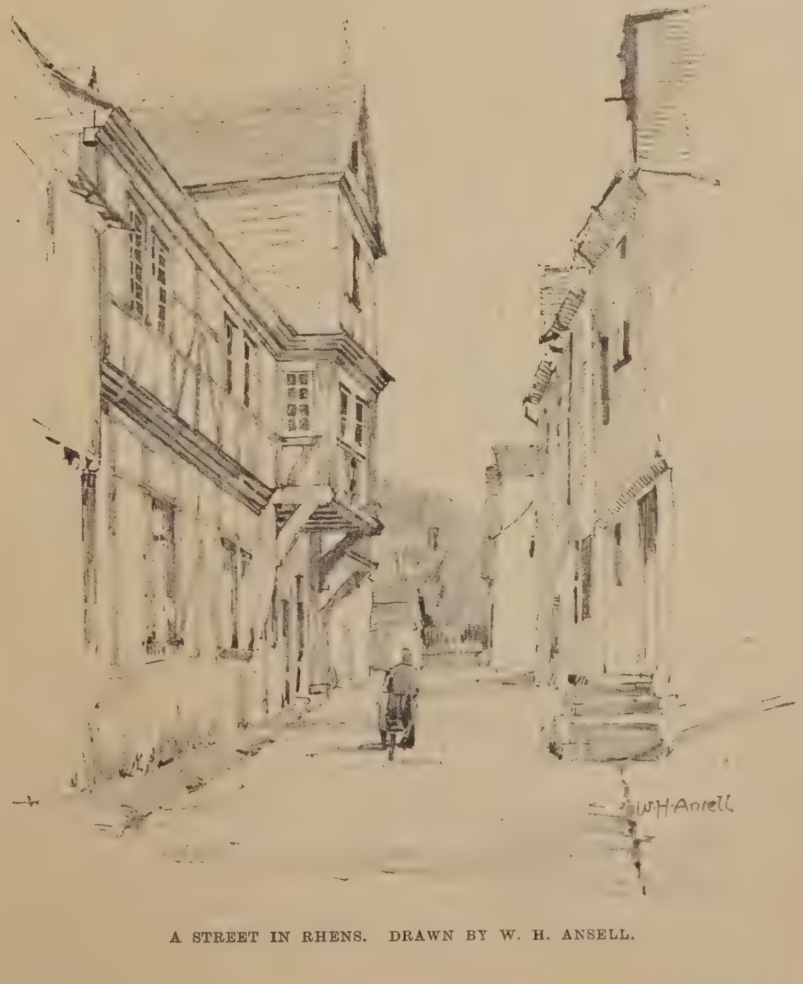
In Rhens, on the contrary, though only five or six miles away, all is peace. It is 1899 in Coblentz; it might not be more than 1699 in Rhens. The little town still retains its protecting walls dotted at intervals by round watch towers. The roads, whether down to the river or out among the orchards, still pass under the arched gate houses, from the machicolations of which the good people of Rhens doubtless gave warm receptions to impudent invaders in days gone by. The husbandman yokes his bullocks to the quaint wagons in exactly the same way as his grandfather did, and the slow-moving animals, as with quiet clatter they pull the sweet-smelling hay up the steep cobbled streets, are exact reproductions of their ancestors that did the same work in the same streets two hundred years ago. The houses in Rhens are mostly of the fifteenth, sixteenth, and seventeenth centuries, placed irregularly, and without regard to the lines of the streets. They are solidly built of timber, with stone filling between the woodwork, which, having been left from the tool without paint, has in consequence acquired a beautiful silvery tint.

One notices the overhanging stories with brackets and curiously carved corbels, the long sagging moulded beams, capped with brilliant splashes of colour where the window flowers grow, and the high pitched roofs dotted with many little pointed dormers. The timbers in many cases are numbered consecutively in Roman figures, commencing from the angle posts. This was evidently done by the carpenters who prepared the pieces, to ensure their being fixed in the right positions.

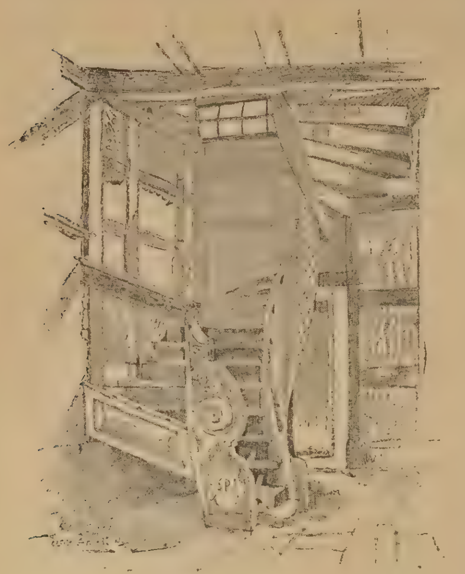
The interiors of the houses are most interesting. I sketched the staircase in one fine old place, where the central newel, with the handrail curving round it, is formed out of the trunk of a tree, the broad bole being left at the bottom to form a base. In this house the wooden construction of the walls showed on the inside, only the part between the timbers being plastered. The Hotel Königstuhl, by the river, is a quaint country inn, built about 1620. My quarters were connected to the main building by a railed-in balcony on the old town wall, over which the inn has been built. Across a little hall one entered a long, low corridor or gallery open on one side to the garden, with shady eaves and timbers gone silvery grey and green with age. The yard below was a delicious harmony of cool, quiet colour, whilst through a dark archway one looked into the brilliant sunlit garden beyond.

Near Rhens are several villages having the same character, full of charming delicate colour. On the same side of the river are Brey, Spay, and the rather larger town of Boppard, with its typical Romanesque church. On the other side are Braubach, Filsen, and Osterspai, all full of paintable subjects, bits of quaint courtyards, peeps of the river down narrow streets, and much interesting architectural detail.

The ordinary household pots are a source of constant pleasure. Of curious shapes, with good colour and glaze, they have all the little variations which show the handiwork of a man, as distinct from the machine-like uniformity



A STREET IN RHENS. DRAWN BY W. H. ANSELL.



STAIRCASE IN HOUSE AT RHENS: DATED 1611. DRAWN BY W. H. ANSELL.

of so much of our pottery. They would grace a studio or a kitchen, and it is matter for regret that in England such pots are oftener found in the studios than in the kitchens.

The peasantry are quiet, hard-working folk, and, when working in and among their homes, one feels keenly the inability to communicate freely with them. What old world legends, what folklore, what interesting local history one might hear from these people if one only knew the language more perfectly? Stevenson in one of his essays says:—"It is not those who carry the flags, but they who look out of the upper windows who have the fun of the procession." There are, however, some windows too high to serve any useful purpose to the sightseers, and being in a country with only a smattering of the language is looking out of a very high window indeed.

GLASOGRAPHY.

THIS is the name applied to a new patent process for producing on glass, by mechanical means, any design in transparent colours. Although colours could formerly be applied to glass they did not, until this process was introduced, attain sufficient transparency to make a perfect substitute for stained glass. The process can also be applied to the manufacture of tiles for decorative purposes, and also to the production of artistic advertisement plates in glass. An exhibition of the different uses to which the materials can be put was given last week under the auspices of the Economic Commercial Association of 29, New Bridge Street. Some examples of substitutes for stained glass were shown, which although they had been exposed to the light for some months, and in one case steeped in boiling water, still retained their brilliant appearance. The process—which, by the way, is patented in all the leading countries of the world—consists in affixing a lithographic or photographic transparency in any variety of colour to the back of a sheet of glass, which, after being varnished, is coated with a specially prepared wear-resisting composition, very much resembling enamel. The effect of the finished article, although accomplished in such an easy and simple manner, is, nevertheless, very striking. The inventor claims that the work can be produced at a very great reduction on the ordinary ruling prices, so that its cheapness will bring it within the reach of everyone. For decorative purposes in public or domestic buildings, and for the enrichment of artistic details, the glass tiles with coloured designs possess considerable possibilities. A company will shortly be formed for the purpose of working and developing the process.

CONSTRUCTION OF SANATORIA FOR CONSUMPTIVES.*

BY F. R. WALTERS, M.D., M.R.C.P.
Physician to the North London Consumption Hospital.

THE characteristics of a sanatorium for consumptives are best determined by a consideration of the objects and methods of treatment for which it is intended.

The *objects* are to treat consumptives, who are not moribund, by hygienic and other methods, so as to restore them to health. Medicinal treatment may (and should) be included, but hygienic means are of first importance. These hygienic means consist mainly in a regulated and abundant diet, extremely free ventilation with the purest air, as far as possible an outdoor life, and the regulation of rest and exercise, and of all other details known to influence the course of the disease on the well-being of the patient.

Locality.—It has been argued, but on insufficient grounds, that the place and the building where such treatment is carried out are of no importance. But although many different places are more or less suitable, to obtain the best results we must carefully choose the climate and locality for each individual patient. And although ordinary houses may sometimes be adapted to the purpose, they are usually far from convenient, and sometimes quite unsuitable.

An ordinary House is usually inconvenient for the following reasons: (1) Thorough ventilation of the patient's room is essential, and this is apt to interfere with the comfort of the other inmates of the house, unless it has been specially planned. Moreover, few ordinary rooms are capable of being continuously flushed in all weathers with fresh air from outside. (2) Ordinary rooms are usually full of dust-traps, projecting ledges, ill-fitting boards, unwashable walls, and the like. (3) It is exceptional to find shelters for the open air treatment in wet weather, or arrangements to exclude rain while they freely admit fresh air; and it is not always possible to find suitable places about the house for open air shelter to which the patient can be wheeled on his bed or couch.

The ordinary Household is even more of a drawback than the ordinary house. Servants cannot be readily trained in new ways of cleaning; the presence of a trained nurse, without special provision made for her, leads to difficulties; and fond relatives are apt to be guided by their ever-present prejudices rather than by the injunctions of the non-resident doctor. Moreover it is difficult to obtain for the patient that perfect rest and quiet and freedom from emotional excitement which are so important in febrile stages of the disease.

Hotels and Boarding-houses.—Similar arguments may be brought forward with even more urgency against the ordinary hotel or lodging-house, where the prevailing motive is apt to be pecuniary, and the individual has to accommodate himself to the wishes of the majority.

Open Health Resorts.—Treatment in open health resorts therefore labours under great disadvantages. Not only are the woods and gardens wanting in some of the requirements for consumptive patients, such as adequate shelter against wind and weather, and freedom from dust, but supervision is difficult and treatment relatively expensive. General practice is incompatible with proper supervision of more than a very small number of such patients, and a small number is not remunerative. Dr. Macgahan, who founded an open villa sanatorium at Aikin in South Carolina, finds a dozen households as much as he can superintend, and loses money over them into the bargain.

Specially arranged Sanatoria, completely equipped, and provided with their own medical, nursing, and administrative staff, are therefore far better than an open health resort, both for doctors and for patients; while they constitute the only means of providing suitable treatment for the poor at a reasonable cost.

Size of the Sanatorium.—A large sanatorium can only be managed with the help of several medical officers. This may lead to divided responsibility and imperfect supervision, unless the subordinate medical officers are of nearly the same quality as the chief medical officer. On the other hand, a small sanatorium is relatively expensive, and may be unnecessarily dull for the patients. Probably

---

[*] A Paper read before the Annual Congress of the Sanitary Institute, held at Southampton on August 29th, 30th, and 31st.

GATE-HOUSE, ANDERNACH-ON-RHINE. DRAWN BY W. H. ANSELL.

forty to fifty patients could be managed by one medical officer. Most of the newer sanatoria in Germany for the working classes have about 100 beds, and the Brehmer sanatorium for paying patients now has a total of 335 beds, while the smallest complete sanatorium in Germany has, I believe, 16 beds; but there are few with less than 20 beds.

Component parts of a Sanatorium.—In addition to the shelters in the grounds, a sanatorium consists of Administrative, Commissariat, and Patients' departments.

The Administrative Department includes the offices, perhaps a board room, quarters for the medical officers, nurses and servants, a disinfector, mortuary, and frequently also engine and dynamo house, laundry, stables and farm. The servants should, if possible, have a block to themselves, or quarters over the kitchen block, male servants separated from female, and the housekeeper in some central part where she can control the indoor servants. Nurses must be within call of the patients, but should have a private sitting-room as well as bedrooms, the matron in touch with the other nurses. The chief medical officer's quarters should be within easy distance of the patients' rooms, and be so placed that he can readily supervise them when in the grounds. Where there are several medical officers, one should have his room near the patients. The disinfector may be combined with the laundry and electric supply, the mortuary with the stables, and all these should be some distance from the patients' quarters, as well as, of course, the farm, if there is one.

The Commissariat Department, consisting of dining saloon, kitchen, scullery, store rooms, &c., should be far enough from the patients' quarters to prevent noise and smell from reaching the latter.

The Patients' Quarters are least like the rooms of an ordinary house. They include bedrooms, sitting-rooms, and accessory rooms, such as bathrooms, lavatories, and the like. The chief points to be borne in mind in their construction are as follows:—(1) They should admit as much fresh air and sunlight as possible, and be purged of foul air as completely as possible, approximating in this respect to the open air. (2) They should be as far as possible from ledges and other dust-traps; all angles being rounded, floors free from cracks, walls washable, and ceilings cleansable. Both rooms and furniture should be made with a view to ready cleansing with damp cloths. (3) They should be dry, and their windows should exclude rain and strong wind, while freely admitting light and air. (4) They should be cool in summer, warm in winter. (5) They should admit of patients being readily carried on couch or bed on to a balcony or terrace, or into the grounds. (6) There should be ready means of communicating with the doctor, nurse, and servants. (7) The rooms should be quiet and reasonably private.

Size and Shape.—Cubic content is of far less importance than large inlets and outlets for ventilation kept constantly open. Too small a room, however, may be draughty, although this is less objectionable than a foul atmosphere. Oblong rooms with the narrow end to the front are less expensive than those with a larger frontage; but where expense is no object the latter are preferable. There should be one corner for the bed out of the direct air current, so that door and window may be kept open. There should only be one patient in each room. The only exception to this rule is where patients are without expectoration, cavities, or fever.

A southerly *aspect* is advisable wherever patients are likely to occupy their bedrooms in the daytime. But where they only do so at night, and there is adequate protection outside against wind, the aspect is of less consequence.

Ventilation.—A chimney or corresponding air-shaft should always be present, even where the heating is by pipes. A large ventilating opening should be placed over the door. This should not be covered with a grating. Small valve ventilators are not to be recommended as inlets. Their valves are noisy, the area is so small as to be apt to cause draughts, and their gratings collect the dust. Tobin's tubes are permissible; but all such contrivances are unnecessary so long as the windows are kept open and there is sufficient outlet. Boyle's extractors, or steam-jets may, however, be useful in expelling foul air.

The *windows* should occupy at least half the wall space of one side. If casement windows are used, they should open outwards to right and left and have a transom over them or else an adjustable blind rising from below. The window sill should not be more than 2ft. from the ground, so that a patient lying on a couch can easily see out. If there is a terrace or balcony outside, a height of 6in. or 1ft. is preferable, unless the part below the window is removable. Very large ordinary English or guillotine windows have some advantages, although only half the area is available when the sashes are open to their full extent, and there is less protection against wind. They can readily be fixed in any position; they allow of a double amount of air, and give a greater sense of security at night. With such windows sliding shutters may be used with parallel horizontal sloping laths; with casement windows the shutters must be hinged from above or below. At Ruppertshain a kind is used which can be let down from within the room like a hood, and used either as a sun blind or rain screen. Such shutters are also useful in excluding light in the early morning, as some patients can only sleep in the dark. All window fixings and blinds should be free from noise when the wind blows. Ordinary roller blinds or Venetian blinds are apt to be noisy at times with wide open windows.

THE CHURCH, BOPPARD (A.D. 1200). DRAWN BY W. H. ANSELL.

If *verandahs* are provided, they should have glass roofs. To give sufficient protection from driving rain, they should be 15ft. wide. They may, however, be replaced entirely by shelters to the sides of the house, if the couches can be wheeled out from the bedrooms into the shelters. *Balconies* are apt to darken the rooms below, if they are wide enough to be practically useful. They should, therefore, be placed over parts not frequented by patients, or converted into part of the ceiling of the room below. At Dannenfels an inequality of the ground is utilised to provide a large balcony or terrace level with the first floor, over cellars level with the ground floor. The *door* of the room should have a frame flush with the walls, and be free from panels or ledges which collect the dust. If the door opens into a well-ventilated corridor, it may be replaced in hot weather by a skeleton wire door, privacy being secured by a screen. Bolts should not be supplied to the bedroom doors.

If they have locks, the matron should have a master key in case of accidents. There should be some means of fixing the door open at various angles, to prevent slamming. *Cupboards* should have rounded angles; they should not be sunk below the level of the floor, and should have no dead space above. Movable wardrobes can be better ventilated than cupboards. The *floor* of the room may be of waxed and polished boards, or of well-fitting unpolished boards covered with linoleum. The latter should be all in one piece, and a trifle larger than the floor itself, curling up at the sides, to be fastened by a wooden fillet, as at Dr. Burton Fanning's new sanatorium. In some German sanatoria a material called *torgament* is used for flooring. It consists of wood shavings incorporated in some way with cement, and is warmer to the feet than the latter, while equally indestructable and capable of disinfection.

The *walls* may be of Parian cement, as in many hospitals, or of ordinary plaster, painted or papered with washable paper, or panelled with wood and varnished, or covered with lincrusta or similar materials. Wood-panelled walls are said to become infested with mice. An inexpensive method of transforming an ordinary lath and plaster wall is to paint it with silicate paint. The *ceilings* should be without cornice, with rounded angles. In some sanatoria they are of varnished wood panelling. They may, however, be whitewashed, painted or papered.

Arrangement of Bedrooms.—The bedrooms should be arranged in a single row, rather than on two sides of a corridor. The corridor, which may be paved with terrezzo or tiles, or covered with linoleum or some less noisy material, should end externally and have numerous windows, which should be opposite the doors of the bedrooms if there is adequate shelter to the north. They are intended to be almost constantly open. It was suggested to me by Dr. William Ewart that an offensive patient might contaminate the air of the corridor, and that this could be overcome by closing the door of the bedroom and letting the ventilator over it communicate with the outside by a shaft above the corridor. Another way would be to replace the corridor by a covered walk or verandah. No rooms should be placed to the north of the corridor, excepting such as can be left almost constantly open.

Sitting-rooms for Patients should be neither large nor numerous, excepting such as are really modified summer houses. Recreation pavilions should also be out of doors. The dining saloon must of course be large and well lighted and ventilated. During a good part of the year in England the meals could quite well be taken in a summer house or tent. A warming cupboard would be required for plates and dishes and a warm box to carry the food.

Accessory Rooms.—The lavatories, bathrooms, w.c.'s, cloak-rooms, and box-rooms should not be too far from the patients' bedrooms, but may be placed on the north side in built-out pavilions. No unnecessary luggage should be left in the bedrooms, and it is a good plan, if possible, for all ablutions to to be done in the lavatory, so as to keep the bedroom drier. In private sanatoria, however, this cannot well be done. In the Nordrach Sanatorium a douche apparatus with hot and cold water is placed in each patient's bedroom. Waste pipes always become foul unless capable of being mechanically cleaned, so that no fixed basins with narrow waste pipes should be employed, least of all in the bedroom. Sanitary arrangements may be constructed on ordinary principles. It is unusual to have tubercle bacilli in the excreta of such patients as would be admitted to a sanatorium. With water carriage there cannot possibly be any danger from the excreta; and with dry methods exposure to light and air or admixture with chloride of lime is sufficient to disinfect them.

Consulting and Waiting Rooms may quite well be in a separate pavilion or summer-house, as those who are not fit to walk so far would be seen in their bedrooms. Drug room, laboratory, room for Röntgen rays and photography, inhalation room and the like, would be put next the consulting room.

Heating.—The sanatorium may be heated by hot water or steam pipes, if care is taken not to allow charring of dust particles to take place, or over-heating of the rooms. Most of the German sanatoria are heated by low pressure steam pipes, as the quickest and most economical way of warming a large building. Open fires are invaluable for ventilation, but require more attention and are apt to be dusty. Closed stoves are only permissible with a cooling jacket, and in any case are of doubtful expediency. At Nordrach, where water power is abundant, some of the rooms are now heated by electricity.

Lighting should be by electricity, or failing this by lamps and candles. Gas is apt to render the air impure, unless special ventilating shafts are put for each jet. Incandescent gas-lamps with by-passes are not to be recommended. Acetylene is used in some sanatoria, but appears to me to be unsuitable.

Arrangement of the Sanatorium.—Such being the component parts of a sanatorium, it remains to consider how they may be best arranged. This, however, depends largely upon the site and the area of suitable ground. On mountain sides it is usual to build a sanatorium in several storeys; where more level space is available, the building may consist of a number of low cottages or villas.

Number of Floors.—There is some prejudice in this country against putting bedrooms on the ground floor; but where the foundations are properly built, with damp-proof courses and the like, and the ground is dry and well drained, it is not clear that buildings of one floor are any less suitable than higher ones, so long as sufficient privacy can be ensured. Couches and beds may be more easily wheeled out from the ground floor; no lifts, staircases, or balconies are needed, and there is no risk of one floor ventilating into the next. But in higher buildings a better view is obtained from upper floors, and the bedrooms above are more easily kept private and are quieter. And by suitable arrangement of the staircases, corridors, and approaches, it is quite possible to prevent the entrance of foul air into upper rooms. All corridors and staircases should have free and direct communication with the outside air. This also applies to cellar stairs. As regards relative cost of high and low buildings, this depends largely upon the amount of level space in suitable spots available.

Cottage Sanatoria.—Temporary sanatoria of tents, wooden buildings, or "bracken," are frequently interdicted by local authorities, and need not therefore be considered. In a large sanatorium the cottage system has both advantages and disadvantages. Different sets of patients can be readily isolated, as, for instance, if an infectious fever breaks out. A small building having a relatively larger wall surface than a larger one is more easily ventilated from all sides. This is an advantage in a sheltered situation, a disadvantage in an exposed one. Scattered small buildings need a relatively larger staff, and are more expensive to supervise. On the other hand, they are less "like an institution," and may therefore be preferred by some patients. In a cottage sanatorium some patients have necessarily to walk further to the common dining saloon, as the plan of having separate dining-rooms for each block is inconvenient and wasteful. The more concentrated the plan, consistent with free ventilation, the easier and the less expensive are the supervision and management of a sanatorium.

Ground Plan.—The chief varieties of possible ground plans for a sanatorium may be classed as follows:

1. Linear—straight, convex or concave.
2. Linear with wings or pavilions at a right angle.
    (*a*) Open quadrangle—three sides of a rectangle.
    (*b*) Closed quadrangle—not permissible.
    (*c*) Bayonet joint—two sides of a rectangle.
3. Linear with wings at an obtuse angle.
4. Parallel lines joined by others at right angles.
    (*a*) Letter T. (*b*) Letter H.
5. Radiating.
    (*a*) From a straight line.
    (*b*) From a central point.
    (*c*) From a convex corridor.

Any of these plans may be arranged with interceptions.

It is not possible to say that any one of these plans is best in every case, as the nature of the ground and the degree of natural protection have to be taken into account. The less the natural protection, the greater the need of protection by means of a high building or of wings. In such a case the plan adopted at Hohenhonnef is a very good one, although the number of luxurious sitting-rooms there is apt to tempt patients to remain too much indoors.

Liegehallen.—There is some difference of opinion concerning the deep verandahs provided at many sanatoria, where patients rest in company on their wicker reclining chairs. Febrile patients, who most need to rest, are best kept in more or less seclusion; but, for the hour's rest about meal times, there is no reason why non-febrile patients should not use the common verandah or "liegehalle." But such a verandah in front of patients' bedrooms interferes with quiet and privacy; so that "liegehallen" are often placed on either side of the building, somewhat like wings.

Covered Corridors for walking exercise are also objected to by some; but, if they are very freely ventilated, they are useful in wet weather, as there is no special advantage in letting a phthisical patient get wet. Where there are pine woods, however, a much better walk can often be afforded under this natural shelter. There is an increasing tendency to keep patients away from the building during the day, and if the grounds are of the right kind this is by far the best way.

In the treatment of consumptive patients we should try to reverse the usual conditions of town life, and instead of spending twenty hours out of twenty-four in an ill-ventilated set of rooms, we should make our patients spend the night in the airest of rooms and the rest of the time out of doors, and should plan the details of the sanatorium in accordance with such a purpose.

Jane Austen's House at Bath.—Another of the series of tablets which the Bath Corporation are placing upon houses of historic interest in the city was unveiled on Thursday. This was on the house once occupied by Jane Austen. The ceremony was performed by the Rt. Hon. E. R. Wodehouse, M.P.

Collapse of a Roof.—The roof of the Siemens' department of the Dowlais Steel Works, collapsed on Tuesday, last week, whilst the men were in the act of repairing it and fixing up a girder. Seven men were injured.

The Death of Mr. A. G. Thomson, Engineer, occurred on Tuesday afternoon, last week, at his residence, Red Court, West Ferry. Deceased, who was the only son of the late Mr. William Gordon Thomson, of Fairfield, Broughty Ferry, was a partner in the well-known firm of Messrs. Thomson, Son, and Co., engineers and ironfounders, Douglas Foundry, Dundee. He also carried on the successful business of the Clepington Spinning Company.

Devon and Exeter Architects' Society.—The members of the above society had an interesting excursion to Dunster and Cleve Abbey on the Saturday before last. Dunster Church, with its beautiful oak carved screen work, was first visited, and then the party was conducted over the Castle; its old masonry, ancient charters with the seals attached, carved oak, the bed which was slept on by Charles II. with the secret hiding place in the wall, the room occupied by the Prince of Wales when a guest, old paintings, and the rare painting on leather, ponderous matchlocks and relics of sieges being inspected with much interest. The members were afterwards entertained at luncheon by the ex-president, Mr. J. Crocker, at the Luttrell Arms, after which they were driven to Cleve Abbey.

Views and Reviews.

ARCHITECTURAL PHOTOGRAPHS.

Messrs. S. B. Bolas and Co., the well-known architectural photographers, of 77, Oxford Street, W., have hit upon a distinctly happy idea. They have prepared a comprehensive series of views of Westminster Abbey which they are publishing in twelve shilling packets each containing eight or nine collotype prints (half-plate size). We have never seen finer examples of architectural photography, and the extremely low price at which they are offered will, no doubt, command a sale large enough to justify the publication—which, we understand, is in contemplation—of other sets descriptive of other cathedrals. Good architectural photographs have a genuine educational value; one cannot, of course, study architectural features from photographs so well as from the building itself, but such photographs as these afford the best available substitute for a personal visit. We reproduce, on a slightly reduced scale, the photograph of the Confessor's Chapel which forms one of the second series, but it should be said that in the reproduction there is some slight loss in respect to the sharpness of detail.

SOUTH KENSINGTON STUDENTS AND THEIR WORK.

This book is published with the intention (to quote from the preface) of providing the Art student "with matter for thought and with a practical demonstration of the thoughts and work of others, and further with a guide to what the examiners of the Department of Science and Art require, if the student desires to attain success under their examination." To judge from the work now on view at South Kensington, other Art masters have also had the intention of providing their students with counsel of a similar description and have been very successful in divining the examiners' likings, several schools having gained quite a shower of honours in the shape of medals and book prizes. And the occurrence of certain names is frequent upon the premiated drawings, showing that individual students have also been similarly successful, though this may partly be accounted for by medals being sometimes given for a set of several drawings.

It is curious how small an influence the traditional historic styles of ornament appear to exert upon the drawings and designs produced by students nowadays; they are quite emancipated, and to judge from what is now on exhibition, the clever student is not aware that great things have been done in past ages. Not that the work is any the more original for that, it is only that the type chosen for imitation is different. Certain foreign books to be found in the Art Library have been largely drawn upon, and the work of three or four clever men of the present day has furnished the stimulus for most of the rest of their efforts. It is, perhaps, unfair to complain of young students' work being an imitation of something which has impressed them—one begins by imitating—but it is among fresh young minds that one expects to see invention, and certain of the drawings are the work of students who are already making a good income by the exercise of their talents, and really should scarcely compete with students pure and simple. (One student at least, who has had silver medals awarded this year, gained a gold medal two years ago.) It is the system of payment by results which forces masters to watch the opinion of the examiners, as shown by each year's awards, and do their best to satisfy it—the race between the examiner and the coach which is so characteristic of the present day—and which causes them to produce such books as this one.

The reproductions are well made on the whole, though slovenly printing here and there makes some of the smaller drawings unintelligible, and as one turns over the pages one comes every now and then upon a design which strikes one as practical; this is specially the case in the designs for lace and textiles. The student has not generally the advantage of having his designs reproduced, and therefore loses the teaching of necessity. Many of these drawings which look well enough on the page, and were considered worthy of medals, are quite useless for manufactures, because the effect of the repeat has not been sufficiently realized, and the processes are not understood. Extravagant ideas often occur to the student, and he develops them; this is one of the places where the counsel of the master should be of use. For instance, on page 70 is a design for a pulpit; the exterior is panelled, and the panels are filled with subjects. Facing the congregation is an upright panel, which is filled with a well modelled figure of a nude woman with her hair arranged in a strange fashion, suggesting Astarte. Even supposing that she is intended to symbolize the naked Truth, it does not require much reflection to convince one that a storm would arise in any church or chapel in which it might be placed—that it is, in fact, unsuitable for the purpose for which it was designed. This is, of course, an extreme instance, and it is not intended to suggest that many of the designs fail to anything like the same extent. Another case in which the counsel of the master would be valuable is when the motive of the design is a contorted and involved group of lines, with its counterpart, an affected simplicity of arrangement. The passion for these arrangements is passing, and it would be a mistake for students who have their living to get by designing for manufacturers to imitate the style of design which has found most favour with the examiners of late years. For the purpose stated in the paragraph quoted from the preface this book may probably be useful, but some of the mannerisms with which it is filled are already obsolete, and others are fast becoming so—in the world outside the examination rooms.

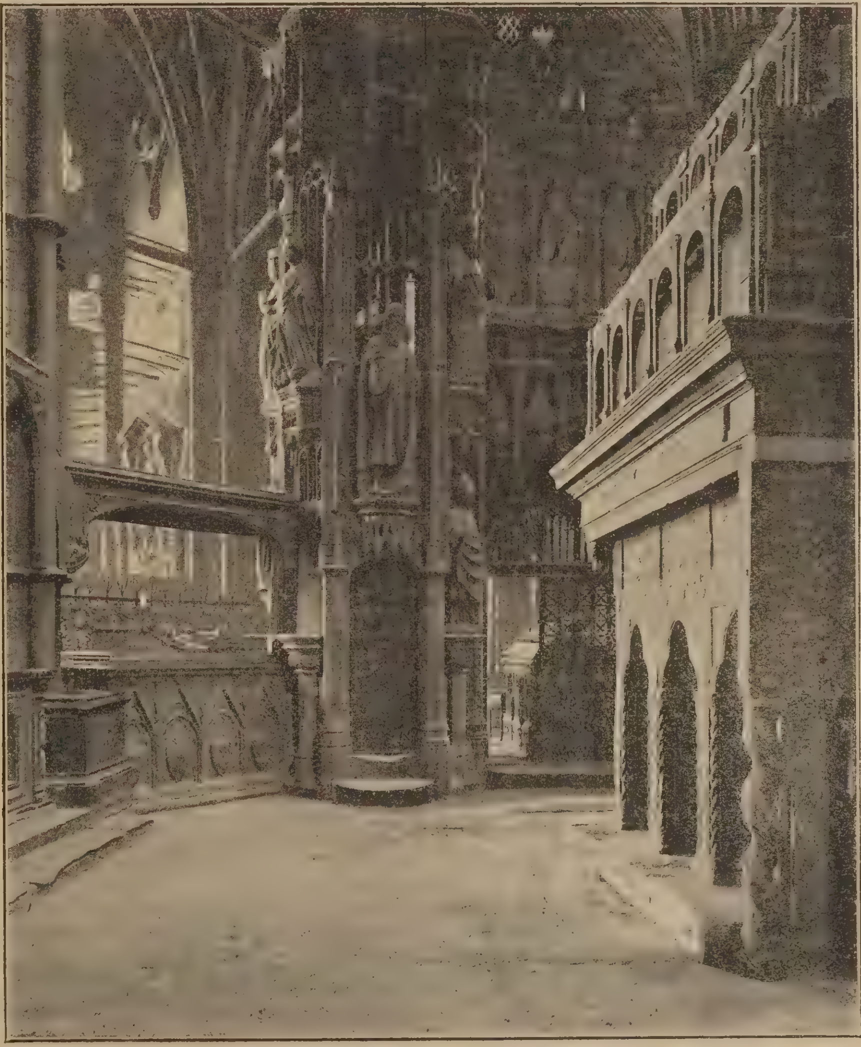
"National Competitions, 1896-97." An Illustrated record of National gold, silver, and bronze medal designs, models, drawings, &c. Edited and compiled by JOHN FISHER, Headmaster, Kensington School of Science and Art, Bristol. London: Chapman and Hall, Limited, 1899.



THE CONFESSOR'S CHAPEL AT WESTMINSTER ABBEY.

DISPUTED POINTS UNDER THE LONDON BUILDING ACT.

BY GEORGE H. BLAGROVE,

Certificated Surveyor under the Act; Author of "Dangerous Structures," "Shoring and its Application," &c.

(Continued from page 71, No. CCXXXIX.)

II.—OPEN SPACES ABOUT BUILDINGS.

THE monetary value of building sites is largely affected by Part V. of the Act which regulates the heights of buildings and the open spaces about them. Private speculators, advised by agents and auctioneers who are ignorant of the Building Act, have often been persuaded to purchase sites in London, and have found out, when too late, that the Act would not allow them to build to the extent contemplated, and that therefore they could not obtain a sufficient return for the capital invested. In such cases serious losses may be incurred. The way to avoid them is to ascertain, before purchasing a site, all the conditions to which it may be subject. If the intention is to remove an existing building and erect a new one of greater magnitude, this can scarcely ever be done without the special consent of the London County Council. Such consent should be obtained, if possible, before the site is purchased or taken upon lease. It is very difficult, in most cases, to pronounce an opinion as to whether the consent is likely to be granted or refused. It may be granted in one case, and refused in another, when there appears to be but little difference between the two. I do not wish to imply that the decisions of the Council are inconsistent; but they may appear so to those who do not know all the circumstances of every case.

The open spaces in the rear of buildings, as provided under Section 41 of the Act, constitute a great benefit to the people of London who are by no means suffering from a superfluity of fresh air. In streets formed after the commencement of the Act, the open space is (except in certain cases) to commence at the level of the pavement in front, or of the ground at the rear boundary, whichever is higher. This provision, however, is not likely to take effect in new streets formed in the heart of London, where builders usually avail themselves of Section 43, which allows them to rebuild upon sites previously occupied. It is in suburban localities that Section 41—1 operates in securing many a patch of ground against future encroachment.

Section 41 as applied to Alterations of Buildings.

There exist in London many old buildings which are not constructed in accordance with Section 41 of the present Act. When it is proposed to alter or add to such a building, regard should be paid to Section 209, which provides that alterations or additions shall, to the extent of the work done, be subject to the provisions of the Act, and of by-laws thereunder relating to new buildings. A section from front to back of the existing premises should therefore be drawn, with the horizontal line and the diagonal line, as directed in Section 41, the former line being drawn at 16ft. above the pavement level. Then no new addition can be erected above the diagonal line, except such chimney stacks, dormers, &c., as are allowed under Section 41—1 (iii.) (*e*), and a w.c. and ash bin within 9ft. above the horizontal line.

If the builder wishes to make some new addition above the diagonal line, he must apply for the consent of the London County Council. The application must be accompanied with plans showing the existing building and the proposed addition. The plans of the existing building need not be certified by the district surveyor, because their accuracy can be tested by comparing them with the actual building. The builder, however, should be careful not to take down any portion of the building that may already exist above the diagonal line until after the required consent to rebuild has been obtained. Plans of the existing building, certified by the district surveyor under Section 43, may be of use for purposes of evidence in a court of law; but it appears that they do not avail for purposes of applications to the Council in cases of alterations or additions, because Section 43 commences with the words: "When any person intends to erect a domestic building, &c."; and there is no reference in the Section to alterations or additions.

Not long ago, an attempt was made to apply Section 43 to a case of alterations and additions. Plans of an existing building were prepared, and were duly certified by the district surveyor. Plans showing proposed alterations were also prepared, and the Council were asked to sanction these, as deviations from certified plans, under Section 43. But the applicants were officially informed that, as it was not the intention "to erect a domestic building," but only to alter an existing one, the matter was not one which could be the subject of an application under Section 43.

Can Portions Existing above the Diagonal Line be Taken Down and Rebuilt?

As it appears that Section 43 is not applicable to cases of alteration or addition, the question suggests itself, under what Section of the Act can part of a building, which is above the diagonal line, be taken down and rebuilt, without the special consent of the Council? It may well be argued that a principle which applies to the whole of a building ought to be applicable to any part of it; but it is doubtful whether a question in statute law can be settled in this way. It appears to me, that to take down part of a building is to commence an alteration; and Section 209 provides that alterations shall be subject to the provisions of the Act. Section 50 allows a topmost storey to be raised so far as is necessary to bring any habitable rooms existing therein into conformity with the provisions as to habitable rooms. But, with this exception, I do not know any Section that provides for the re-erection of a portion above the diagonal line, after it has once been taken down. It would be well if there were some authoritative decision upon this point.

Rebuilding According to Certified Plans.

Section 43, when it is applicable, appears to relieve a builder from the necessity of complying with the preceding sections in Part V., but not to relieve him in regard to subsequent sections. It cannot, for instance, invalidate the rules as to habitable rooms in Section 45; and, of course, it does not affect the rules in Section 70, which belongs to Part VI. Nor does the permission to rebuild in accordance with certified plans carry with it the right to reconstruct a roof formerly existing at a steeper angle than 75deg. Section 50, indeed, allows the height of a building to be increased, so far as to allow of habitable rooms in the topmost storey. This would admit of steepening the pitch of the roof sufficiently to obtain a height of 8ft. throughout, not less than one half the area of each room, but it would not admit of making the roof steeper than 75deg. Anything beyond these modifications, in rebuilding from certified plans, would appear to be a deviation requiring the sanction of the Council.

What is a Deviation?

It was contended, in the case of *Paynter v. Watson*, that an increase of height (beyond that allowed under Section 50) in rebuilding from certified plans would not be a deviation within the meaning of Section 43 (i), which provides that the intended building shall be erected "so that no more land shall be occupied by the newly erected building than was occupied by the previously existing domestic building as so certified." It was contended that, as no more land was intended to be occupied than formerly, there would be no deviation requiring the sanction of the Council. On the other hand, it was pointed out that, under Section 43 (ii), if the person erecting the intended building "shall desire to deviate *in any respect* from the plan or plans certified by the district surveyor," he must apply to the Council; also that (Section 43 (i) the plans to be certified were required to show the extent of the previously existing building "in its several parts." But again, it was contended that the only plan required by the Act to be certified was a plan showing the extent of the previously existing building in its several parts on the basement. Thus the case really turned upon what were the plans required to be certified, from which no deviation was permissible without the sanction of the Council.

The decision of the High Court was, that the plans to be certified were not confined to ground plans or basement plans, but included plans showing every part of the building in every direction in which it extended. The conclusion to be drawn from this decision is, that plans to be certified should show the extent of the original building as completely as possible; for if there is any part which is not shown, or which cannot be reconstructed from the certified plans, such part cannot have the benefit of Section 43, but must be rebuilt in conformity with other provisions in Part V.

Can the Council Refuse to Sanction Deviations?

It does not appear that Section 43 empowers the Council to sanction a deviation which would be in contravention of any other part of the Act. But suppose a deviation to be in conformity with the Act, except as regards Section 41; can the Council refuse to sanction it under Section 43?

The wording of the Section is sufficiently clear (ii.): "If a person erecting the intended domestic building shall desire to deviate in any respect from the plan or plans certified by the district surveyor, it shall be lawful for him to apply to the Council, who SHALL sanction such deviations on such conditions as they may think fit, &c." It would appear that the deviations are to be submitted to the Council in order that they may impose conditions. A condition cannot mean a modification of a proposed plan. It would be impossible for the Council to sanction a deviation on condition of its being modified, because that would not be sanctioning the deviation. The conclusion to be drawn from the wording of the Section quoted above is, that the Council are not intended to withhold their sanction, although it may be desirable that they should have the power to do so.

(*To be continued.*)

New Patents.

The following abridged description is specially drawn for The Builders' Journal and Architectural Record *by Messrs. Hughes and Young, Patent Agents, 55 and 56, Chancery Lane, London, W.C., who will give advice and assistance free to our readers on all Patent matters.*

4220. Ornamenting Walls, Columns, Mouldings, &c.—Patentee: J. J. Kayll, of Promenade Square, Harrogate, Yorkshire. Coloured enamels are painted on the smooth ground or sand-blasted backs of opal glass facing tiles, and are burnt in by placing the tiles in a kiln or furnace. The tiles are arranged to form suitable designs or figures, and are cemented to walls, columns, mouldings, &c.

4418. Tiles, Roofs and Walls.—Patentee: C. L. A. Janoyer, of Rue de l'Eglise, Taverney (Seine et Oise), France. Undercut ribs under the tiles interlock with dovetail wood battens or bent plates. The upper edges of the tiles are formed with ribs or outstanding flanges to prevent the entrance of water past the joints, and the wood battens are rabbeted to receive the outstanding flanges of the lower tiles.

302. Window Shutter Fastenings.—Patentee: A. R. Hayward, of West Chinnock, Ilminster. A fastener for window shutters consists of a pin secured by a plate to the window frame, and slotted to receive a tongue pivoted. The shutter has a plate with a central aperture, and when closed over the pin the tongue falls down and prevents the shutter being opened from the outside.

Proposed Roman Catholic Church at Bearwood.—A committee which was appointed some time ago, to acquire land in the neighbourhood of Bearwood suitable for the erection of a Roman Catholic church and schools, have received an offer for the purpose from an anonymous donor of land of the estimated value of £1,000. The site is in the Lightwoods and Three Shires Oak Roads.

A Handsome Ptolemaic Column is in course of erection at Alexandria to commemorate the victory gained by the Anglo-Egyptian forces in the Soudan last year. The monolith was recently hoisted on to the pedestal before a distinguished gathering of local celebrities. The monolith is of massive red granite, and was excavated from the old ruins at Alexandria it weighs twenty-five tons, is 34ft. long and 3ft. 6in. in diameter. The height of the monument, when complete, will be 60ft. The excavations and the erection of the monument were due to the energy of Tchiess Bey, the Government hospital doctor, who erected a similar column in memory of the Queen's Jubilee.

Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor.

A BOOK ON BRICKLAYING.

To the Editor of THE BUILDERS' JOURNAL.

FULHAM, S.W.

SIR,—I should feel obliged if you could inform me which is the best book written on bricklaying for a beginner.—Yours, &c.,

J. B. S.

The only book of the kind we know of is "The Rudiments of Practical Bricklaying," by Adam Hammond, price 1s. 6d. This can be obtained from Mr. B. T. Batsford, of 94, High Holborn, London, W.C.

A GROUND OF ERMINE.

To the Editor of THE BUILDERS' JOURNAL.

GREAT YARMOUTH.

SIR,—A few weeks back you very kindly gave me some valuable information *re* a certain coat of arms. Will you now tell me whether the ground of "ermine" should be white or silver.—Yours, &c.,

GREY-FRIARS.

Ermine in heraldry is blazened *argent* with *sable* tails, *i.e.*, the ground is white with the conventional black spots. Silver should be represented as white on a pointed shield, or as a plain ground in sculpture and engraving.—G. C. R.

QUANTITY SURVEYING CLASS.

To the Editor of THE BUILDERS' JOURNAL.

WALHAM GREEN, S.W.

SIR,—As a constant reader of your journal, I shall be obliged if you will inform me what would be the best and most practical evening classes on Quantity Surveying you would advise joining, due regard being given to the economical side of the question.

W. F.

There are good classes at King's College, City of London College, and University College. We should advise our correspondent to apply for the prospectuses and see which class would best meet his convenience.

BOOK ON MECHANICS AND PHYSICS.

To the Editor of THE BUILDERS' JOURNAL.

NORTH SHIELDS.

SIR,—Would you kindly give me the name and publishers of a book on elementary mechanics and physics, suitable for the preliminary R.I.B.A. exam. Yours truly,

W. S.

We would advise our correspondent to get William Briggs' "Elementary Text Book of Mechanics," published by W. B. Clive, price 3s. 6d.; and Professor Balfour Stewart's "Lessons in Elemental Physics," published by Messrs. Macmillan and Co., price 4s. 6d.

A HANDY BOOK ON CARPENTRY.

To the Editor of THE BUILDERS' JOURNAL.

WOLVERHAMPTON.

SIR,—What book do you recommend as most suitable for small jobs, repairs, &c.—Yours, &c.,

J. R.

It is rather difficult to advise you as to what would be the best book for your purpose without knowing something further of your requirements. Probably, however, Tredgold's "Carpentry," published at 25s. by Crosby, Lockwood and Son, would best suit your purpose. The same firm publish a useful little handbook called "The Woodworker's Handy Book of Manual Instruction," at 1s.

SETTING OUT AN IONIC CAP.

To the Editor of THE BUILDERS' JOURNAL.

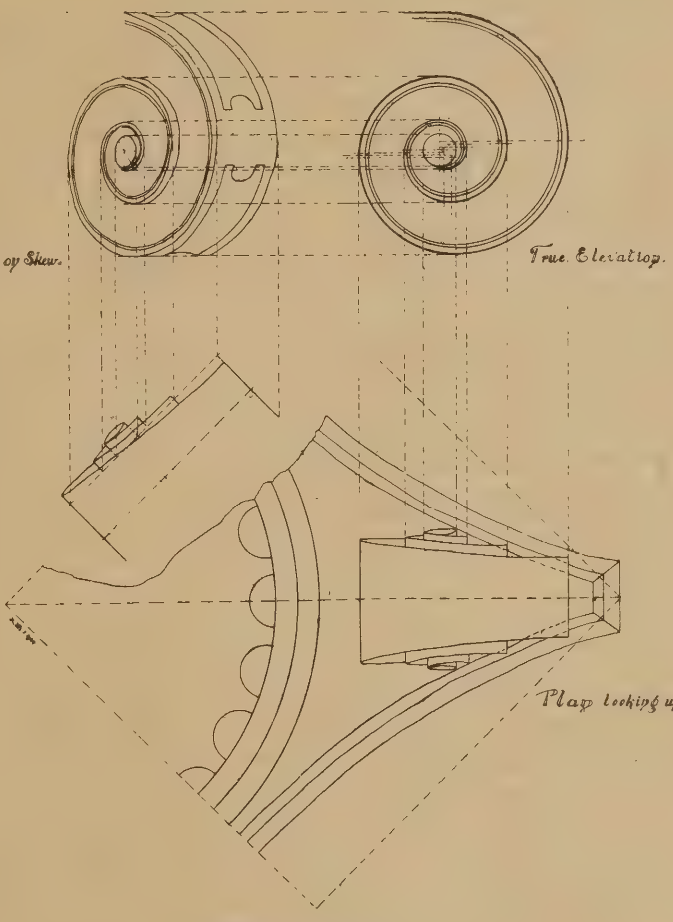
MANCHESTER.

SIR,—Would you kindly, through the medium of your paper, give me a simple and yet correct way for the setting out of an Ionic cap, that would be of use in the full detailing of same in the drawing office, giving both plan and elevation.—Yours, &c.,

H. B.

The drawings on this page will illustrate the method of drawing the volute in foreshortening. First the plan is laid down and the volute drawn out in correct elevation (by Goldman's method in this case). Then the plan is again drawn at the required angle, and the lines are projected up, meeting the corresponding lines projected from the elevation, thus fixing the required points. The volute can then be drawn in by hand.

R. W. C.



SETTING OUT IONIC CAP.

GYPSUM.

To the Editor of THE BUILDERS' JOURNAL.

STOCKBRIDGE.

SIR,—Answers to the following questions would be of great service to me, and, doubtless, instructive to many other readers of the BUILDERS' JOURNAL:—

1. Is gypsum used for any other purposes besides making plaster of Paris?
2. Where is gypsum obtained? And what is the production of gypsum in England in the last decade?
3. What is the best way of using plaster of Paris when casting in gelatine moulds?
4. Is there any profitable way of using old plaster?

STUDENT.

1. Gypsum is used by brewers in some districts to soften the water used for making beer. A coarse kind of gypsum is also used as a fertiliser in districts where the raw material is cheap.

2. Alabaster or gypsum, the hydrous sulphate of lime occurring in the massive form, is largely used in the manufacture of plaster of Paris, for which there is a large demand, not only in the arts generally, but also in the Staffordshire potteries for the purpose of making moulds, a use which has gained for alabaster the name of "Potters' stone." It also forms the basis of stucco and certain kinds of cement.

Gypsum occurs in seams, veins, and nodules in the Kenper marls in Cumberland, Nottinghamshire, and Staffordshire, as well as in Derbyshire, Westmoreland, and Somerset. In Sussex gypsum is obtained from the Purbeck beds, reached near Battle in the sub-Wealden exploration boring, and it is found in similar strata at Swanage, in Dorsetshire.

The total production of gypsum in England for 1897 was 181,385 tons, valued at £66,978. The output has been steadily increasing since 1881, the largest amount being supplied by Nottinghamshire and Staffordshire. Although mostly obtained from mines, the whole of the gypsum raised in Somersetshire is from open quarries near Watchet.

3. Plaster of Paris—known in the trade as "plaster"—is used in various forms when casting in gelatine moulds. For small enrichments, such as bedmoulds, it is simply gauged with pure water; but for large enrichments such as large cones, friezes, &c., the plaster is gauged with water containing a small percentage of liquid alum which accelerates the setting of the plaster and enables the cast to be extracted from the mould before the heat, generated by the plaster, softens the face of the mould and spoils the cast. For extra large casts which are generally made with fibrous plaster, the seconds are usually gauged with water containing a small percentage of size-water, which delays the setting of the plaster and enables the workmen to lay and brush the scrim and wood laths which are used to strengthen the casts.

4. Old plaster, in large quantities, may be profitably used for the manufacture of parian cement, provided the plaster does not contain any lime or lime water, which is sometimes used to prevent the plaster swelling.

W. MILLAR.

MODEL ANSWERS TO EXAMINATION QUESTIONS.

Answers to Questions set in the Examination held by the Society of Architects in April, 1899.

BY G. A. T. MIDDLETON AND R. W. CARDEN, ASSOCIATES R.I.B.A.

(Continued from page 74, No. CCXXXIX.)

III.—ARCHITECTURAL HISTORY.

(Part III.)

8. *Describe, with sketches, one of the following buildings: Constitutional Club, London, Imperial Institute, Natural History Museum.*

(Of course in answering this question and the last, the candidate who was well acquainted with the Constitutional Club would have a decided advantage over other competitors, for he could contrive his answers so that half his answer to No. 7 would answer nearly all that was required for No. 8. This appears to have been an oversight.)

The Constitutional Club.—This has already been described as part answer to the last question (see Part II.), but in this instance sketches are asked for as well.

The Imperial Institute was the outcome of the Jubilee of 1887, and was won in competition by T. E. Collcutt, Esq.

Its elevation is divided into five portions—centre and wing pavilions highly ornamented, and intermediate portions subordinated. The chief entrance is in the centre and spanned by a rather low arch, giving emphasis to the internal height as one proceeds up the broad steps. Above the entrance is a balcony of four bays, the abutments of the end arches being slightly projected and carried up till they break into octagonal turrets with lesser similar turrets at their angles. Over the arcade and between the turrets is a steep pointed gable.

Behind this—marking, as it were the "crossing"—is the enormous tower, absolutely plain, except for small windows, until the belfry stage is reached. Here there is a bold cornice, and above it double windows in each side and ornate flying buttresses at the angles to take the thrust of the cupola.

The wing pavilions are flanked by octagonal turrets with steep gables somewhat as described above.

The ground stage of the other two portions consists of a broad loggia in four bays; and each bay is marked off in each of the other floors by pilasters. These bays are crowned by gables.

The Natural History Museum, South Kensington, is one of the works of Alfred Waterhouse, Esq., R.A. Its style is Romanesque.

The entrance is a broad and deeply recessed round arch in five planes, and is surmounted by a flat gable containing two tiers of windows. This gable is flanked by towers pierced with windows in each stage, the uppermost storey being octagonal and crowned by a steep roof, with pinnacles at the angles.

The main portions of the building are recessed back considerably and consist of a long and rather low range of eleven arcades. It is difficult to describe this, but perhaps it is permissible to say that the centre block is flanked on each side by a "nave" of eleven bays. Each bay is delimited by pilaster buttresses running through ground and first floors, and being terminated by wild animals or birds, symbolical of the uses for which the building is intended. The ground floor windows consist of two lights under a square head in each bay; the first floor windows are also of two lights coupled under round arches. Two-light dormers give light to the second floor.

The end pavilions are to a certain extent repetitions of the "nave," but of two bays each only, the pair flanked by boldly projecting buttresses. Above the first floor is a range of five windows surmounted by a parapet, above which the building becomes octagonal and is crowned by a steep roof.

9. *Give a section of the Pyramid of Cheops, and a short description of its construction, dates, &c. Or:*
Give plan and elevation of the Tomb of Darius, at Naksh-i-Rustam. (This and the following questions were voluntary.)

The Pyramid of Cheops (or Suphis) is one of a group of three erected at Gizeh, near Cairo, and belongs to the 4th dynasty—probably about the year 3700 B.C. It is almost a square on plan, of 760ft. sides, the sides meeting in a point at the summit (480ft. high). It consists of an enormous mass of limestone, once cased with red granite, which did not follow the slope of the sides, but diminished in courses, or steps; of these steps there were 203 varying considerably in height. It was built for the King as a tomb that should last for ever, and that should keep the bones of the monarch hidden completely from the eye of humanity. For this purpose the entrance was made by no means direct. The portal is placed at a considerable height above the ground, and the passage therefrom leads steeply downwards to a chamber far below the surrounding land. At a point in this passage, just within the mass of limestone, rises another passage, an imaginary horizontal line almost bisecting the angle between the two corridors. This second passage leads straight up to the burial chamber, and about half-way up its height two other passages open out, one of them leading horizontally to a chamber (called the Queen's Chamber, though no queen was ever buried there), and the other being a rough hewn tunnel zigzagging down until it reaches the first (or entrance) passage, at a point slightly above the lowest chamber.

The principal galleries (or passages) are lined internally with huge blocks of granite, worked with the most admirable precision and truth of surface. The constructional expedients employed in order to make crushing by the superincumbent mass an impossibility are equally wonderful. Each course in the walling of the galleries projects until the space is sufficiently narrow to admit of being spanned by a single slab of granite. The royal chamber, which was guarded by a granite portcullis, is a rectangular apartment, ridiculously small when compared with the vast extent of the pyramid that contains it. Above is a series of four chambers, apparently only formed as another means of protecting the royal remains from being crushed. The final expedient for distributing the load is an arrangement of two slabs of granite abutting at an angle of about 35deg. It would be impossible to suggest any improvement upon this construction, even with our present knowledge of iron and steel work. An arch might conceivably be crushed, and a single slab would probably give way under the load; but these sloping slabs, each with several thousand tons of abutment, may well last for ever.

10. *Describe, with plan, section and short description, the Church of St. George, at Thessalonica; or, give similar description of the Mosque of Cordova.*

(The wording is copied accurately from the set of questions, and shows that no great care was bestowed upon the preparation of the paper. This would probably account for its unusual severity.)

The Church of St George at Thessalonica is built with all the characteristics which the Romanesque (?) style developed in the east. In plan it is a simple circle with a small projection at (presumably) the east. The walls of this circular structure are 20ft. in thickness, pierced by eight great semi-circular arches, one of them being larger than the rest and giving access to the addition spoken of above. It is surmounted by a hemispherical dome, the drum of which is pierced by eight semi-circular openings. The shell of this dome is thinnest at the crown, and the outward thrust at the springing is rendered more vertical by the superimposed solid wall whose only duty is apparently to carry a light wooden roof. Internally it is decorated with mosaics which probably date from about 400 A.D., though there is nothing by which an exact date may be arrived at. The outside is as plain as it well could be, and has on one side a slender minaret as at Sta. Sophia at Constantinople. We have described this church as eastern Romanesque in deference to the various text books on the subject. Our own conviction is that it is purely Byzantine, for the following reasons:—It is circular on plan, arcaded into eight bays: this certainly recalls the Byzantine octagonal baptisteries. It is domed, the dome being filled with mosaics: as at Ravenna and elsewhere. It has a minaret attached to it: this is also an accompaniment of Sta. Sophia, Sant. Antonio, Padua, and other churches—all Byzantine.

The Mosque at Cordova was commenced in 786 by Abd-el-Rahman. It is an enormous rectangular building 420ft. by 375ft.; its height, however, is in great contrast, being not more than 30ft. Internally it is divided into thirty-three aisles in one direction, and into eighteen in the other, the columns supporting originally an elaborately carved and painted roof. This has been removed and a brick vault put up in its place. The majority of the columns were taken from the ruined Roman cities of Spain, and this may account for the lack of height, the height of the order being governed by the length of the columns found. Even the builders themselves realised this great failing and sought to solve the difficulty by putting arch over arch (see section) in the most elaborate profusion. The sanctuary, built in 965 A.D., is still more elaborate. It seems that in this building Byzantine artificers were employed frequently, though not entirely, the architectural style being purely Moorish.

"Restoration" of Old Churches.—W. H. J., in writing to the "Morning Post," makes a suggestion that museums should be established in each diocese to receive relics, such as old fonts, pews, &c. These should not be sold or thrown away as at present when removed for the purpose of giving room for some memorial, and a severe penalty, he suggests, should be inflicted on all who disregarded this rule.

A New Congregational Church at Barry, the memorial stones of which were laid on Wednesday, is to be erected, at a cost of about £6,000. Accommodation will be provided for 750 persons. At the northern front will be erected a tower, surmounted by a tall spire. The main portion of the building will be of red brick, with Mansfield stone facings, and on the interior will be a gallery running round, space being reserved for an organ loft, while beneath will be provided the usual church offices.

New Organ at Dewsbury.—Messrs. Abbott and Smith, of Leeds, have just completed a fine organ for St. Philip's Church, Dewsbury, and it will be opened shortly by Mr. S. Pilling, of the Hagg, Mirfield. The instrument comprises great, swell, and pedal organs, with couplers, as follow:—Great: Large open diapason, 8ft.; small ditto, 8ft.; hohl flute, 8ft.; dulciana, 8ft.; principal, 4ft.; harmonic flute, 4ft.; and posaune, 8ft. Swell: Lieblich bourdon, 16ft.; violin diapason, 8ft.; lieblich gedact, 8ft.; viola, 8ft.; voix céleste, 8ft.; gemshorn, 4ft.; horn, 8ft.; and oboe, 8ft. Pedal: Open diapason, 16ft.; bass flute, 8ft.; and bourdon, 16ft.

Popularity of Pictures.—Mr. Councillor Alden, M.A., has now reported on his examination of the returns of the voting on the pictures exhibited at the recent picture exhibition at West Ham. The most popular picture appears to have been "Christ the Consoler," by Rudolph Blind, which received 733 votes at Canning Town, and 1,158 at West Ham. The second picture on the voting list, both at Canning Town and West Ham, was "The Gambler's Wife," by Marcus Stone, while the third was Lady Butler's "Inkerman," the voting for which was 370 at Canning Town, and 746 at West Ham. Statistics prove that these exhibitions have been better patronised than any similar exhibitions in the whole world.

ILLUSTRATING ANSWERS TO EXAMINATION QUESTIONS 8 TO 10.

Correspondence.

SPOILING THE OLD COLLEGE AT BROMLEY.

To the Editor of The Builders' Journal.

Catford.

Sir,—I should like to draw your attention to the action of the trustees of the old college at Bromley, Kent, which is removing much of its old beauty. The college was built in 1666 and the red bricks and tiles have assumed a very rich red colour, but owing to the advice of the architect (or more truly, I believe—surveyor) they have resolved to remove the old tiles, and substitute modern machine-cut ones of a lighter tint. On the authority of the chaplain, I may say that there has been no complaint of leakage, the tiles serving their purpose perfectly well. The tilers have already begun their work, and one side of the first quadrangle is almost finished, with what effects may easily be imagined. Is there not any means by which pressure could be brought to bear on those in authority when the harmonious and striking beauties of such a place are at stake? If anything can be done it ought to be done at once as there is no time to lose. The chaplain has done all he could to bring his influence to bear but it has been in vain. Of course, I am only an outsider, but should very much like to know if anything could be done to check such wanton change.—Yours, &c., W. H. TODFER.

IS OUR EXAMINATION SYSTEM A FAILURE?

To the Editor of The Builders' Journal.

Dear Sir,—Having had a fairly large experience in examinations, it has struck me that our examination system does not show which student is the best. Certainly the examination shows which student is most capable of answering the questions set, but when we remember how the students have been prepared for the examination we must acknowledge that the system is far from perfect. Some of the chief causes of the failure are, to my mind, as follow: The examiner is seldom a practical man, being often only qualified to set the questions because he has distinguished himself in such a way as to bring himself to the notice of the authorities who appoint the examiners. The questions set are such that can be answered from the text book, and do not give the candidates an opportunity to exercise their common sense, or, rather, to think out a solution for themselves; one frequently meets with such opportunities in practice but seldom in examination, and it must be remembered that the possession of a retentive faculty by no means implies the possession of a creative one. By a careful study of past examination papers it is possible to guage the kind of question likely to be set. Teachers by these means often base their course of study on that which suits the particular examiner, instead of generally educating the pupils in study of the subject they are dealing with; beside this, the examiner is often the author of a text book, the perusal of which improves the candidate's chance of success by enabling him to answer the questions set so as to suit the examiners' fancy. Not that I mean to imply an unfairness on the part of the examiners, but, of course, they have their own notions of the way a question should be answered, and if a candidate can see what an examiner desires he is likely to put that answer to gain higher marks. I would suggest that questions be set to test the candidate's thinking powers so that even if he has not met with the problem set before he must tackle it with his knowledge gained previously in similar cases added to his reasoning powers. Many clever men at examinations find themselves left behind when compared with less brilliant men in the solution of everyday problems, and this fact alone lowers the value of many of the certificates obtained. The examiner should not be an author of a textbook on the subject he examines in, if another suitable man can be found. Again, more time should be given to do the work in than is usually allowed, so that a higher standard of answer could be expected, it being most unsatisfactory to allow candidates to "scrape through." Also, the student's knowledge should cover a fairly large ground, rather than run in a narrow channel, though, necessarily, the ground covered should not be too large, and, finally, common-sense, when exhibited, should be able to gain marks. These few alterations would, I think, improve the value of examinations, some of which, as they now stand, are merely "farces."—Yours truly,

K.

STONE CHURCH, KENT.

To the Editor of The Builders' Journal.

Kilburn, N.W.

Sir,—With reference to the enquiry in your last week's issue, perhaps the description of Stone Church (dubbed of old "The lantern of Kent") to be found in Sir Stephen Glynne's "Churches of Kent," may be of use to your correspondent.

There is also a fairly full account of the buildings in Murray's "Handbook to Kent."—Yours, &c. B. C. DEXTER.

To the Editor of The Builders' Journal.

Bromley, Kent.

Sir,—I am afraid "Enquirer" will find great difficulty in getting any book dealing with Stone Church, Kent, although Hasted's "County History" may give a short account of it, but this would probably be somewhat out of date. When writing his description, "Enquirer" will of course mention the fine example of the double plane of tracery in one of the nave windows. It is Early English, and dates from about 1245. I am under the impression that the church has been dealt with in the Kent Architectural "Proceedings," and would recommend "Enquirer" to approach the secretary of that society on the matter.—Yours faithfully, J. RUSSELL LASHBY.

To the Editor of The Builders' Journal.

Gravesend.

Sir,—A short account of this church by George Edmund Street, F.S.A., can be obtained for one shilling, from Canon F. W. Murray, The Vicarage, Stone, near Greenhithe.

H. VELLENSWORTH.

To the Editor of The Builders' Journal.

Sledmere, York.

Sir,—There is a work which may be seen at South Kensington Museum library and probably at other places, entitled "Illustrations of Stone Church, Kent," by Edward Cresy, architect, F.S.A., published by the Topographical Society, by H. Hooper, Pall Mall East, 1840. This work contains a good account of the church and is well illustrated.

JOHN BAKER.

To the Editor of The Builders' Journal.

Catford.

Sir,—There is a long article all about it in the "Builder" for February 11th, 1882.—Yours, &c., STANLEY TOWSE.

To the Editor of The Builders' Journal.

Liverpool.

Sir,—Stone Church associates itself with several important Kentish families, and more especially with those who have successively been the owners through some five centuries, of Stone Castle. In the last reign but one (Edward III.) of the period whose remains we have at present under our review, Sir John de Northwood held the castle, and about that time, or the previous reign, the second form of the Gothic, the Decorated, was displacing the Early English. This church was built in the place of an earlier one, founded probably in the Saxon times. In 995 we find Stone given by King Ethelred to the church, and see of Rochester, and the bishops often resided there afterwards. To that see the manor of Stone still belongs. In Stone Church we have a good deal of the trefoil, quatrefoil, rose, and other ornaments of the decorated Gothic.

The interior of the church exhibits another beautiful feature, tall and slender columns linked by light and elegant arches, dividing the nave from its two aisles. The chancel is seen through a single arch of a circular figure, which is so common in the early English style. A more flowing tracery prevails in the windows, especially in the large east one. Round the chancel runs a low range of trefoil beaded arches, in relief, springing from slight pillars of grey marble. The tower is extremely curious, for its scientific construction. In the nave and aisles it is open on three sides, which rest on arches, and, at the same time to give it stability, the fourth side is solid from the foundation of the earth, supported by two graduated buttresses of considerable strength and projection, and by two light and elegant flying buttresses that shoot directly athwart the north and south aisles. Such tact and precision are evinced in the design and execution of the tower, that it has been from the first, and is likely to remain, immovable and solid as any pieces of Gothic workmanship in the land. The chapel adjoining the chancel was built by a lord of Stone Castle in the reign of Henry VII.—Sir John Willshyre, Knt. Comptroller of the town and marches of Calais. He and his lady were interred under a rich altar, with an arched recess behind, where in addition to niches and other ornamental work there are a cornice of grapes and vine leaves, and the arms of Sir John and Dame Margaret.

In Gough's "Sepulchral Monuments" is engraved a remarkable piece of brass in Stone Church. Such memorials, we may take this occasion to observe, were but in very partial use before the middle of the present period; after that they became general among all ranks, were often extremely elaborate in point of ornament, and elegant in design. The brass in the chancel of Stone Church is laid in a slab in the pavement about 6ft. in length, and represents a priest in his canonical vestments, standing in the centre of a cross composed of eight trefoil arches, and adorned with vine leaves. The stem of the cross rises from four steps, and on it is a Latin inscription. Another inscription is on the scroll over the priest's head, and a third round the face of the arches.

Quitting for the present the fertile and pleasing subject of village antiquities, we can only give a pleasing glance to one feature that is occasionally presented to our notice, that is the ancient canopy over the rustic churchyard gate, beneath whose cover the dead are brought for interment. There is a similar canopy at Beckenham, in the same country with Stone. They were called "lich-gates," "lich" signifying a "corpse."

B. M. WAUGH.

[We are much obliged to our correspondents whose letters are printed above, and also to several others who have kindly furnished the same information. We shall give an illustrated article on Stone Church in our next week's issue.—Ed.]

Moss Side Baptist Church and Organ have been renovated, at a cost of about £350.

New Schools at St. Helens.—The foundation stone of new British schools in course of erection in Knowsley Road, St. Helens, was laid recently by Colonel W. W. Pilkington, V.D., J.P. The cost of the building of the schools is estimated at about £1,500, and when completed accommodation will be found for 800 scholars, to be apportioned as follows:—250 girls, 250 infants, and 300 boys.

St. James's Church, Torpoint, has been presented by Colonel Pole-Carew, C.B., with a beautiful chalice and patten, designed by Mr. G. H. Fellowes Prynne, F.R.I.B.A. The base, which is beautifully worked and engraved, has on one panel a raised figure of Christ on the cross. It tapers gradually up to the stem, which is of open work. The stem is divided into two parts by a knob, also of open work, which is studded with precious stones. The cup is enriched in the lower part with rays emblematic of heavenly love. The patten is plain, but the two together form a very handsome ornament.

Bricks and Mortar.

APHORISM FOR THE WEEK.

"*Without understanding genuine appreciation is impossible; without study, understanding is impossible.*"—SIR E. J. POYNTER.

Tate Gallery Extension. THE extension of the Tate Art Gallery is now rapidly approaching completion, and in about two months' time four of the new rooms will be open to the public. The new structure occupies an area slightly larger than the present gallery, and will contain nine picture galleries and one sculpture hall. The architectural features of the original building will, of course, be maintained in the additional block. It has not yet been finally decided what pictures shall have places in the new rooms, but it is pretty certain that the four rooms to be opened in two months' time will contain between thirty and forty of Sir Henry Tate's pictures, which are at present rather crowded together. Then there are half a dozen pictures purchased under the Chantrey bequest to be hung there after they have made a tour of the provinces, and it is also probable that many pictures—not portraits—painted by British artists during this century will be transferred there from the National Gallery. The new rooms being built represent the completion of the original scheme for the gallery, but the gallery, if it is to justify its title, as the National Gallery of British Art, will have to be extended in the near future. It is, therefore, time for the Government to secure sufficient land round it for this purpose. The Gallery, although out of the direct line of omnibuses, trams, and trains, has achieved a large amount of popularity; on an average 800 people visit the Gallery daily, and on students' day the attendance numbers 240. It is expected that the whole of the extension will be opened within the next six months.

The Forum Excavations. HUNDREDS of tons of earth have been removed from the site of the Basilica Æmilia, which is now almost entirely uncovered. In addition to the huge fragments of the inscription discovered last June, the bases of nine columns supporting the portico of the façade, have been brought to light, and the mosaic pavement of the interior has been cleared of the stones and rubbish with which it has been covered for the last thousand years. Part of the pavement had been destroyed in making a mediæval sewer, but part is in splendid preservation. As far as can yet be seen the front of the Basilica must have extended for at least 120ft., while its depth as far as hitherto excavated is about 80ft. Probably the original floor of the edifice ran back two or three times this distance, but for the moment houses and embankments bar the way to further excavations. The excavations along the Sacra Via are still giving good results, though they will have to be suspended for a while in order not to destroy the cart-road needed for carrying away the earth and rough stones removed from the other sites. The original mosaic pavement in the house of the Vestals has also been discovered. The ruins of this edifice were supposed to have been fully excavated some years ago by Professor Lanciani, but the discovery just made proves that the work was then done in an unscientific fashion, which left the most interesting part of the building still buried. The pavement lies some 3ft. below the level of what Professor Lanciani supposed to be the floor of the houses. A staircase built against one of the walls runs down to it. Part of the staircase was discovered by the former excavators, who, by simply following the steps downwards, might easily have come on the mosaic pavement. A similar pavement has also been discovered in a chamber of the house of the Vestals and another in the corner of the Domus Publica. Signor Boni has also discovered a portion of the massive and splendidly-built wall of the Domus Publica. In the Regia the remains of another altar and part of the mosaic pavement have also been discovered.

Signor Giocomo Boni. THE Italian Government have appointed Signor Giocomo Boni, Director of Archæological Excavations for the whole of Italy. Though the credit for having allowed the excavations at Rome to be carried on and for having provided most of the requisite funds belongs to Professor Guido Baccelli, Minister of Public Instruction, the actual scientific credit for all the discoveries made and for the admirable management of the excavations as a whole belongs to Signor Boni. Signor Boni is well known to British visitors to the Forum. He is a Venetian by birth, an architect by profession, a civil engineer by experience, and a poet by nature. One of the earliest pieces of work on which he was engaged was the restoration of the Doge's Palace in Venice, a task which he performed chiefly in accordance with the advice of Mr. Ruskin. He has since received a number of scientific commissions from the Ministry of Public Instruction, but none of such importance or interest to the world in general as that which placed him fifteen months ago in charge of the Forum. At first Signor Boni's instructions were to arrange the broken blocks and scattered fragments in the Forum, and considerable hostility is said to have been manifested by some of his superiors when it was known that he had ventured to make some minor excavations there. According to the wisdom of the archæological authorities fifteen months ago, the Forum had no need of being excavated, the work having been well and thoroughly done years back by Rosa, Lanciani, and others. Signor Boni, however, with the help of one or two faithful workmen, quietly began investigation. He came on the Rostrum of Julius Cæsar, then having found the true level of the Forum—a thing neglected by the former excavators — proceeded to discover the original Via Sacra and the Black Stone, with the ancient Latin inscription underneath, to delineate the real proportions of the Temple of Vesta, to discover the so-called Puteal Libonis, to find in the Regia a huge dry cistern used as a corn deposit, in which quantities of *stili* and Etruscan pottery were discovered, to discover the basis and a finely-decorated portion of the interior of the house of the Pontifex Maximus, and finally to complete the incomplete work of his predecessors by uncovering a series of mosaic pavements in the house of the Vestals. He has also carried out the gigantic excavations of the Basilica Æmilia.

Lincoln's Inn Gateway. THE Gate of Lincoln's Inn in Chancery Lane is now being restored, under the direction of Mr. Dennett H. Barry, surveyor to the Honourable Society of Lincoln's Inn. This is doubtless necessary and the restoration seems to be carried out in a proper spirit. The greater portion of the front of the Gateway consists of the work as actually laid during the years 1507-1518, when the gate was built; the typical small red brick of the Tudor period being varied with black vitrified bricks arranged in a lozenge pattern. Here and there, however, may be seen alterations in the original work, which date from the time when the British bond and Flemish bond were in use. Then, again, the brick of the top courses and parapet are of the larger size that came into use after the passing of the Brick Act, in the twenty-fourth year of George III., c. 24, which levied a duty of 2s. 6d. on every thousand bricks. It will be seen that the enlargement of the size of the bricks reduced the amount of duty payable, and their employment on the gate points to its repair at some date subsequent to the year 1784.

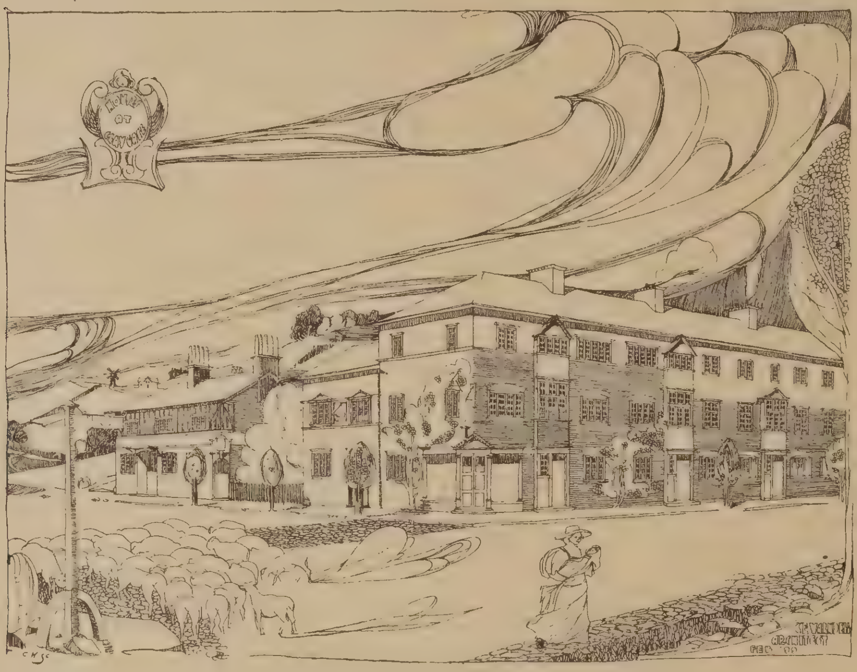
The Work to be Done. IT is this portion of the fabric, that which meets with most wear and tear from the elements, that is most in need of repair at the present time. About four feet of the stone coping and parapet walls of the towers facing Chancery Lane are to be removed and replaced with new material. The whole of the brickwork is to be re-pointed. It is to be hoped that this will not include scraping or washing over with the dirty red stuff very much in fashion nowadays. The whole of the brickwork is soaked with the grime of age, and an ancient relic gains nothing but loses much by putting on a mask of sham newness. It is to be regretted that all the windows of the Chancery Lane front have been modernised; in this we have a picturesque loss that is irremediable. In the court within the gate some lattices and mullions yet remain. The archway is obtusely pointed, with its original mouldings in good condition; within the archway destruction has been effected during some unrecorded "restoration." It was originally vaulted, but the vaulting has been removed, though traces of it remain. The timbers used in building the gatehouse were brought from Henley-on-Thames. The great oaken gates, which are closed to the public every night, are believed to be the originals first hung in 1564. These are to be thoroughly repaired. The postern gate on the north side of the arch is of recent construction. Above the gateway are a group of armorial bearings, sculptured in stone, and painted in gilt, after the fashion of the Tudor decorators, a fashion, in this instance, perpetuated to the present hour. In addition to the repairs of the fabric, the drainage and sanitary arrangements are to be entirely remodelled wherever this may be necessary.

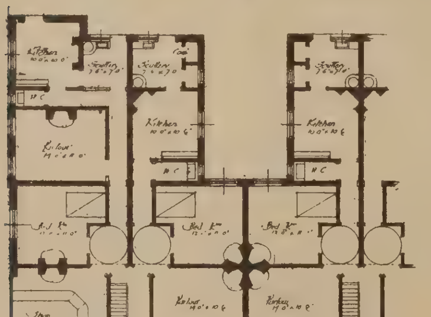
The Old Blue Coat School. THE Old Blue Coat School at the rear of the Hotel Windsor, Westminster, in what was formerly known as Palmer's Village, is now being extensively remodelled, with a view to being taken over by the existing school in Palmer's Street. The school was founded in 1688 by William Greene. Its old-fashioned windows have been replaced by others of modern design, but the statue of a Blue Coat boy over the doorway of the north front, and a painting of one of the scholars beneath the pediment on the south side, have been permitted to remain untouched. The schoolmaster's house adjoining, which was erected by public subscription in 1709, has, however, been replaced by a large and pretentious building. Our readers will remember that the school was recently sold to the local vestry on the condition that it should not be demolished until the expiration of twenty-five years.

Fire Tests with Floors. PUBLICATION No. 23 of the British Fire Prevention Committee has just made its appearance. It describes a test made on a floor by the Columbian Fire-proofing Company, of Pittsburgh, New York and London, on June 14th. The object of the test was to record the effect of a fire of two and a half hours' duration, commencing with a temperature of 500° Fahr., gradually increasing during the first thirty minutes to a temperature not exceeding 1,500° Fahr., increasing during the second and third half- hours to a temperature not exceeding 2,200° Fahr., and increasing during the fourth and fifth half-hours to a temperature not exceeding 2,500° Fahr., followed at the end of the two and a half hours by the application of a stream of water for three minutes, and the consequent rapid cooling. The area of the floor under investigation was 100ft. superficial in the clear (10ft. by 10ft.). The floor was loaded with 168lb. per foot distributed. The time allowed for construction and drying was two months and a half (Spring and Summer). The floor came out of the test practically unharmed, thus contributing most forcibly to the arguments in favour of concrete floors. The recorded effects of the test were: That the plaster on the underside of the ceiling and round the beams cracked slightly before the application of water; on the application of water some of the plaster fell off the soffit of the ceiling and beams; the concrete forming the floor was not damaged, that enclosing the beams was slightly damaged and cracked; the fire did not pass through the floor; and, the wood fillets bedded in the upper surface of the concrete were uninjured.

Professional Practice.

Bangor.—The new Presbyterian church at the corner of Prospect and Hamilton Road, was opened last week. The building is of large proportions, and the general arrangement of the plan is a departure from ordinary church architecture. A large open auditorium space, giving seating accommodation for a congregation of about 1,000, was secured for the site, and the arrangement of the plan to meet these requirements, led to a change from the ordinary rectangular form. The church itself is about 60ft. wide and about 80ft. long, the upper or pulpit end being 70ft. wide across the transepts, and rectangular in form. The remaining half of the church is polygonal in shape, thus giving a large amount of seating accommodation close around the pulpit. In order to avoid the structural necessity for columns the roof has been carried on steel girders in one span, and the galleries have been carried out on steel cantilevers, allowing of an uninterrupted view. At present the ground floor of the church has been completed, and the structural part only of the gallery put in, the flooring and seating for which can be fixed any time an extension of the accommodation of the church is required. A special feature externally of the building, when completed, will be the vestibule and tower. In order to save present outlay as much as possible, this vestibule and tower have been omitted, giving an unfinished appearance at present to the block of buildings. The church is carried out in a simple form of the perpendicular Gothic style. The material of which the building is composed externally is Scrabo stone shoddy dressings, with wrought window and other facings. The roof is covered with Bangor slates, and the apex of the roof is formed into a glazed dome, giving light through ceiling panelling to the whole of the centre of the church. Internally the woodwork has been finished in pitch pine, the large span of roof being panelled out with moulded ribs, and the pews and other woodwork are also finished in pitch pine. The pulpit will be of an elaborate character. It is executed in pitch pine and walnut. The platform floor of the pulpit is supported on an open row of columns with carved caps, and the balcony of the pulpit with Gothic arcading and small intermediate carved pillars. On either side of the pulpit there is a flight of steps and a large ornamental gas standard. At the back of the pulpit there is a high screen in pitch pine and walnut. A door in the centre of the screen opens into the minister's vestry at the rear. In front of the pulpit there are two area spaces, the first for communion table and the second for the choir, separated from each other by an open walnut railing. Above the pulpit is placed a stained glass window. The other windows are glazed with cathedral tinted lead lights. The heating is with the small pipe high-pressure system. The work has been carried out according to the plans and under the personal supervision of Mr. W. J. W. Roome, M.S.A., by the following:— Messrs. M'Laughlin and Harvey, builders; the structural steel work by Messrs. Richard Moreland and Sons, of London; the glazing of the windows by Messrs. James Campbell and Co.; the gasfitting by Messrs. James Baxter and Sons, York Lane; and the heating by Messrs. Crooks and Crozier.





HOUSES AT CLAYGATE. C. E. VARNDELL, ARCHITECT.

Claygate, Surrey.—The perspective and plan on this page illustrate part of some twenty houses about to be erected at Claygate, in Surrey, to meet the demand in the neighbourhood by working men for self-contained dwellings. They are to be built essentially as an investment, and while the outlay has been strictly limited, and the planning and fitting have been well considered, an attempt has been made to get an interesting elevation in contrast to the usual custom of repeating the design for the whole street. The walls would be built of a local red brick, the upper storey being either half-timbered or rough-casted, and roofed with green slates. The architect is Mr. Charles E. Varndell.

Paisley, N.B.—The Electric Lighting of Paisley was formally inaugurated last week. The system adopted is the high tension alternating in which current is generated at the works at a pressure of 2,000 volts, and carried to ten distributing stations placed at convenient centres throughout the area. At these stations the current is transformed to a pressure of 200 volts, at which it is distributed to the private consumer. The mains laid throughout the town are those of the Callendar concentric solid type, and extend to fifteen miles of cable. The area covered by the generating works at Blackhall is about two acres in extent, situated on the banks of the Cart, the water of which will be used for condensing purposes. Of a composite style of architecture, the station is built of the Cleghorn Terra-Cotta Company's first quality bricks, relieved by white stone dressings to windows, doors and cornices. It consists of two blocks, with an ornamental frontage to Blackhall Street. One block contains the engine room, boiler house, stores, workshops, &c., and the other the offices. Both are principally of a single storey. The engine room is 42ft. high to the ridge of the roof, and the boiler house about 44ft. The capacity of the machinery is sufficient for a demand equal to 12,000 eight-candle-power lamps. The Brighton scale of charges will be adopted. To the consumer the price will be 7d. per unit for the first hour's consumption, and 3d. per unit for every hour thereafter. The following is a list of the contractors engaged in the erection and equipment of the works:—Steam alternators, switchgear, rectifiers, rectifier switchgear—Messrs. S. Z. de Ferranti, Limited, Hollinwood, Oldham; boilers, Green's economiser, Vicar's mechanical stokers—Messrs. Babcox and Wilcox, Limited, Renfrew; pipework, crane, tank for condensing water—Messrs. Fullerton, Hodgart, and Barclay, Limited, Paisley; steel roofs, feed tanks, girder floors, crane gantry, &c.—Messrs. Hanna, Donald, and Wilson, Paisley; feed pumps—P. and W. M'Lellan, Ltd., Glasgow; stoker engine—Messrs. Bow, M'Lachlan and Co., Paisley; transformer chambers, transformers, and transformer chamber equipments—the Brush Electrical Engineering Company, Limited, London; mains—Messrs. Allison, Paisley; painter work—Mr. David Bett, Paisley; tile and mosaic work—the Staffordshire Tileries Company, Glasgow; public lamp pillars—Messrs. Walter Macfarlane and Co., Glasgow; arc lamps for public lighting—The Brockie Bell Arc Lamp Company, Limited, London.

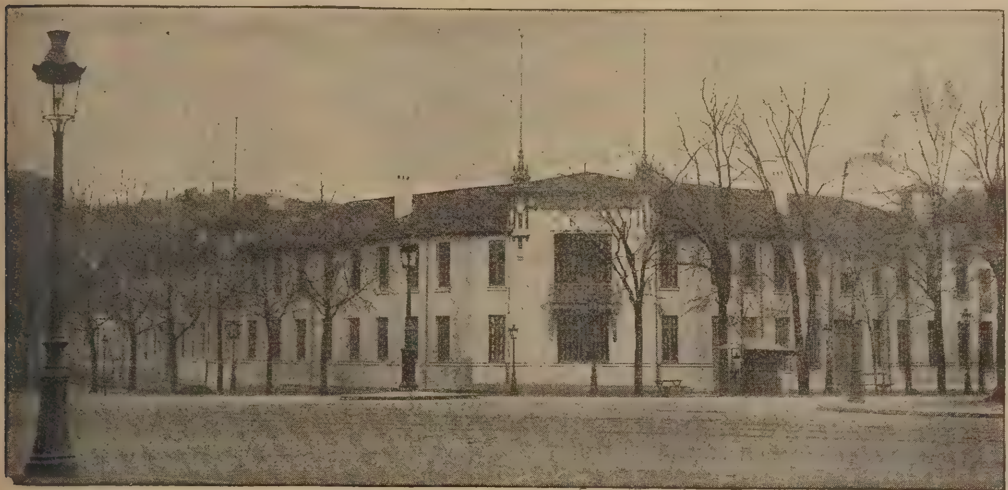
Westwood.—The new church at Westwood, in the parish of Selston, was consecrated last week by the Bishop of Derby. The church is cruciform in plan. The nave measures 61ft. by 31ft., in addition to south porch, and the chancel 31ft. by 16ft. 6in., besides the transepts, one of which will form the organ chamber and vestry. A tower and spire will be built later; for the present there is a small temporary turret to carry the bell, erected over the chancel arch. The bell weighs 1cwt. 27lb., and was cast by Messrs. John Taylor and Co., of Loughborough. Accommodation is provided for 356 worshippers. The style of building is Gothic of the perpendicular period, somewhat freely treated. The walls are of local bricks, faced with Leicestershire "sandstocks," with dressings of Matlock stone, and the roofs are covered with brown Staffordshire tiles. The internal fittings are of red deal, stained to a deep green shade, with the exception of the lectern, which is of pitch pine. This was made by Messrs. Jones and Willis, of Birmingham. The font is of red and white Hognaston stone, and was made by Mr. R. G. Lomas, of Derby. The building is warmed by hot water on the low pressure system. Mr. P. H. Cary, of Derby, was the architect, and Mr. Wm. Salt, of Ripley, the builder.

New Congregationsl Church at Blackpool.—The foundation stones of a new Congregational church were laid by Mr. Henry Fisher and Mr. Alderman T. H. Smith on Tuesday last week.

Trade and Craft.

THE "MACK" FIREPROOF SLABS.

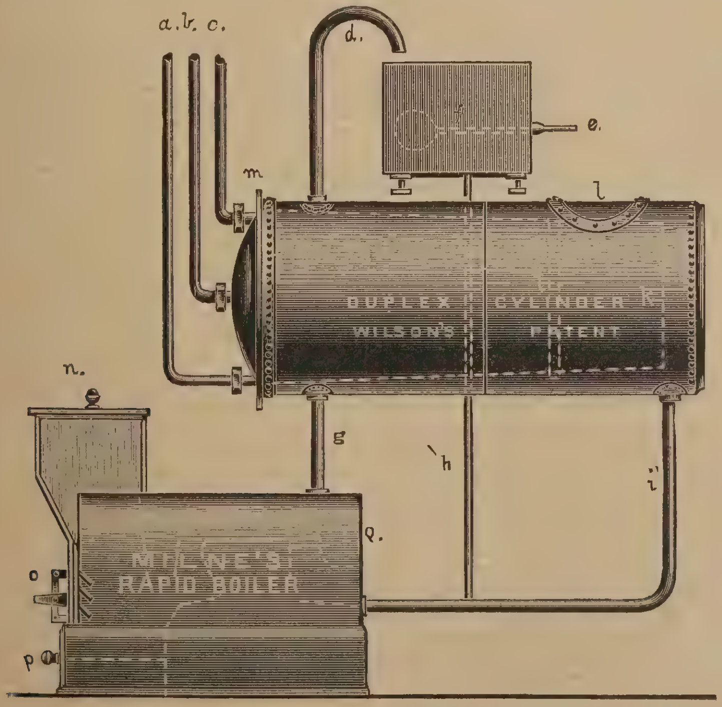
Below we give an exterior view of part of the large building that contains the administrative offices of the Paris Exhibition, 1900. It was the intention originally of the Parisian authorities to erect a wooden structure, but, in consequence of the disastrous fire at the Charity Bazaar, it was decided to make the building fireproof, and the "Mack" Patent Fireproof Plaster Slabs were used throughout for floors, partitions, and exterior walls. We understand that not only has the work given entire satisfaction, but also that it cost £1,000 less than the estimate for the wooden structure. The wall slabs are made with an asbestos backing, and are used instead of the ordinary mode of plastering walls. It is claimed that there is a great saving of time by this process of fireproofing. Another variety manufactured by the Mack Patent Fire and Sound Proof Slab Company is with tiles embedded in slabs, which can be cleanly and easily adapted to any house.



PALAIS DE L'ADMINISTRATION, PARIS EXHIBITION, 1900.

AN IMPROVED SYSTEM OF HOT WATER SUPPLY.

The apparatus illustrated herewith has been designed by Messrs. W. Wilson & Co., the well-known engineers, of 50, King Street, Manchester, and is arranged to give a most efficient supply of hot water for domestic purposes, viz., baths, lavatories, and sinks. It is also provided for heating coils and radiators. Yet the water in the two circulations does not mix. The water in the inner copper cylinder is heated by that in the outer iron cylinder, which is heated by the Milne's "Rapid" boiler. The domestic water never boils, therefore very little, if any, deposit takes place, and the water in the boiler and outer cylinder never changes, so that there is no deposit in the boiler or heating pipes. There is very little pressure on the boiler or cylinder, as the feed cistern is only a few feet above top of cylinder, consequently the heating mains can all be shut off in summer-time, and yet the boiler can be left with perfect safety, having an open-air pipe off the top of the cylinder. The boiler which Messrs. Wilson have decided to adopt in connection with their system, is the Milne's "Rapid" boiler, with patent smoke-consuming fire, designed by Mr. E. P. Milne, 15, Craven Street, London, W.C., which we described and illustrated in our issue of June 14th, 1899. The advantages resulting from this combined system are the absence of incrustation in pipes and boiler, the non-production of smoke, and the great economy in fuel from the burning of common slack coal in the smoke-consuming fire, which heats both circulations. We understand that the new laundry at the Wandsworth Technical Institute has been fitted with one of Milne's improved water-heaters, and a similar apparatus has recently been fixed in the Albion Hotel, Eastbourne.



AN IMPROVED SYSTEM OF HOT WATER SUPPLY

A Roman Pavement at Dorchester.—THE Roman tesselated floor at Dorchester has now been excavated. The design of the pavement is very elaborate, and, though considerable damage has been caused by the cutting of a drain through it before the discovery was made, a large proportion of the pavement is well preserved. The floor is considered to be that of a tablinum or other principal room, and the work was probably done late in the Roman era. The Dorchester Town Council are approaching the Dorset Museum and the Dorset Antiquarian Society with the view to joint action being taken for the acquisition of the relics, which at present belong to a private person, who is developing the land for building purposes. Dr. Colley March, the well-known antiquary, has inspected the floor on behalf of the British Museum, and it depends on his report whether a delegate from the Museum will examine the relics. A quantity of pottery and human remains have also been found.

Keystones.

A New Wesleyan Church at Ulverston is to be erected at a cost of £4,500. Fourteen memorial stones were laid recently.

New Police Buildings at Coventry were opened on Thursday. The buildings have been erected at a cost of nearly £14,000 by Mr. C. G. Hill from plans by Mr. H. Quick.

A New Higher Grade School is to be erected by the Greenock School Board at a cost of about £15,000. Mr. Bryden is the architect.

The Iron Bridge over the Traun, Gmunden, Austria, collapsed on Friday afternoon. Out of twenty persons who were endeavouring to strengthen it only one was saved.

The New Institute, Free Library, and Royal Museum at Canterbury was opened last week by the Mayor, Alderman George Collard. The bulk of the cost is covered by a bequest of £10,000 left to the City by the late Dr. Beaney, of Melbourne.

Brickworks Destroyed by Fire.—On Monday, last week, the works of the Quarry Hill Brick Company at Tonbridge, were entirely destroyed by fire. The outbreak occurred at five o'clock, and spread with such rapidity, owing to the materials of which the buildings were composed, that in an hour the whole of them, together with engines and machinery, were destroyed.

New Swimming Baths at Battersea.—Mr. John Burns, M.P., performed the ceremony of laying the foundation stone of the new public baths and washhouses which are being erected by the Battersea Vestry, near Battersea Park Station. The buildings, which are estimated to cost £35,000, will be in the English Renaissance style, and the accommodation is designed so that the large swimming-bath may be utilised as a public hall during the winter months.

A New Churchyard Cross at Farnham Royal has just been dedicated. The cross is 15ft. high, and is formed of massive blocks of Sicilian marble, each weighing several tons, and out from the central block the rising Saviour is seen leaving the tomb, coming forth with outstretched arms; the only words on the front, "Come unto Me," appear in bold raised letters on the plinth below, while high above all stands the ancient Celtic cross, very elaborately sculptured, and richly ornamented. The whole of the work has been designed and executed in the studios of Mr. E. J. Physick.

The Celtic Memorial Cross at Adare, which is at present on exhibition on the Dunraven estate, Adare, co. Limerick, is composed of carefully chosen limestone of remarkable whiteness and uniform colour from the Sheephouse Quarries, in County Louth. Elaborate carving covers the four sides of the cross, and partakes of different designs, a cable moulding which ornaments the angles being particularly fine. The base has also the angles cabled, and the front panel is remarkable for a deeply-recessed marble panel, surrounded with Celtic ornament, and bearing an inscription in imperishable lettering. The designing and superintendence of the work were entrusted to Mr. W. P. O'Neill, architect, of Lower Ormond Quay, and the contract was carried out by Mr. George Smith.

New St. Deiniol's Library at Hawarden.—The committee of the Gladstone Memorial Fund having allotted a sum of £10,000 for the erection of a permanent building at Hawarden to house the books now in the corrugated iron building erected by Mr. Gladstone, it has been arranged that the Duke of Westminster will lay the memorial stone on October 5th. The accommodation provides for the library itself a room, 30ft. by 45ft., with a gallery round, and at the north end of it a "divinity" room, 30ft. by 25ft. Leading from the latter is the warden's room, and there will be several studies beyond. The building will be Gothic in character, and faced externally with mottled Helsby stone. The architects are Messrs. Douglas and Minshull, of Chester.

A New Bank at Featherstone was opened last week for Messrs. Leatham, Tew and Company, in Station Lane.

New Sunday School at Worthing.—The memorial stones of the Sunday School in connection with the new Wesleyan church now in course of erection in Brighton Road, Worthing, were laid on Tuesday last week.

New Shambles for Arbroath. — The Arbroath Police Commission have approved of plans for the erection of new shambles in North Grimsby Street. The premises will be of an extensive description and thoroughly equipped.

The Crypt of St. George's Church, Southwark, is to be cleared of about 750 coffins by the Necropolis Company, for the churchwardens and overseers, at the following prices:—Per case of human remains, £1 13s. 8d.; per damaged or decayed coffin, £1 13s. 8d.; per coffin intact, £1 5s. 8d. Any antiquities that are found will be delivered to the parish surveyor.

Reopening of St. Andrew's Presbyterian Church, Nottingham.—St. Andrew's Presbyterian Church, Belgrave Square, Nottingham, which has been closed for the past six weeks for renovation, has just been reopened. The walls have been painted in two shades, with a Lincrusta Walton dado border, and the whole of the woodwork has been revarnished. A panelled screen has been fixed at each side of the organ and pulpit, designed to harmonise with the church fittings. The work has been carried out by Messrs. Marshall and Son and Messrs. J. H. Vickers, under the direction of Mr. J. Harris, architect.

COMING EVENTS.

Wednesday, September 20.

SANITARY INSTITUTE.—(Lectures for Sanitary Officers). —Mr. John Castell-Evans on "The Atmosphere." 8 p.m.

BUILDERS' FOREMEN AND CLERKS OF WORKS INSTITUTION.—Ordinary meeting of the members. 8 p.m.

Saturday, October 14.

ROYAL INSTITUTE OF PUBLIC HEALTH.—Last day of Health Exhibition at Blackpool.

New Companies.

Hockett and Company, Limited.

This company was registered on Aug. 31st, by Messrs. Judge and Priestly, 4, Broad Street Buildings, E.C., with a capital of £1,000 in £1 shares, to carry on the business of cartage contractors and carmen. Registered without articles of association. Registered office: 93, Tabernacle Street, Finsbury.

Messrs. Watts, Powell and Cook, Limited.

This company was registered on Sept. 5, by Mr. E. Horder, 9, Station Road, Finsbury Park, N., with a capital of £5,000 in £1 shares, to carry on the business of builders, merchants, contractors, &c. The first directors (to number not less than three nor more than six) are Messrs. M. G. Horder (chairman), W. C. Watts, A. Powell, Charles F. Cook, and Ernest N. Butler. Qualification, £100. Registered office: 110, Fenchurch Street, E.C.

Brighouse Stonecutting and General Contracting Company, Limited.

This company was registered on September 1st, by Mr. F. Hatton, 150, Strand, W.C., with a capital of £2,000 in £1 shares, to acquire and take over, as a going concern, the business carried on by Mr. Frank Crowther, at 36a, Rastrick Common, Rastrick, Yorkshire, and to carry on the business of stone merchants, stonecutters, stone carvers, monumental masons, quarrymen, and general contractors.

London and Arlesey Brick Company, Limited.

This company was registered September 1st, by Messrs. Waterlow Brothers and Layton, Limited, Birchin Lane, E.C., with a capital of £12,000 in £1 shares, to carry on at Arlesey, in the parish of Langford, in the county of Bedford, and elsewhere, the business of brick, pipe, tile, terra-cotta, and sanitary and general tube manufacturers; to adopt an agreement with Messrs. William Child and Henry Child, for the acquisition of a piece of land at Langford. The first directors (to number not less than three nor more than six) are Messrs. William Child, Henry Child, Alfred R. Blakeley, and James W. Close. Qualification, £1,000. Remuneration as fixed by the company.

Tararu Creek Gold Mining Company, Limited.

This company was registered on August 31 by Messrs. Greenip and Company, 1 and 2, George Street, E.C., with a capital of £95,000 in 10s. shares, to acquire certain mines, mining rights, &c., in the Hauraki districts of New Zealand, upon the terms of an agreement expressed to be made between a company with a similar title, in liquidation, and the liquidator thereof of the one part and A. J. Lavington, as trustee for and on behalf of this company of the other part; to seek and secure openings for the employment of capital; to acquire any other mines, mining rights, alluvial ground &c., in any part of the world, and to carry on the business of a mining and trading company in all its branches; to lay out towns and villages, &c.; as builders and contractors, &c. to erect or maintain smelting or other works &c., to negotiate loans, &c.; as mechanica engineers, &c.; to build factories, mills, &c. to deal in live and dead stock, &c.; to acquire steam and other ships, &c.; to insure with any other company or persons against losses and liabilities of all kinds; and also to carry on on its own account the businesses of marin insurance and marine accident insuranc in all their respective branches, &c. Th signatories (each one share) are Messrs H. Wilson, G. H. Stayton, G. D. Ingal D. Alten, E. H. R. Trenow, R. F. H. Webb and J. A. Travers. The first director (of whom there shall be not more tha five nor less than two) are Messrs. I Allen, C. Clark, J. H. Stayton, J. A. Traver and H. Wilson. Qualification, £500. R muneration: Chairman, £125, ordinary dire tors, £100 per annum each.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

Painting.—A. Hogarth, Coldstream	51	17	3

DARWEN (Lancs.)—For the extension of stables, Wood-street, for the Industrial Co-operative Society, Limited. Mr. J. B. Thornley, architect, 45, Market-street, Darwen. Quantities by the architect:—

T. Orrell	£2,190 0	Lloyd and Millward	£1,627 0
T. Lightbown	1,900 0	Whalley and Co.	1,568 6
Lord, Heaton, and Marsden	1,896 0	R. Shorrock, Union-street, Darwen*	1,550 0
John Knowles	1,775 6		

* Accepted.

HERTFORD.—For erecting a new factory at Hertford for Messrs. Gilbertson and Page. Mr. James Farley, architect, Hertford:—

S. Redhouse	£3,490	Guin and Son	£3,175
Merridew and Wort	3,386	Lawrence and Son, Waltham Abbey*	3,049
E. R. Kemp	3,265		
Norris and Son	3,254		

* Accepted.

DEVONPORT.—For erection of three shops and twenty-four flats for housing the working classes, for the Corporation of Devonport. Mr. J. F. Burns, Borough Surveyor, architect. Quantities by Messrs. Corderoy, Selby, and Corderoy:—

T. King	£11,375	Wakeham Bros.	£8,354
Jenkin and Son	8,990	Goad and Co.	8.297
J. Cockerell	8,960	A. R. Lethbridge and Son	7,998
F. May	8,628	S. Roberts	7,794
A. N. Coles	8,500		

LONDON, W.—For works in re-decorations at No. 45, Warrington Crescent, Maida Vale, W., for Mr. Nathanial Abrahams. Messrs. Clark and Hutchinson, architects, 28, John-street, Bedford-row, W.C.:—

A. V. Paddison	£343	F. T. Brunton and Son	£260
Hayward and Son	315		

LONDON, E.—For alterations and repairs to the "Freemasons' Arms" public-house, Salmon-lane, Limehouse, E., for Mr. Wm. Dean. Mr. J. G. Needham, architect, 18, Lower Clapton-road, N.E.:—

G. E. Todd and Co., Hackney-road	£4,965	0	0
L. H. Jackson, Poplar	4,619	0	0
Ashby and Son, Union-court, E.C.	4,484	0	0
H. Cocks and Co., Bow	4,250	0	0
J. W. Maddison, Canning Town	3,900	0	0

Gasfitting.			
Jas. Steadman, Bethnal Green	£281	10	6
Pewtering.			
R. Pringle, Brick-lane	£119	10	0
G. Rogers, Commercial-road	100	0	0
Seating, &c.			
Platt and Son, Curtain-road	68	17	6

LOWESTOFT.—For the erection of schools, Oulton. F. W. Richards, architect, Stanley-street, Lowestoft. Quantities by architect:—

Youngs	£2,285 0 0	Barham and Swan	£1,758 0 9
J. P. Smith	2,177 0 0	J. Beckett	1,664 15 0
Ashby	2,135 0 0	W. Scarle, Carlton Colville*	1,525 10 0
Atterton and Earle	1,900 0 0	Kemp & Turner	1,430 11 6
Chapman and Son	1,850 0 0		
R. C. Cole	1,784 0 0		

* Accepted.

MANCHESTER.—For the rebuilding of shop premises in King-street, Manchester, in the occupation of Messrs. Goodall, Lamb and Heighway, Ltd., for Mr. R. R. Rothwell. Messrs. Maxwell and Tuke, architects, 41, Corporation-street, Manchester:—

John Ramsbottom	£10,970	Wm. Brown and Son	£9,977
Wm. Southern and Sons	10,878	R. Neill and Son	9,510
Henry Vickers	10,200	John Bland	9,450
		W. A. Peters and Sons, Rochdale*	9,047

* Accepted.

NEWMARKET.—For erecting twenty-eight houses in Nat. Flatman-street, Newmarket. Mr. Jno. Flatman, architect:—

Kerridge and Shaw	£8,364	Linzell	£6,377
Bly Bros.	6,868	W. P. King	6,318
R. Hunt	6,812	Cowell*	5,976

* Accepted.

PENMAENMAWR (North Wales).—For the execution of sewage works, Capelulo, for the Urban District Council. Mr. Ernest Worrall, surveyor, Council Offices, Penmaenmawr. Quantities by surveyor:—

Sheffield and Thomas	£3,848	Morney and Co., Manchester*	£3,536
F. D. Chantrey	3,725	Hughes and Rowlands	3,510
Underwood Bros.	3,713	Thomas and Jones†	2,907

*Accepted. †Incomplete.

SOUTHEND-ON-SEA.—For addition of girls' school to Leigh-road Schools, for the Southend-on-Sea School Board. Mr. W. Y. Hobbis, architect. Quantities supplied:—

F. and E. Davey	£5,679	Davis and Leaney	£5,067
A. E. Symes	5,490	Dupont, Southend-on-Sea and Colchester*	4,999
Shelborne and Co.	5,420		

* Accepted.

STRATFORD.—For building three tenement houses, Aldworth-street, West Ham-lane, Stratford, for Mr. C. A. Day. Mr. J. G. Needham, architect, 18, Lower Clapton-road, N.E.:—

Taylor Bros.	£1,550	A. Webb	£1,278
J. W. Maddison	1,490	E. Jenner, Wanstead	990
Thos. Emmett	1,350		

SWINDON.—For alterations and new premises, Devizes-road, Swindon, for Messrs. Chandler Bros. Mr. W. H. Read, architect, Swindon:—

C. Williams	£1,857 10 0	Liddington	£1,720 0 0
Flewelling and Huckson	1,847 0 0	A. J. Colborne*	1,550 8 5
J. Williams	1,777 0 0	Crook	1,206 0 0

* Accepted.

WOKING.—For additions to "Robin Hood" inn, Goldsworth. Mr. W. G. Lower, architect, 12A, High-street, Guildford:—

Sims and Woods	£2,044 9 8	S. Ellis	£1,494 0 0
F. Milton	1,780 0 0	J. Gosden, Woking*	1,448 0 0
F. W. Reavell	1,600 0 0		

ELGIN, N.B.—Accepted for the erection of residence, Mayor-road, Elgin, N.B. Robert B. Pratt, architect and surveyor, County Bank House, Elgin:—

Mason.—James Young	£550	0	0
Carpenter.—A. and R. Dunbar	333	0	0
Plumber.—J. Hunter Clark	167	17	0
Slater.—James Wilson	67	10	0
Plasterer.—George Gray	94	18	0
Painter.—Wm. Fordyce	41	5	0
	£1,254	10	0

CONTRACTS OPEN.

CENTRAL LONDON SICK ASYLUM DISTRICT.

CONTRACTS FOR WINDOW BLINDS.

The Board of Management for the above district hereby invite TENDERS for the SUPPLY of WINDOW BLINDS for their new asylum at Hendon.

Printed forms of Tender, and such only, will be received containing the nature and conditions of the contract to be entered into, and the estimated amount of the articles required may be obtained from SEPTEMBER 15th to SEPTEMBER 22nd inclusive, by forwarding to the Clerk a stamped addressed envelope of foolscap size.

Sealed Tenders, addressed to the Board of Management, must be delivered not later than 10 a.m. on MONDAY, SEPTEMBER 25th, 1899, and will be opened at a meeting of the said Board at 4 p.m. on the same day.

The Board of Management do not bind themselves to accept the lowest or any Tender.

By order,
FRED W. BAILEY,
Clerk to the Managers.

Clerk's Office,
Cleveland-street Asylum,
London, W.,
September 13th, 1899.

WINN'S PATENT
"ACME"
SYPHON CISTERN.

No. 1163.

100,000 SOLD.

PRICE LIST—As drawn, 18s.; Galvanised, 26s.

CHARLES WINN & CO., Birmingham.
London Offices: 41, HOLBORN VIADUCT, E.C.

HIGH-CLASS JOINERY.

Hard-Wood Joinery and Mouldings Manufactured in First-class Style.

SATISFACTION GUARANTEED. DISTANCE NO OBJECT. FIXED & POLISHED IF REQUIRED.

Estimates Free per Return of Post.

LISSAMAN'S MOULDING & JOINERY CO.,
Mickleton, Gloucestershire.

THE
BUILDERS' MATERIAL
SUPPLY STORES,

92, BERWICK-STREET, OXFORD-STREET, W.,
12, HOPKINS-ST., BROAD-ST., GOLDEN-SQUARE, W., and
PHŒNIX WHARF, REDHILL-ST.,
REGENT'S PARK, N.W.

SUPPLY every description of MATERIALS for Bricklayers, Plasterers, Slaters, Plumbers, and Sanitary Engineers. Contractors for cartage of all kinds. Scaffolding and Miscellaneous Plant on hire or for sale. Special quotations per return of post. Enquiries and all orders, large or small, will receive immediate attention.

THE SANITARY INSTITUTE.

ANNUAL CONGRESS.

[BY OUR SPECIAL CORRESPONDENT.]

(Continued from page xliv., No. CCXL.)

ON Wednesday, August 30th, the congress resumed work, divided into eight sections. The municipal representatives met in the Town Hall, under the presidency of Mr. Alderman Thomas Walton, J.P., the chairman of the Health Committee of the Southampton Corporation, who dealt in detail with the methods adopted in Southampton to bring about an efficient system of sanitation. Two papers then followed on the

Housing of the Working Classes,

by Mr. Thomas Blashill, late architect to the L.C.C., and by Mr. C. J. Hair, A.R.I.B.A. Mr. T. Blashill declared that re-housing people from insanitary areas was the most formidable obstacle to be encountered. The cost in London was nearly £55 per head. The problem was how to avoid the enormous outlay. He expounded a new scheme, which would destroy only the slums, leave every owner the true value of his interest, and eventually rehouse or resettle every person dispossessed, without greatly encumbering the rates. His plan, in the case of a private owner of slum property, would be to compel him to rebuild his properties at his own cost, the local authority superintending the rehousing. Where there were several owners in a condemned area, the freeholders should be directed to form a trust for the improvement of their property, and be empowered to acquire leasehold interests at fair market value. No new inhabitant should be permitted to settle in such an area. The local authority would superintend resettlement, the families in the area would all be scheduled, and their position investigated. It would then be seen who were fit for rehousing on the site close by, or elsewhere. Some might have to be compensated for loss of business, but this idea was not very cordially received. Mr. Hair's paper was published in full in our last week's issue.

Dr. Charles Porter, of Stockport, read a paper on

Common Lodging-Houses.

The points to which he chiefly directed attention were :—(1) The necessity for *annual* registration ; (2) for increasing the minimum allowance of air-space per sleeper ; (3) the adequate provision of sanitary conveniences. With regard to the necessity for annual registration, he pointed out that under the existing general law, the rule is "once a registered lodging-house, always a registered lodging-house," unless the licensee has, *as such*, been three times convicted of an offence against the Public Health Act, or unless the Health Officer can obtain closure by certifying, under the Housing of the Working Classes Act, 1890, that the house is unfit for human habitation. Now, quite obviously, a house which is not unfit for human habitation may be quite unfit for a common lodging-house, and one reason why Parliament was successfully asked in Section 101 of the Stockport Corporation Bill, 1899, for power to require annual registration of these houses, is in order to be able to deal eventually with the unsuitable places at present registered.

Allowance of Air-space per Sleeper.

In former years, 250 cubic feet was regarded as a reasonable allowance, but from recent inquiry in most of the large towns it appears that 300 cubic feet is at present the usual allowance, and this is the figure suggested in the Local Government Board's memorandum of July, 1877. This standard has, however, been determined more with a view to difficulties of lodgment in large towns, and the minimum of space that can be occupied by a sleeper and his bed, than with any regard to physiological requirements, and when it is remembered that in a room of 1,000 cubic feet occupied by one man, the air must be changed three times per hour in order to keep it within the so-called "permissible limit of respiratory impurity," it will not be unreasonable to ask for a minimum allowance of 400 cubic feet per sleeper, especially by any who have visited such sleeping rooms in the small hours. This standard has been voluntarily adopted in many of the most financially successful modern lodging-houses, and in Stockport, the Sanitary Committee have decided to insist upon it. In addition, attention should of course be paid to the existence and efficiency of methods of ventilation in each case.

Sanitary Accommodation.

Section 87, of the Stockport Act of 1899, empowers the Corporation, on the report of their medical officer of health, or surveyor, to require the provision of sufficient and suitable sanitary conveniences, and as in factories and workshops with proper separate accommodation for the sexes. Having regard to the existing conditions in these respects in the average common lodging-house, there can be no question as to the importance of these provisions. In connection with common lodging-houses, Dr. Porter had found slop-water closets specially suitable.

In the Port Sanitary Authorities section, Mr. Millar Wilkinson, chairman of the Port of London Sanitary Authority, presided, and spoke on the question of sanitation in the mechantile marine. Dr. E. W. Hope, medical officer at Liverpool, spoke on the desirability of vaccination stations at seaports. Dr. H. Williams, of London, contributed a paper on the precautions which should be taken against the introduction of small-pox on passenger ships. Miss E. Bell spoke on "The Sanitation of Passenger Ships."

Dr. T. Orme Dudfield presided over the conference of Medical Officers of Health, where a discussion, introduced by Dr. Arthur Newsholm, took place, on "The Prevention of Phthisis."

In the absence of Dr. C. E. Shelley, Dr. T. W. Reid presided over the Conference of Medical Officers of Schools. —Mr. E. Purnell Hooley, County Surveyor of Nottingham, and a member of the Council of the Association of Municipal and County Engineers, presided in the municipal engineering section, held in the Art Gallery of the Hartley College. The principal feature of Mr. Hooley's address was an unsparing condemnation of the action of small councils who pass over

Professional Men

of recognised status for a "local man, the son of a builder, a broken-down farmer, or even a member of the Council," when appointing a surveyor; also of contractors who had carried out work which had been corrected, and subsequently obtained seats on the councils for the sole purpose of venting their spleen and endeavouring to upset the officials who had been the innocent cause of the trouble. The remedies he suggested were that the Local Government Board should accept the surveyor on the same footing as the medical officer of health and inspector of nuisances, and so prevent his being dismissed at the caprice of those over him without any court of appeal, and then, with superannuation in front and security of office at hand, his lot would be happier, his worries less frequent, and his mind freer to combat with his duties.—The Sanitary Inspectors' Section met under the presidency of Mr. Charles MacMahon. The subject of Mr. MacMahon's address was

"Hindrances to Sanitary Efficiency,"

among which he enumerated insecurity of tenure, which prevented inspectors carrying out their various and disagreeable duties to the highest point of efficiency, and the want of superannuation. It appeared as if the remedy for the hindrance mentioned was in sanitary officers being constituted Government officials, and responsible to a new department of State, with a Cabinet Minister at its head.—Mr. H. H. Spears, chief sanitary inspector of West Bromwich, followed with a paper, "Considerations by the way : A Plea for the Nationalisation of Health." He suggested that the administration of the Public Health Act should be taken out of the hands of the local authorities altogether, and be vested in the State. A Ministry of Public Health would be the natural outcome of any naturalisation scheme. The various provisions of the Public Health Act would be executed without fear or favour by qualified men giving their whole time and attention to their duties. They would have jurisdiction over districts whose areas would not necessarily be coterminous with those of a local authority, they would be unfettered and independent, and removed from the sinister influences incident to local control, and have powers to take immediate steps for the abatement of deleterious conditions.

In the Ladies' Section,

presided over by Mrs. Constance Patey, Mrs. H. Percy Boulnois read a paper on the hygienic aspects of occupations suitable for women, Miss Rosetta E. Gardiner read a paper on the work of a health visitor, Lady Harberton on the hygiene of dress, Miss Isabel G. Smith on the infant mortality, and Miss B. Hall on the practical teaching of hygiene in schools. The Hon. Mrs. A. T. Littleton and Mrs. Richard Andrews also dealt with the necessity for a universal teaching and practice of hygiene.

About 100 delegates drove to Southampton Waterworks at Otterbourne in the afternoon, and the same number went to the Portswood sewage farm. The isolation hospital, now in course of completion, was also visited, and in the evening the Mayor gave a conversazione on the Royal Pier.

On Thursday meetings were held in three sections, for (1) sanitary science and preventive medicine, (2) engineering and architecture, and (3) physics, chemistry, and biology. There was also a section for ladies, and the conference of sanitary inspectors was continued. Alderman Sir Joseph Ewart presided over Section 1, and his opening address was followed by a paper on "The Recrudescence of Plague in the East and its Relation to Europe," by Professor W. J. Simpson. Mr. James Lemon, F.R.I.B.A., past president of the Association of Municipal and County Engineers, presided over Section 2, devoted to architecture and engineering. He said, in opening his address, that as engineering and architecture covered such a large field, he could not in a brief address do full justice to these subjects ; he could only refer to those branches of thought and practice which more particularly refer to the maintenance of the public health.

Pure Water.

The supply of pure water to our towns and villages claimed the first attention of sanitarians, as it was a necessity of life, and without it various diseases were generated. The question as to a constant versus an intermittent supply, had been fought and won, and although in some towns and districts the water supply was intermittent, the almost universal opinion was in favour of the constant system. There was no difficulty in this country in obtaining a sufficient supply of water, but the raising of the standard of purity and increase of population had led to a scramble for a better source. How far this race from one part of the kingdom to the other, on the part of the wealthy corporations, should be permitted, was a matter for serious consideration by Parliament. It might be desirous to allocate the areas of supply to certain districts, so that it might not become a question of "first come first served," and the longest purse. The charges for baths and extra water closets were taxes upon the public health, and should be prevented by Act of Parliament. If the statutory rate was not sufficient to include these charges, the rate should be increased accordingly. As to the sources of water supply, he believed we should see great changes in the near future; Maidstone had taught us a useful lesson, and rivers were no longer considered safe and reliable. They must either be largely supplemented, or a fresh supply obtained from a new and independent source.

Sewerage.

The chief points to be observed in the designing of town sewerage schemes were a constant flow, so as to ensure self-cleansing, water-tight sewers, and adequate means for inspection. The improvement in our water supply, and the more general supply of baths had materially assisted the first point, and we now seldom saw a modern pipe sewer designed by a competent engineer without the proper velocity. There was also a marked improvement in the last few years in sewer construction, more attention being now given to the jointing. Iron pipes, and patent joints to stoneware pipes were more generally used in water-logged and damp soils. The iron pipe had a great advantage over stoneware, as it was made in 9ft. and 12ft. lengths, consequently there were fewer joints. It could also be jointed to stand pressure, and with a head of water upon it was, in his judgment, the only reliable material. These remarks as to sewers also applied to house drains; if we wanted a thoroughly water-tight drain, we should use iron pipes; the cost was not much more per house, and the result as regards efficiency could not be too highly estimated. The testing of sewers and drains, and the enforcement of regulations as to water-tight joints, had led up to better gradients and smaller sewers. Local authorities did not now look upon a pump with fear and abhorrence, as they knew within reasonable limits what the annual cost would be. They also knew that the pollution of rivers and streams would not be tolerated, and that some form of sewage disposal must be adopted. In order to do this effectually and economically, the flow at the outfall must be reduced as much as practicable. These were all steps in the progress of sanitary science; one step led to another, and as we travelled upward, the death rate went down in corresponding ratio.

Sewage Disposal.

The sewage question, like the poor, was always with us. It had been solved by every sanguine inventor who had taken out a patent during the last thirty years; but it was not solved yet. However, the merits of each particular mode of treatment had become recognised, and experts were, in most cases, willing to admit there was a place for all, and that the particular mode of disposal must be governed by local circumstances. There had been a great waste of money by local authorities and public companies in the treatment of sewage. Sewage was a thing to be got rid of at the least cost without nuisance. Large quantities of crude sewage had been poured on to heavy clay lands, and the effluent from tanks, after chemical precipitation, had been discharged into small streams. Failure had resulted, and reconstruction had become necessary. Bacterial filter-beds had now come to the front, and valuable information had been afforded. The principles laid down by the Local Government Board were sound—viz.: Rainfall and sewage to be calculated at three times the dry weather flow; above three times and up to six times to be treated on storm-water filters; above six times the storm water may be discharged into a stream or on to prepared land; the capacity of the filters to be taken at one-third for the fluid and two-thirds for the filtering material; a cycle of eight hours for filling, emptying, and rest for æration. But when they asked that the filtered effluent, after double filtration through coarse and fine filters, should be pumped on to land suitable or unsuitable, then he parted company with them. This policy of the Local Government Board was stopping the use of these bacterial filters, as they refused to grant a loan for their construction unless this land irrigation were adopted.

Pure Air.—We examined our water supply, and we knew by analysis, and by bacteriological observations, whether it was fit for consumption or not, but he was afraid we knew very little of the air which we breathed. Sanitary engineers were agreed that the drainage of w.c.'s, sinks, lavatories, and baths should be disconnected from the house, and ventilated; but there was a difference of opinion as to the merits of the "drain interceptor." If it were abolished every house-drain would ventilate the sewer. The ventilation of sewers was one of those questions upon which a great deal had been said and written, but not much progress made. In most towns there was some kind of ventilation. It was, in his judgment, desirable that the air in sewers should be in connection with the external air by openings in all desirable points. The air in the sewer was displaced by the increase in volume of the sewage, and if openings were not made for its exit, it would find its way out at places where least desired. There was a great deal to be said in favour of open gratings in the centre of the streets, but they were liable to be closed by the near householder or the local authority, and therefore were not reliable. He had come to the conclusion that properly designed shafts should be provided, so that the air in the sewer might be changed as frequently as possible; some of these shafts would be inlets and some outlets, but in any case a diffusion of the sewer air would take place. There was not, however, that necessity for sewer ventilation now, which there was in the earlier days of sewer construction, sewers were now better designed, had better gradients, were laid more accurately, and were better flushed; consequently there was less deposit of fæcal matter, less decomposition, and less generation of noxious gases.

Healthy Dwellings.

One of the first considerations was the adoption of a dry sub-soil. In crowded towns this could not always be obtained; vacant spaces were swallowed up by the "jerry builder," and as many houses as possible crowded upon a given area; but the local authority could make by-laws to minimise the evil. They could stipulate that the entire area of the house should be covered with concrete. That the sub-soil be drained, and that the space under the floor be ventilated. In most by-laws the local authority had adopted 150ft. super as the air space. It could be increased with advantage to the public health. The height of rooms was fixed at 8ft. as a minimum, but there should be some regulation as to the minimum area. If the cubic capacity given in the model by-laws, viz., 400ft. per adult, were adopted, then a room could not be less than 100ft. area for two persons. This was too small, as it only gave a room 10ft. by 10ft. Under Section 91 of the Public Health Act, "Any house or part of a house so overcrowded as to be dangerous or injurious to the health of the inmates, whether or not members of the same family," was held to be a nuisance. But this section was practically a dead letter. The medical officer made a representation to the local authority; he condemned a certain area, and stated that an improvement scheme was necessary. The local authority considered the representation, and sometimes made up its mind to do something. Plans and estimates were prepared and adopted, and the Local Government Board sat upon them; a local inquiry was then held, and in due course a provisional order was issued. After a time the valuers of these dilapidated houses commenced their work. Differences, of course, arose. Then the inevitable arbitration commenced. In the end the local authority realised that the costs, legal and otherwise, were a considerable item, and that it was cheaper to settle than to fight, even though the case was won.

The architect was thus handicapped at the start, as he could not design workmen's dwellings which would repay the capital and pay the interest and working expenses plus this abnormally heavy ground rent. Then what was the remedy? This question was most ably dealt with in a paper read by Mr. Percy Boulnois in the year 1893, in reference to the improvement scheme of the Corporation of Liverpool, where there was an annual loss of £4,512. The Corporation considered this annual charge for clearing the site, too much to be thrown upon the buildings, they accordingly fixed what they considered a fair ground rent, and charged the difference to the rates. This was a way out of the difficulty; but it was only a transfer of account after all, and the fact remained that the difference between income and expenditure must be borne by the ratepayers. Some other remedy must be found to reduce the overcrowding in large towns.

The evils of overcrowding were admitted by all who have studied the question; it was the chief social problem of the age, but he did not think it would be solved by erecting large blocks of buildings in the centres of industry, and crowding the poor together on the same area, only under better conditions. These blocks in twenty years' time might become slums by overcrowding, unless the present high standard of maintenance and supervision was continued. One of the remedies he suggested for overcrowding was the erection of workmen's dwellings in the suburbs of our large towns, where the land can be obtained at a cheap rate. The architect, under such conditions, would have fair play, and he would be able to design healthy dwellings, which would let at a rent sufficient to cover the expenditure, including interest and the payment of the sinking fund. The only condition necessary to render this scheme a success, was a tramway or light railway between the portion of the town where the workman earned his living, and the suburbs where the houses referred to were built. It would pay a local authority in a large town to carry workmen to and fro on a tramway worked by electric traction, at one penny per journey the whole distance. The middle class, and even the clerk, sought a home where there was "more room to live"; and the crowds who flocked into London in the morning by the suburban railways testified to the advantages of the system. Then why should the workman not do the same? The only reasons he knew were: (1) Proper provision was not made by railway companies and local authorities to carry him at a low charge; (2) Many preferred or were compelled, to live near their work. Railway companies were forced by Parliament to provide for the workmen they displaced when they sought powers to widen their lines or increase the areas of their stations; but why should they not be allowed to set apart land for the labouring classes in the suburbs, or build houses and include the railway fare in the rent, such rent not to exceed that paid in the houses they pull down? The housing of the poor was at the bottom of many labour troubles. When a workman paid one-fourth to one-third of his earnings in rent and rates, could we wonder at his action when he agitated for better pay? The price of labour was continually going up, and the cost of building houses followed, rents were increased, and everyone suffered some indirect loss. He hoped Parliament and local authorities would take united action to eradicate this moral cancer which was paralysing our industries. What we wanted in our large towns was expansion, and not concentration, in the interest of the public health, in the interest of temperance, and in the raising of the standard of morality and well-being of the people.

Professor Henry Robinson read a paper on the

Storage of Flood Water,

and said the better conservation of the rainfall was a national question, as the population increased but the water available for their requirements did not increase, and every year there arose a struggle for watersheds from which to obtain the supply for large towns, while the populations in villages too often depended upon shallow wells, which were liable to pollution. There was a grave need of well-considered and comprehensive treatment of watersheds, so that flood waters should be stored, thus rendering the flow of rivers more equable, and the excess water, which now did mischief by causing floods, would be available for domestic supply, irrigation, improving navigation in rivers and canals, &c. The initial difficulty, however, was the cost.

"The developments in hospital planning and construction, resulting from the employment of plenum ventilation," was the subject treated by Mr. William Henman. The plenum system, he pointed out, was the propulsion of air for hospital purposes, and when this means of ventilation was employed the air could be cleansed, tempered, and brought to a suitable hygrometric condition without the necessity for having apparatus of any kind in the habitable parts of the buildings. Unpleasant draughts were avoided, and the effectiveness of appliances for changing the air was fully utilised. Several years of experience had demonstrated that with an efficient means of securing

Ventilation on the Plenum System,

window-opening could, with actual advantage, be dispensed with. Further developments of the system were now being tried, which would provide for a supply of cleansed and tempered air, equal to a change of air ten times per hour night and day throughout the buildings. On looking back to the opposition from many sources which faced him six years ago when it became known that the General Hospital at Birmingham was to be ventilated on the plenum system, and calling to mind the many "high authorities" who, having predicted failure, were now all ready to recognise it as an acknowledged success, he could not suppose that the bolder step would meet with unqualified approval, and although he would not presume to say that absolute perfection would be obtained, he felt thoroughly justified in making the attempt.

(To be concluded.)

Surveying and Sanitary Notes.

Street Improvements at Cleethorpes.—The Local Government Board has written to the District Council sanctioning the borrowing of £3,820 for widening Grimsby Road from Isaacs Hill to Lovett Street, making the road 56ft. wide.

Street Improvements at Sheffield.—At the Town Hall, Sheffield, recently, Mr. C. Perrin, M.Inst. C.E., Local Government Board Inspector, held an inquiry with reference to the application made by the City Council to borrow £38,323, for the purposes of street improvements.

A Street Improvement Case.—At the Grimsby County Police Court last week the magistrates gave judgment in the two objections taken by Mr. Henry Kelly, of Cleethorpes, against his liability to contribute towards the cost of the making of certain private street improvements. Two objections were in effect taken against Mr. Kelly's liability under the Private Streets Works Act, 1892, to contribute towards the cost of the proposed works in Oole Road—(1) that Oole Road is not a street within the meaning of the Act; (2) that he has no right of way over or to make way into Oole Road, and consequently will derive no benefit from the proposed works. In giving judgment the chairman stated that the question for them to determine was not whether the by-laws had been complied with (that was a question to be raised in some other court), but whether the place was a street within the meaning of the Act. It could not be denied that Mr. Kelly's premises were premises "fronting, adjoining, or abutting upon" such street in point of fact. They were immediately contiguous to the road for a considerable part of its length, and only divided from it by a hedge and ditch, which were Mr. Kelly's, and were part of his premises. They thought Mr. Kelly had a right of access to it from his premises through his own hedge and over his ditch. But even if it was a purely private street, want of right of access alone could not prevent premises adjoining it in fact from being premises adjoining it in law also. There was no express authority to that effect, but in their opinion this was the correct interpretation of the statute, but they were clearly of opinion that Mr. Kelly was liable to contribute towards the cost of the proposed works. The next question was whether Mr. Kelly should pay in proportion to his frontage in Oole Road, or whether any abatement should be made by reason of his having at present, as alleged, no right of access to the road, and no building upon the land. Upon that point the Bench said all they could take into consideration was whether the apportioned amount was arithmetically correct according to the measurement of the frontage. In their view they had only jurisdiction to interfere where the local authority had gone out of their way to adopt a different principal of apportionment to the normal and standard principal of apportionment according to frontage. They, therefore, dismissed all Mr. Kelly's objections with costs, but as the chief question had not been decided in any Supreme Court they were quite willing to grant a case if desired.

Masters and Men.

The Dundee Plasterers' Labourers' Strike still remains unsettled.

Newcastle, Gateshead, and District Plasterers have received an advance of wages of 2s. 1d. a week.

Tyne-side and Tees-side Joiners propose to ask the masters for an advance of 2s. per week because the trade is in a good condition.

Mid-Lancashire Engineers' Dispute.—Lord James of Hereford sat at Salisbury on Tuesday, last week, to determine the question of fact whether there existed an agreement between the masters and men in the Mid-Lancashire engineering trade that, if the trade at the end of June continued as good as in March an advance of 1s. a week should be conceded. After hearing evidence and a statement by the accountant who had examined the books in Mid-Lancashire, Lord James intimated that he would give his decision in a week or ten days.

Manchester Plasterers' Dispute.—It will be remembered that at a joint conference between the Manchester Plasterers' Association and the representatives of the plasterers' labourers it was agreed that the men should return to work on Tuesday last week, on the employers undertaking to concede an advance of a farthing per hour and another farthing in six months' time. Much to the employers' surprise the men did not return to work as agreed. They refuse to abide by the agreement until non-Union men have actually been sent out of the town.

Slaters doing Masons' Work.—A mass meeting of slaters in Dundee and district was held last week for the purpose of discussing the charge made by the Trades Council of slaters performing the work of masons and others connected with the building trade. The members, it is understood, did not seek to deny the charge, but held that the system of overlapping was one which prevailed in all trades, while it was also stated that mason work was often contracted out to slaters. These points were the basis of their defence, and a deputation of seven was appointed to appear before the Trades Council and state the case.

Dispute in the Rotherham Stove Grate Trade.—The workmen, to the number of 150, of Messrs. Wright and Co., Stove Grate manufacturers, of Burton Weir Works, Rotherham, went out on strike last week. A difficulty arose with regard to the employment of two youths in one of the departments, and in order to effect their removal, notices to terminate engagements were handed in by the men. These notices expired at the end of last week. The grievance relating to the youths has been settled, but a new difficulty has arisen as to a proposal to alter certain of the conditions of work. It is not expected any serious delay will arise in coming to terms. The workmen are members of the National Union of Stove Grate Workers.

Claim by a Night Watchman's Widow.—In the Glasgow Sheriff's Court, Sheriff Strachan gave his decision in an action brought under the Workmen's Compensation Act, by Mrs. Mary Simpson, widow of John Simpson, night watchman, residing at 5, Bishop Street, Port Dundas, against Messrs. James Graham and Company, wrights and timber merchants, 184, George Street, Glasgow. Plaintiff claimed £163 16s. as compensation for the death of her husband, John Simpson, who, while in the defendants' employment, was killed by slipping off a plank, used as a gangway, at a building being demolished to the east of 144, George Street. Deceased fell 14ft. and broke his neck, his fall, it is averred, being the result of a temporary faintness, which caused him to stumble. There were two other dependents besides the widow, both imbecile daughters of the deceased. His Lordship found that the deceased died from injuries sustained by him while in the employment of the defendants, and awarded £100 to the applicant and £41 to Jessie Simpson, one of the daughters; the other daughter having been for some time in an asylum supported by the local authorities was, therefore, not dependent on the deceased. The defendants pleaded that the death of the deceased did not arise out of or in the course of his employment, as he was crossing the plank to go to the back part of the premises to have his tea. His Lordship said that deceased required to take his tea in the building, as he was prohibited from leaving it, and his doing so was necessarily connected with his employment.

Workmen's Compensation Act Criticised.—Sheriff Fyfe, of Glasgow, issued his decision recently in a case under the Workmen's Compensation Act. The plaintiff was John Jackson, an engine fitter, residing in Crown Street, Glasgow, and the defendants were Messrs. A. Rogers and Co., shipbuilders, Port Glasgow. The sheriff found the defendants liable in compensation to the plaintiff. It seems that the defendants contracted with a Leith firm to build and deliver to it a vessel and engines complete. They subsequently contracted with Messrs. Hall, Brown, Buttery and Co., engineers, of Glasgow, to build the engines and fit them on board the vessel. Plaintiff was employed by this firm, and whilst working on board the vessel on November 8th, 1898, a piece of timber fell upon his head, in consequence of which he lost the sight of his right eye and his other eye was impaired, and he was incapacitated from following his occupation. His average weekly wage previous to the accident was 36s. In a note, the sheriff said that the case very forcibly illustrated the possibilities of protracted and expensive litigation under the Workmen's Compensation Act, the chief glory of which piece of legislation was meant to be the prevention of all litigation. Plaintiff was employed by the engineer sub-contractors and paid by them, and he was engaged at work upon the vessel only at Glasgow, and only in the engineer's department. Nevertheless, under the provisions of this extraordinary piece of legislation, he felt shut up to the conclusion that it was the ship-builders and not the engineers who must compensate this workman. It had been decided that the place where this accident happened was a "factory," and that the defenders were the occupiers of the "factory." On that account the occupiers of this ship-building yard factory, floating in the Glasgow Dock, in virtue of their being occupiers, were the "undertakers" in the sense of the Act, and it was the undertakers who were liable in compensation. All he had to decide, therefore, was the amount of compensation, which he had fixed at 18s. (commencing on November 22, 1898) a week. This was subject to future reconsideration of the Court if the circumstances changed.

The District Hospital, Aberdeen, is being warmed and ventilated by means of Shorland's patent Manchester stoves with descending smoke flues, supplied by Messrs. E. H. Shorland and Brother, of Manchester.

HULL BUILDING TRADE DISPUTE.

At a meeting of the operatives on Tuesday, last week, in the Assembly Rooms, Jarratt Street, Hull, to consider the proposals submitted by the Hull Master Builders' Association at the recently held conference, speeches reviewing the progress of the dispute were made by the chairman (Mr. W. Lawson) and Messrs. Gold, Green, Flannaghan, and Cuttill, after which the audience, which consisted of members of the bricklayers', plasterers', joiners', and builders' labourers' Unions, were invited to vote for or against the acceptance of the masters' proposals, which are as follow :—

1. That all men who left their work at the time the dispute commenced shall return to their respective shops on the old rules (excepting those rules affected by the proposed alteration in boundary and starting places and winter working hours), and it shall be left to the employers' discretion as to what men shall be paid off (if any) after such return.
2. That we intend to act honourably to our non-Union and imported men, and carry out our agreements with them.
3. The Federated masters when requiring men now or in the future shall apply first to the operatives' society for them ; if they fail to supply the number of competent men required, the employers shall have the right to employ all comers, whether they be Union or non-Union men, and that all shall work peaceably together.
4. The masters admit the right of the men to use reasonable persuasion to induce non-Union men to join the Union, and it is further understood that no delegates be allowed to come on any jobs or shops.
5. Foremen shall not be compelled to join the operatives' society, nor compelled by the masters to leave one.
6. That a provisional Board of Conciliation be established, pending the national agreement coming into operation, to deal with any matters that may arise—the Board to consist of one representative from each trade. The President of the Hull Master Builders' Association for the time being shall preside.

When the voting papers were counted it was found that the proposals had been rejected by 1,208 votes to seven. The meeting then proceeded to the consideration of the counter suggestions which the joint committee of their societies had drafted as a basis of settlement, and which are as follow :—

1. That all men who left their work at the time the dispute commenced may return to their respective shops on the old rules, providing there are no imported or objectionable men employed thereat, and the joiners to receive one halfpenny per hour advance on the old rate of wages.
2. That we have no objections to those employers who have non-Union and imported men carrying out their agreements with them.
3. The federated employers when requiring men now, or in the future, shall apply to the operatives' societies for them ; if they fail to supply within a reasonable time the number of men required, the employers shall have a right to employ all comers whether they be Union or non Union men.
4. The workmen claim the right to use reasonable persuasion to induce non-Union men to join the Union, and in case any dispute arise in any shop or on any job, no man to leave his employment until the district delegate has made inquiries and investigated.
5. Managing foremen (that is to say, those who do not work with the tools) shall not be compelled to join the operatives' societies, nor compelled by the employers to leave one.
6. That, in order to meet any difficulties that may arise, we are favourable to the formation of a Conciliation Board to deal promptly with any differences in the future. The number and composition of the board to be mutually arranged.

All the paragraphs with the exception of the first and sixth were rejected on a show of hands. The two excepted paragraphs were made into a resolution, which was moved and seconded and carried unanimously.

A conference between the master builders and workmen was held on Wednesday night for the consideration of the dispute. The operatives' delegates announced the result of the meeting of the men on the previous day, and handed in a copy of the resolution then arrived at, which resolution the masters considered it impossible to accept, saying that to do so would be to renew the trouble, as it provided that Unionists should not work in any shop where "objectionable" men were employed, nor on any job where non-Union men were at work. It was pointed out that many public works were in the hands of master bricklayers and joiners, and it might be that the bricklayers had at work Union men, whilst the joiners had non-Union men, and that complications might thus arise. There being no prospect of agreement the conference was adjourned *sine die*.

Engineering Notes.

Stonehenge Railway Station is to be extended at a cost of between £5,000 and £6,000.

The Darlington Electric Tramway Scheme has been sanctioned by the Light Railway Commissioners.

Victoria Station, Manchester, is being extended by the Lancashire and Yorkshire Railway Company. There will be a great increase in platform accommodation. One principal feature of the extensions is the building of a new and longer bridge over Cheetham Hill Road, more on the Miles Platting side. When this work has been accomplished, and the old road diverted, the existing structure will be pulled down. The Irk will be covered—to the great advantage of the community—between Hunt's Bank and the crossing over the river near Red Bank. Near Corporation Street there will be several new platforms for the accommodation of traffic from the Yorkshire district.

An Iron and Steel Company for Sydney, Cape Breton, Canada.—A syndicate composed of Mr. H. M. Whitney, of Boston, Sir William Van Horne, of Montreal, Senator Cox, of Toronto, and others, has been incorporated as the Dominion Iron and Steel Company. This immense concern expects to be in working order eighteen months from this date, and consists of large iron ore deposits in Cape Breton and Newfoundland. The contracts for the coke ovens have already been given to the United Gas and Coke Company, of Everett; and the blast furnaces, steel converters, and steel mills to the Riter Conly Company, of Pittsburg, which has already over 500 men at work. The output is calculated at 1,000 tons per day in pig iron, steel slabs, and billets, which will make the Montreal Mills independent of the United States for this raw material. The people of Sydney look forward to their town being the Pittsburg of Canada, and they are expecting great things in the future. The Merchants' Bank of Halifax and the Bank of Montreal are on the lookout for sites for branch banks, and a general boom in building is expected.

The Cockett Tunnel.—A report has been issued by Lieutenant-Colonel H. A. Yorke, R.E., Assistant Secretary to the Railway Department of the Board of Trade, giving the result of his inquiry into the partial failure of the roof of Cockett Tunnel, on the Great Western Railway, that occurred on June 19th. The report states that the disaster is to be attributed to the coal workings which have existed for a number of years below the tunnel. These workings belong to the Weigfawr pit, and from 1856 to 1892 were flooded and abandoned. The movement of the tunnel was to be traced to the removal of the water from the workings. Since the accident the fallen arch has been restored by means of eight rings of brickwork laid in cement, and, as it was not considered advisable to fill up the cavity caused by the fall, owing to the danger to which the men so employed would have been exposed, a close timbering of 14in. balks resting at each end on the new arches was inserted, on the top of which brushwood fascines were tightly packed 5ft. deep. The work was completed on July 15th, and goods traffic is now being conducted through the tunnel; but, for the convenience of the engineering department, and in order to expedite the work, it is not proposed to permit passenger trains to pass through until the fixing of the steel ribs at the east end of the tunnel is further advanced. Passenger trains are, therefore, still being diverted *via* Gowerton and Swansea (London and North-Western Railway). The tunnel may at present be regarded as safe, and may, in the opinion of the engineers, be expected to remain so, so long as the conditions as to coal workings remain as they are now. It will, however, require to be carefully watched, and should any fresh signs of scaling or crushing of bricks in the roof show themselves the tunnel should be immediately closed to all traffic.

The Coast Development Company, Limited, have decided to build a new pier at Southwold, in extension of their work of developing the coast, which has already been helped greatly by their piers at Clacton, 1,300ft. in length, and Walton. The contract for the new pier is with Messrs. A. Fasey and Son, of London. The engineer is Mr. Jaffrey, of Victoria Street, W. The length of the pier is to be 700ft., and its construction is to be sufficiently advanced by next year that the steamers will be able to call on their way to Yarmouth. The work, so far, is to cost £7,000, after which a pierhead is to be formed with a concert pavilion on it. It is also intended to erect at Southwold a new hotel, to be called "The Grand," the foundations for which have already been commenced. Mr. C. H. M. Mileham is the architect, and the plans were exhibited at this year's Royal Academy. Walton Pier, which has now an electric railway half a mile in length, will shortly have a pavilion capable of holding 750 persons. The Pier Hotel, which is owned by the Company, has recently been enlarged, redecorated, and handsomely furnished, and a scheme is being prepared to enlarge it. The Company are also erecting on the Round Garden, opposite the railway station, a floral hall and winter gardens, with refreshment rooms, &c., attached, which will be completed by next season. The popular "Belle Steamers," belonging to the Company, close their season on September 25th, which has been so successful that another steamer is now in course of construction by Messrs. Wm. Denny and Bros., of Dumbarton.

Builders' Notes.

A Building Accident occurred at **Arbroath** last week whereby two men were seriously injured. Building improvements are being carried out on the property at the corner of High Street and James Street, and the building had reached the height of the finishing of the second storey. At the corner a series of ornamental projecting stones are being built in, and the two masons, whose names are Peter Carlin and Charles Russell, were engaged placing a stone in the third tier of these when the whole set of stones overbalanced and fell to the ground, 30ft. below, carrying the men with them. Both were seriously hurt, and had to be conveyed to the infirmary.

The L.C.C. Defrauded.—In the County of London Sessions, before Mr. McConnell, Chairman, sitting at Clerkenwell on the 7th inst. James Hutchings and Benjamin Goulding pleaded "Guilty" to an indictment for conspiracy to defraud the London County Council, and for obtaining from them various sums of money amounting in all to £10. Mr. Biron, for the prosecution, said the prisoners had been employed on some building work which was being done by the County Council in the East-end, Hutchings being a timekeeper and Goulding a bricklayer. It was the custom that if any labourer was absent through illness or other good reason he was allowed to authorise a fellow-workman, in writing to draw his wages for him. The prisoners had been obtaining money by means of forged authorities of this kind. Goulding would present a letter purporting to come from some fellow-workman, who really did not exist, authorising him to draw his wages for him. Hutchins would countersign the letter as if the money was in fact due, and so they would obtain payment from the cashier and divide the proceeds between them. They had been defrauding their employers in this way for a month before they were discovered. Hutchins was sentenced to be imprisoned for nine months and Goulding for six months' as prisoners of the second division.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
	BUILDINGS—		
Sept. 22	Winchester—Alterations, &c., to Laundry Block	Workhouse Guardians	Cancellor and Hill, Architects, Winchester.
,, 23	Dunmow, Essex—Horse-boxes, Cart Sheds, &c.	....	Wade, Wix, and Wade, Dunmow.
,, 23	Egremont, Cheshire—Underground Convenience	Wallasey Urban District Council	W. H. Travers, District Surveyor, Public Offices, Egremont.
,, 23	Tudhoe, Durham—Repointing School Front	School Board	S. Adams, 56, North Bondgate, Bishop Auckland.
,, 23	Wickeridge, near Ashburton—Wing to House	....	— Barrons, Weir View, Totnes.
,, 23	Pontypridd—Workhouse and Boundary Walls	Guardians	E. C. Spickett, Clerk, Workhouse, Pontypridd.
,, 25	Clones, Ireland—Schools	....	T. Elliott, 37, Darling-street, Enniskillen.
,, 25	Cerne Abbas, Dorset—Building Works at Workhouse	Union Guardians	A. E. A. Cole, Union Offices, Cerne Abbas, Dorset.
,, 25	Ballyshannon, Ireland—Repairs, &c., to Church	....	T. Elliott, 37, Darling-street, Enniskillen.
,, 25	Consett, Durham—Four Houses	....	R. Robson, Front-street, Leadgate.
,, 25	Halifax—Workshops	....	F. Fielden, 7, Fountain-street, Halifax.
,, 25	Leek, Staffs.—Galvanised Iron Shed	Urban District Council	J. Myatt, Town Surveyor, Town Hall, Leek, Staffs.
,, 25	Scarborough—Detached House	....	J. C. Petch, Architect, Bank-chambers, Scarborough.
,, 26	Cork—Offices, &c.	Lunham Bros., Limited	R. Walker and Son, 17, South-mall, Cork.
,, 26	Edmonton—Supply of Portland Cement	Urban District Council	G. E. Eachus, Engineer, Town Hall, Edmonton.
,, 26	South Shields—School	School Board	F. Rennoldson, 37, King-street, South Shields.
,, 26	Walthamstow—Out Office at Schools	School Board	W. A. Longmore, Bridge-chambers, Hoe-st., Walthamstow.
,, 27	London, W.—Alterations at Woodfield House	Paddington Guardians	F. J. Smith, Parliament-mansions, Victoria-street, S.W.
,, 27	London, S.E.—Tooled Yorkshire Stone	Greenwich Board of Works	J. Spencer, 141, Greenwich-road, Greenwich.
,, 28	Chopwell, Durham—Three Houses	R. Armstrong	Badenoch and Bruce, 55, Pilgrim-street, Newcastle-on-Tyne.
,, 28	Longtown—Villa Residence	....	G. Armstrong, 24, Bank-street, Carlisle.
,, 28	Staines—Infants' School	School Board	Murray and Dibdin, 5, Hurstbourne-road, Forest Hill, S.E.
,, 28	Salford—Tiling Floors, &c., in Town Hall	Town Hall's Committee	Borough Engineer, Town Hall, Salford.
,, 29	Hereford—Renovating Cottage	Standing Joint Committee	A. Dryland, County Surveyor, Hereford.
,, 29	Margate—Coastguard Buildings	Admiralty	Director of Works Department, 21, Northumberland-av., W.C.
,, 30	Hallwill, Devon—Cottage Hospital	....	C. F. A. Voysey, 6, Carlton Hill, N.W.
,, 30	Arundel, Sussex—Billiard Rooms	....	Wheeler and Lodge, Architects, Horsham.
Oct. 1	Cymmau, Wales—Alteration to Chapel	....	W. Lewis, Cymmau.
,, 2	Sowerby Bridge, Yorks—Nine Houses	....	M. Hall, 29, Northgate, Halifax.
,, 2	Handsworth, Staffs.—Stabling, Workshops, &c.	Urban District Council	E. Kenworthy, Engineer, Council House, Handsworth.
,, 2	Erith, Kent—Schools	School Board	W. Egerton, 12, Queen's-road, Erith, Kent.
,, 2	Hastings—Stabling, Loose Boxes, &c.	Corporation	P. H. Palmer, Borough Engineer, Town Hall, Hastings.
,, 2	Luton—Engine House and Engine Foundations	Brompton, Chatham, &c., Waterworks Company.	J. Taylor, Sons, and S. Crimp, 27, Great George-street, S.W.
,, 3	Basingstoke—Fifteen Cottages	Housing of the Working Classes Committee	G. Fitton, Borough Surveyor, Town Hall, Basingstoke.
,, 3	Lewes—Alteration and Extension of County Hall	East Sussex County Council	F. J. Wood, County Surveyor, County Hall, Lewes.
,, 3	Watford—Offices and Warehouse	Benskin's Brewery, Limited	C. P. Ayres, 14A, High-street, Watford.
,, 3	London, S.E.—Underground Urinal	County Council	Architect's Department, 13, Spring-gardens, S.W.
,, 4	London, S.W.—Electric Generating Station	St. Mary's Vestry, Battersea	W. M. Wilkins, Clerk, Municipal-bldgs, Lavender Hill, S.W.
,, 10	London, W.—Post Office Savings Bank	Commissioners of H.M. Works	H. Tanner, Office of Works, Storey's Gate, S.W.
,, 11	Tooting, S.W.—Asylum	Metropolitan Asylums Board	A. and C. Harston, 15, Leadenhall-street, E.C.
,, 12	Wolverhampton—Workhouse Infirmary	Union Guardians	A. Marshall, Architect, King-street, Nottingham.
,, 25	Swansea—Extension of Workhouse	Union Guardians	G. B. Haynes, 8, Fisher-street, Swansea.
	ENGINEERING—		
Sept. 22	Luton—Electric Lighting Plant	Town Council	A. T. Snell, Engineer, Suffolk House, Cannon-street, E.C.
,, 23	Leeds—Retort Installation of Twelve Beds	Gas Committee	R. H. Townsley, General Manager, Municipal-bldgs., Leeds.
,, 25	Guildford—Reconstructing Bridge	Rural District Council	N. Lailey, 16, Great George-street, Westminster.
,, 25	Ilfracombe—Plant	Urban District Council	W. H. Frentham, 39, Victoria-street, Westminster, S.W.
,, 25	Aylesbury—Underground Rain-water Tank	....	R. J. Thomas, County Surveyor, County Hall, Aylesbury.
,, 25	Weston, Pembridge, Hereford—Girder Bridge	Kington Rural District Council	F. Exton, Surveyor, Kington.
,, 27	Runcorn—Electric Lighting	Urban District Council	E. Marshall, Secretary, Town Hall, Runcorn.
,, 27	London, E.C.—Hauling Engines, &c.	Tredegar Iron and Coal Co., Limited	Office, 7, Fenchurch-avenue, London, E.C.
,, 29	Roughton, Norfolk—Tube Well	Urban District Council	A. F. Scott, Surveyor, Church-street, Cromer.
,, 30	Seaford, Sussex—Extension of Outfall Pipe	Urban District Council	W. H. Pawson, 3, Clinton-place, Seaford.
,, 30	Handsworth, Staffs.—Gas Engines and Pumps	Urban District Council	E. Kenworthy, Engineer, Council House, Handsworth.
,, 30	Winwick, near Warrington—Electric Lighting	Asylum Committee of Visitors	J. P. Muspratt, Clerk, County Offices, Preston.
Oct. 3	Blackpool—Widening Railway	Lancs. & Yorks. & L.N.W. Joint Rlwys.	Engineer, Hunt's Bank, Manchester.
,, 3	Blackpool and Kirkham—Railway	Lancs. & Yorks. & L.N.W. Joint Rlwys.	Engineer, Hunt's Bank, Manchester.
,, 3	Sligo—Heating and Ventilating Asylum	District Lunatic Asylum Managers	Sir T. N. Deane and Son, 3, Upper Mervion-street, Dublin.
,, 6	West Bridgford, Notts.—Septic Tank	Urban District Council	W. Pare, George-road, West Bridgford.
,, 9	Rotherham—Electric Lighting	Corporation	H. H. Hickmott, Town Clerk, Rotherham.

Property and Land Sales.

FREEHOLD BUILDING ESTATE, fronting on main road and close to golf links and Highgate Woods, seven minutes' walk from Muswell Hill and East Finchley stations. To be LET on lease or SOLD in plots. Liberal advances to responsible builders if required. For plans and particulars, apply to Mr. GEORGE H. PAINE, Architect and Surveyor, 6, Stoke Newington-road, N. 5

Under deed of assignment. In the matter of Fred Hart, monumental sculptor, stone and granite works, tile merchant, &c., 48, 85 and 86, Gloucester-road, Brighton.

MESSRS. OLIVER WESTON and SON, are favoured with instructions from the Trustee, Oscar Berry, Esq., F.C.A. (Oscar Berry and Carr), to offer for SALE by PUBLIC TENDER, in four Lots:

Lot 1.—The important, centrally-situated, Freehold properties, 85 and 86, Gloucester-road, 4, Trafalgar-terrace, together with the leaseholds, 46, Red Cross Street, and 7, Pelham-street, Brighton.

Lot 2.—The centrally-situated Leasehold, 48, Gloucester-road, Brighton.

Lot 3.—The entire stock-in-trade of monuments, chimney-pieces, marble, stone, &c., amounting to £412 2s. 6d. at cost or stock book prices, which will be sold at a discount therefrom.

Lot 4.—The entire stock of plain and fancy tiles, amounting at cost or stock book prices to £282 12s. 9d., which will be sold at a discount therefrom.

The stock will be on view at 85 and 86, Gloucester-road, Brighton, on Monday, September 18th, 1899, from 10 a.m. to 4 p.m., and following days. Tenders must be delivered by 12 o'clock on Monday, September 25th, 1899, under seal, and marked, "Tender *re* Hart Estate," and addressed Messrs. Oliver Weston and Son, care of Oscar Berry, Esq. (Messrs. Oscar Berry and Carr), Chartered Accountant, Monument House, Monument-square, London, E.C.

Catalogues and forms of Tenders may be had on the premises, or of OSCAR BERRY, Esq., of the firm of Messrs. OSCAR BERRY and CARR, Chartered Accountants, Monument House, Monument-square, London, E.C.; or of Messrs. WOODS, HOLMES and JOHNSON, Solicitors, 64, Ship-street, Brighton; and of the Auctioneers, Messrs. OLIVER WESTON and SON, 25, North-road, Brighton. 1

BLUE COAT GIRLS' SCHOOL CHARITY ESTATE, GREENWICH, S.E.

To be LET by TENDER, on a repairing lease for 21 years, eleven conveniently-situated FREEHOLD HOUSES, with gardens, being Nos. 133, 135, 137 (The Little Wanderers' Home), 143, 145, 147, 149, 151, 153, 155, and 157 Greenwich-road, Greenwich, S.E., estimated to produce a rental of about £428 per annum, situate in a populous district, on a main road, and within two minutes' walk of Greenwich Station (S.E.R.)

Tenders for the above are invited, and must be sent in by SEPTEMBER 23rd next to the Offices of Messrs. BATCHELOR and BATCHELOR, the Clerks to the Charity, 52, Croom's-hill, Greenwich, S.E.

Intending takers may view the property at any time by permission of the respective tenants, and particulars and conditions of letting, and forms of Tender annexed, and any further information desired may be had gratis at the Offices of Messrs. BATCHELOR and BATCHELOR, the Clerks to the Charity, 52, Croom's-hill, Greenwich, S.E., and 15 and 16, Outer Temple, Strand, W.C.; and of Mr. THOMAS DINWIDDY, Croom's-hill, Greenwich, S.E., the Charity's Surveyor.

An acre of singularly valuable Freehold land, 270 yards from the Stock Exchange and opposite the north end of Throgmorton-avenue, Throgmorton-street, City, to be let upon 80 years' building lease direct from the Corporation, with a fully-licensed house thereon.

MESSRS. REYNOLDS and EASON are instructed by the Bridge House Estate Committee of the Corporation of the City of London to LET by PUBLIC AUCTION, at the Mart, Tokenhouse-yard, in OCTOBER, 1899, the above singularly valuable SITE of 44,038 square feet, with extensive frontages on Blomfield-street, London Wall, and Finsbury-circus.

Particulars, plans, and conditions of letting may be had, when ready, either of the City Comptroller, or the City Surveyor, Guildhall, E.C.; at the Mart, Tokenhouse-yard; and of the AUCTIONEERS, 43, Bishopsgate-street Without, E.C.

Unique Sites for Docks and Shipbuilding, extending from Chepstow Station to River Wye.

MESSRS. DRIVER, JONAS, and CO. beg to announce that they are honoured with instructions from his Grace the Duke of Beaufort to SELL by AUCTION, at the Beaufort Arms Hotel, Chepstow, on THURSDAY, OCTOBER 5th, at 10.30 a.m., in One Lot, 40 acres of valuable FREEHOLD LAND, similarly situate to the Llanarth Docks, Newport, Mon., having a frontage of about half-a-mile to the River Wye, and forming the entire block between the river and the Great Western Railway. The Chepstow Station is on the property, which has direct access from the town by the Station-road, and is especially suited for new docks, shipbuilding yards, engineering modern manufactures, or other large industrial enterprise, for using the tidal power, here the second highest in the world, the exceptionally favourable circumstances of which are seldom found in large ports. It includes the Chepstow Cattle Market, bonded yard, landing stage, and rich meadows, all let, at £140.

Printed particulars and plans may be obtained of Messrs. WILLIAMS and JAMES, Vendor's Solicitors, Norfolk House, Thames Embankment, London, W.C.; of JAMES GRAY, Esq., Solicitor (Messrs. Pemberton, Cope, and Gray), 5, New-court, Lincoln's-inn, London, W.C.; of S. H. COWPER COLES, Esq., Estate Office, Troy, Monmouth; and of Messrs. DRIVER, JONAS, and Co., Surveyors, Land Agents, and Auctioneers, 23, Pall-mall, London, S.W.

CITY OF LIVERPOOL.

SCHOOL OF ARCHITECTURE AND APPLIED ART, UNIVERSITY COLLEGE.

Sixth Session 1899-1900, commences Monday, October 2. In Architecture, a Two Years Course of preliminary training is provided for students to pass through before entering an Architect's office. Classes are also held in the Day and Evening for pupils and assistants already in offices. An Advanced Class in Design is held in the evening. Classes are held in Modelling and Designing Ornament and the Figure suitable for Sculptors, Modellers, Carvers, Plasterers, &c.; in Drawing, Painting and Decorative Design, the last being divided into two classes, specially arranged for students who wish to take up Decorative Work; in Wood Carving and Wrought Iron, especially in their relationship to Architecture; in Brass and Copper Work; in Stained Glass; in Enamelling, in Furniture and Fittings Construction, and in Furniture and Fittings Design.

Six Free Studentships are offered to the day classes, and Crafts' Studentships for students before entering their apprenticeship.

Eighteen Free Studentships are offered to the evening classes, two to each of the above-mentioned classes. Prizes are awarded at the end of the session to the most successful students.

For details of Classes, Free Studentships, Prizes, and all further particulars, apply to the Director,

PROFESSOR SIMPSON,
2 University College.

R.I.B.A. EXAMS. PREPARATION, personally or by correspondence, in three, six, nine, or twelve months' courses. Architectural Lending Library. Special three months' finishing courses.—For full particulars apply to Messrs. HOWGATE and BOND, Associates R.I.B.A., Perchard House, 70, Gower-street, W.C. (close to the British Museum.

ANSELL and MALLOWS, Architectural Draughtsmen and Quantity Surveyors, 21, Buckingham-street, Strand, W.C.

ARCHITECTURAL Institute, Society of Architects, and Civil Service Technical Examinations. Preparation by correspondence, personally, or in residence. Seventeen first places.—MIDDLETON and CARDEN, 19, Craven-st., W.C.

PLANS, Applications, &c., Prepared by an experienced Architect. Advice given in Building Act questions, and disputes settled.—Address, "Architect," 17, Algarve Road, Earlsfield, S.W. 1

FOR SALE in the MIDLANDS, Builder and Contractor's BUSINESS and PREMISES, including a first-class and nearly new Steam Joinery Plant, with extensive Shop, Stables, and Residence, nearly new, and specially built for the business. Last ten years' annual income from £600 to £700. Will clear for £1,800.

Reason for selling, going out of business. The above in a healthy country district.—Apply Box 1165, "BUILDERS' JOURNAL" Office. 3

SANITARY INSPECTORS' EXAMINATIONS.—An Associate of the Sanitary Institute thoroughly PREPARES CANDIDATES for the above Exams. by correspondence; no books are required.—For particulars and testimonials apply, "Certified Coach," "Malabar," New Eltham, S.E. 11

APPOINTMENTS VACANT.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

PUPIL.—Old-established firm of Architects and Surveyors has VACANCY for well educated youth as Articled Pupil. Immediately under principals. Moderate premium.—HUKINS and MAYELL, 76A, Westbourne-grove, London, W. 3

APPOINTMENTS WANTED.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

YOUNG ARCHITECT, A.R.I.B.A.,
ASSISTS in the
PREPARATION of DRAWINGS, TRACINGS, &c.,
at his own Office.
G. SCORER, 28, Newman-street, W.

QUANTITIES prepared, specifications written, works measured, and variations adjusted by reliable London Surveyor. Over twenty years' experience. Special terms by arrangement.—"Surveyor," office of the BUILDERS' JOURNAL. 15

ABLE ASSISTANCE.
WORKING and DETAIL DRAWINGS,
DESIGNS, PERSPECTIVES, TRACINGS.
QUANTITIES and SPECIFICATIONS,
DIFFICULTIES of PRACTICE advised upon.

An Architectural Causerie.

The Coddled East and the Neglected West. To journey eastwards, across the many miles of London's streets, from the far western suburbs, is to obtain an object lesson badly needed by those who, sufficiently well acquainted with the developments of the Metropolis in other directions, have acquired no other knowledge of the East than the hazy and incorrect ideas obtained by reading about it in the papers. For twenty years, or more, past, the East End of London has been much written about and missionized. Dock-strikes, recurrent bad times, Society's astonishing interest in the costermonger, and the short period when "slumming" was fashionable—to say nothing of the picturesque writings of journalists on the "horrible East"—have created an impression that, when once Aldgate is passed, there is nothing but a dreary stretch of mean and squalid streets, inhabited by ferocious savages, until, after many miles, the country is reached again beyond Ilford. Now, so far from the slums of Whitechapel being unique, there are undoubtedly as bad—if not possibly worse—to be found in the South, North, and West; in the Borough, up Pentonville way, or in those horrible Central London and West End slums, Eyre Street Hill, where the Italian colony makes a plague-spot, Seven Dials, and the beastly squalor around Lisson Grove.

Where the untravelled in East London go wrong is to imagine that, because there are slums in Whitechapel and Poplar, the whole district should partake of that character. As well believe the West End to be nothing but a poor quarter because of Seven Dials and Lisson Grove aforesaid. A journey down either the Mile End Road or the Commercial Road will help to dispel these uninstructed notions. To begin with, those are thoroughfares of a generous width for which one may look in vain elsewhere in London, and they are by no means so shabby, for instance, as those other main thoroughfares out of London, the Old Kent Road, Wandsworth Road, the Caledonian Road, or the long series of roads that run up to Highgate Archway. The East is not so dolorous a place, either, for a feature of it are the numerous theatres and music-halls on the way, while the churches, chapels, and institutions for the advancement and recreation of the people are more numerous still. Many of the side streets may be uniform and dull, but they are of that firm Puritan respectability which is the last attribute the untravelled would expect to find here.

In fact, the great mass of the East is a solid working-class population of by no means a poverty-stricken kind. For them have been established of late years many institutions that aim at their higher education. Toynbee Hall and the People's Palace are typical, and things are done for these people which no-one would dream of doing for the similar classes in the other quarters of London. If you are a working-man in the East, you will have University Settlements and Extensionists on your track, and free picture exhibitions galore: if, on the other hand, you are a West-end proletarian, the pictures and the institutions are there, but you have to pay to see them or to secure their advantages. If we adventure further east down to Bow and Stratford, and so on to Manor Park and Ilford, we find in Bow old houses of a grave and dignified aspect, given over to working men's clubs; while at Stratford, which is a waterside place, with wharves and mills and such like evidences of commercial activity, there are of course places of an uninviting aspect, along the muddy waters of the river Lea. To this succeeds Upton and Manor Park, places which could, in their trim and excellently-designed villas, and fine modern shops, give a hint to suburbs of a higher social standing.

West Ham, however, is the culmination of cultured modernity. Here, in the West Ham Technical Schools, a municipal undertaking, we find a building with an exquisitely beautiful elevation for which we might seek in vain in the western suburbs. Well-designed ornament gives a fine air to the general aspect, while the well-equipped workshops and the Art Schools are doing for that district a good work which other parts of London might well copy. Such unstinted architecture as this is, indeed, an education of itself in the beautiful, to which it is a delight to turn after the half-hearted attempts at, for instance, Bedford Park, where they teach Art in what is fondly imagined to be a "Queen Anne" building that really looks like a workhouse, and is, in fact, built on the cheapest and shoddiest lines.

C. G. H.

OLD COTTAGE, RANWORTH. SKETCHED BY FREDERICK VIGERS. (*See p.* 113).

Cathedrals and Sanitation.

The educational potentialities of our grand cathedrals, as many abler pens than mine have often pointed out, are immense, and that not merely from the purely artistic or the rigorously technical points of view—no, their value for inspiring lofty thoughts reaches far wider than that. Such lofty thoughts, too, need not be divorced from the practical and the utilitarian. But it must be confessed that their silent teaching in the matter of that important social subject, sanitation, is not of the best. Indeed, it is of the worst. It was a natural desire, and may perhaps have been a commendable one, to turn these sacred edifices into national or local Valhallas. However much sentiment may approve of this, hygienically the conception is all wrong. Science, and, indeed, religion too, teaches us that dust should return unto dust, that all that is mortal of man should be reunited with mother earth. Any violation of this law entails dangers unpleasant to contemplate. Intermural interment is necessarily an infringement of this natural law, and by retarding the normal rapidity of decay and the healthy reassimilation of elements, the atmosphere of cathedrals and churches is unavoidably polluted, and sometimes with serious effects. I have known old churches, close to rivers, where at certain seasons of the year the ground water rose so high as to invade the vaults, breaking up the coffins, setting them floating, and rattling under the pavement. We need only think of the possibility of death from infectious diseases to shudder at the possible results of such a state of affairs. The fact is, sanitarians cannot approve of intermural burial. It is doubtful whether our churches and cathedrals would lose much in the artistic and sentimental way from the absence of tombs, and, at all events, commemorative monuments would be safer, cleaner, and more in accordance with the dictates of Nature and of pure religion. What a truly ghastly sight is the crypt of the Abbey Church of St. Denis, with its royal coffins, railed off in a cage, mouldering before the public gaze.

It is pleasing to find that these views are held by the Church Sanitary Association and the Church of England Burial, Funeral, and Mourning Reform Association. Indeed, the latter society, while discouraging burials inside churches—preferring earth-to-earth burial and commemorative tablets inside the sacred fanes—has memorialised our Cathedral and Abbey authorities to insist upon certain precautions being taken whenever such intermural interments do take place—and even suggesting cremation as advisable under these conditions. This is the teaching of common sense and true piety, of love for the dead and respect for the living. It is also sound science to discourage burials in vaults, whether inside or outside buildings. Indeed, these two societies are doing excellent work in propagating wholesome doctrines in the affairs of the world, which, be it noted, are most influential on spiritual health. The parsons can do much to bring home to everybody, to "vulgarise," the teachings of hygienists so that they may become the daily commonplaces of every individual in the community. Until this is done, architects and others will find their battles on behalf of sanitation hard in the extreme. To come back to our starting point. Our cathedrals and churches should teach the highest lessons in all matters—in sanitation no less than in other affairs of this life.

G. C. R.

On Reflection.

Beauty v. Sanitation.

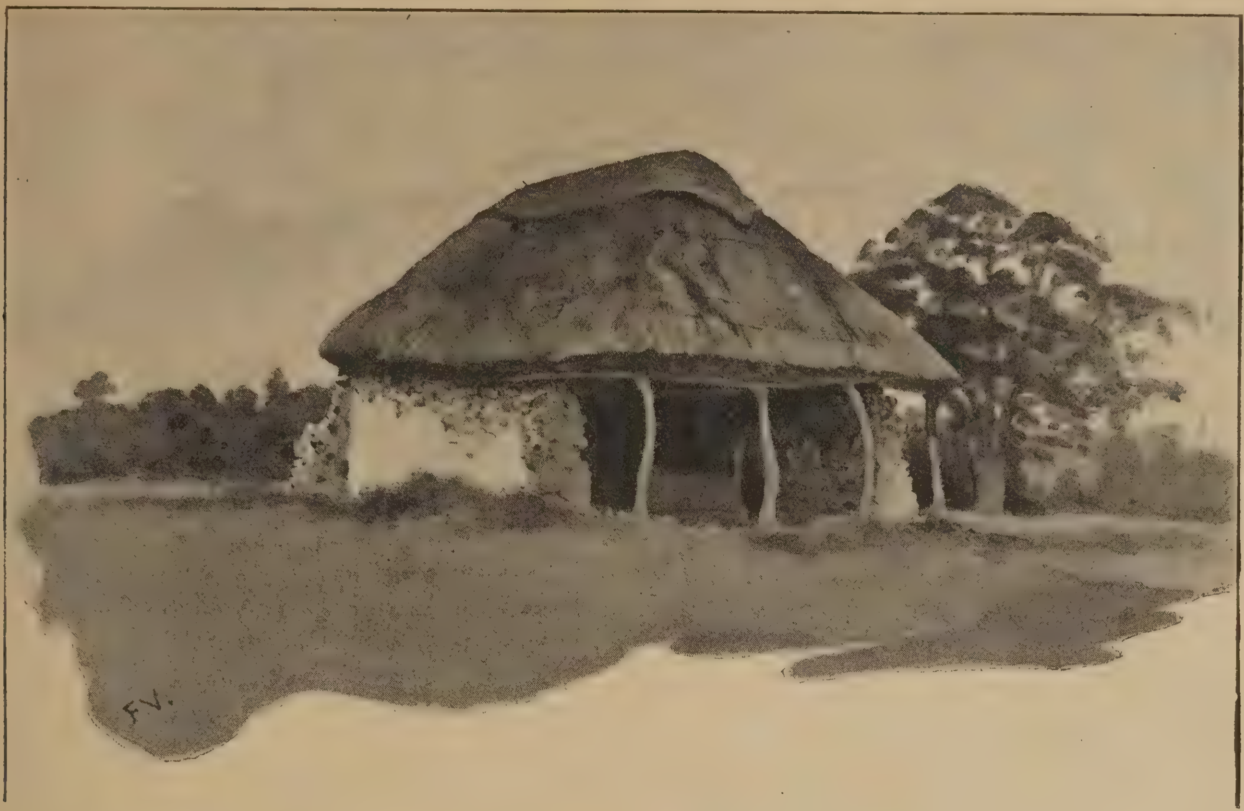
Art and sanitary science do not always, or even generally, go hand in hand. The picturesque country cottages in which architectural sketchers delight are often woefully insanitary, while the "desirable villa residence with all the latest improvements," which is an eyesore to the artistic soul, is often all that the sanitary expert could desire. It would be foolish and irrational to expect that the advance of sanitary science should be checked in deference to the artistic susceptibilities of anybody; all reasonable men must welcome whatever makes for the improved health of the community. Nevertheless we are entitled to demand that sanitarians should exercise some discretion in the application of their useful science. When, for instance, a lovely valley, and a possible public park, is in danger of being ruined by the erection of a dust destructor, there is ample justification for a vigorous protest. This untoward fate is likely—unless a local agitation succeeds in preventing it—to befall the beautiful Bolehills in the neighbourhood of Sheffield, the locality which, on account of its great natural beauty, Mr. Ruskin chose as the scene of his museum. A dust destructor is an admirable thing in its place, but Ruskin's valley is emphatically not its place, and we hope public opinion in Sheffield will prove strong enough to compel the Corporation to find a more fitting site for it.

"Advance Australia."

It is now one hundred and eleven years since the British first settled in Australia, at Port Jackson. In the usual course of events these brave adventurers built themselves huts and storehouses, and then, turning their attention to religion, they erected a wooden church. This was totally destroyed by fire, and so, in July, 1793 (five years after the foundation of the colony), the first stone of a church dedicated to St. Philip was laid by the Lieutenant-Governor, Major Francis Grose. This, says Mr. James Barnet in a recent number of the Journal of the R.I.B.A., may be regarded as the dawn of Architecture in Australia. The church, however useful it may have been, was very hideous, and, in some respects, it is a pleasure to record that it was pulled down in 1856. Sydney had a great champion in the person of Governor Macquarie, as it was under his direction, and owing to his exertions, that many large and important buildings were early erected. The year 1851, that in which the discovery of the gold fields was made, was, naturally, the era of a new civilization, for with the acquisition of money came all the innovations which this magic touchstone can effect. Costly new buildings sprang up, and were followed by larger and more costly ones, with the result that a visitor to Sydney would now be astonished at the advances which the architect, backed up by the Government and by private capitalists, has made. The town now boasts of six principal theatres, besides music halls, and no fewer than seven arcades of shops, while at the present time more than one hundred architects practice there. In a later number of the journal referred to above, Mr. Lloyd Tayler tells the same tale with regard to Melbourne and the colony of Victoria. During the last sixty years the population of the former has grown from 5000 to about 450,000. What a contrast it must be to the man who walked through the streets of the town in 1851—when they were imperfectly formed and drained, generally unpaved, and unlighted—to stand in front of the new General Post Office, or the Law Courts, or the Parliament House! As yet, the architecture of Australia has been imitative, and where certain attempts have been made at originality it cannot be said that an artistic success has been achieved. Still, the spirit of evolution pervades everything, and at this juncture it may, perhaps, be fitting to ask: "Will Australian architects form an architecture of their own"—one which will be noble in form, harmonious in design, tasteful in detail, and commanding in aspect? The future will decide.

Baths for the Poor.

It has often been urged, and no doubt in the majority of cases with truth, that the poor do not keep themselves clean. To convince anyone that this really is so, it is only necessary to take a walk round the slums of a city and to see the squalor and filth and general aspect of negligence which is predominant. It is a curious fact that poverty seems to regard cleanliness and tidiness as a form of affectation, and a thing to be avoided at all hazards, and so we have always with us "the great unwashed." To be fair, it should be admitted that the poor are not entirely to blame, for to them the laying-out of the little money they have for bathing purposes would seem a luxury to be indulged in only on rare occasions. Now, the engineer and chief superintendent of baths at Liverpool (Mr. W. R. Court) comes forward with a practical suggestion. He says there are at present in his city six central public baths establishments where a hot bath can be had for 2d. These are not patronised by the exceedingly poor. Why? Mr. Court is inclined to think that, so far as grown-up people are concerned, the very poor do not care to come in contact with those better clothed and in more affluent circumstances than themselves. Then there is the question of distance. People who have to walk from a quarter to half a mile for a bath, don't use the baths, and if the poor are to be cleansed, the means of doing so must be taken, as it were, to their own doors. The principle to work out is to make the residents in poor districts habitual bathers from choice, and not by compulsion. Therefore plain, substantial, buildings must be erected where a bath can be obtained for a very low sum, say 1d. There has been an active movement going on in Germany during the last twelve years for the establishment of such baths, the subject being first brought to notice by a paper read by Dr. Oscar Lassar before the German Public Health Association in 1886. In Vienna there are now eleven people's baths establishments which have proved an entire success. America has had a similar experience, and the "Lassar-Grove" type of bath (which is without doubt the best) is now being introduced into this country. In people's baths of this kind, the ordinary slipper bath is done away with. "Rain baths," says Mr. Court, "are, from a cleansing point of view, undoubtedly the baths of the future." In a slipper bath the bather washes the dirt off his body and remains in the same water. In the rain bath, as the dirt is washed off it is carried away into the drain, leaving the bather perfectly cleansed. By providing baths for the poor, municipalities would be promoting the health of their cities and the welfare of the inhabitants. The Liverpool Corporation Baths Committee held a meeting on September 20th, when it was decided to recommend the Council to adopt the scheme referred to above, and to erect one bath in a densely-populated part of the city as an experiment. The probable cost of the establishment would be between £1,500 and £2,000, not including the site, and it would require about £300 a year to maintain. Such a wise and sanitary proposal certainly deserves support; we hope the experiment will prove so successful that it will not be very long before "people's baths" are established in every populous centre.



REMAINS OF THE PRIORY, RANWORTH. SKETCHED BY FREDERICK VIGERS.

IN AND AROUND RANWORTH.

By FREDERICK VIGERS.

THE parish of Ranworth, in Norfolk, interesting to archæologists and architects at all times, has become especially so at the present time because its chief attraction, from their point of view—the church of St. Helen—therein has lately been placed in the hands of the restorer.

The sketch on page 115 gives a very fair idea of the exterior of the church, which was built in the fifteenth century, and is beautifully and simply designed.

The details, such as the external arch at the entry of the south porch and the niche above it, the doors, and the remains of the perpendicular windows, are exceptionally good.

The interior is very plain, and before the work of restoration was begun had a very forlorn and squalid appearance.

The roof, which at the beginning of this century was a very rich example of that kind which is often seen in the churches of the same date (specimens can be seen at St. Peter Mancroft in Norwich, and at Martham), has been replaced by one of the meanest possible kind, which does not even serve the purpose of excluding the wind and the rain.

But the glory of Ranworth Church is the Rood Screen, which is probably the best example of the sort in England. It is divided into three portions; the central consists of six open arches on either side of a larger one, by which the chancel is entered from the body of the church; the whole supports a delicately groined and richly decorated ceiling, above which stood the Rood itself. In the panels beneath the six arches are figures of twelve male saints, six on either side, clothed in vestments richly painted and gilt, and these are for the most part in a very good state of preservation.

It is remarkable that these vestments are in many instances painted with sporting subjects, such as hawking after swans, duck, and hares; and that the parish is still famous for its waterfowl.

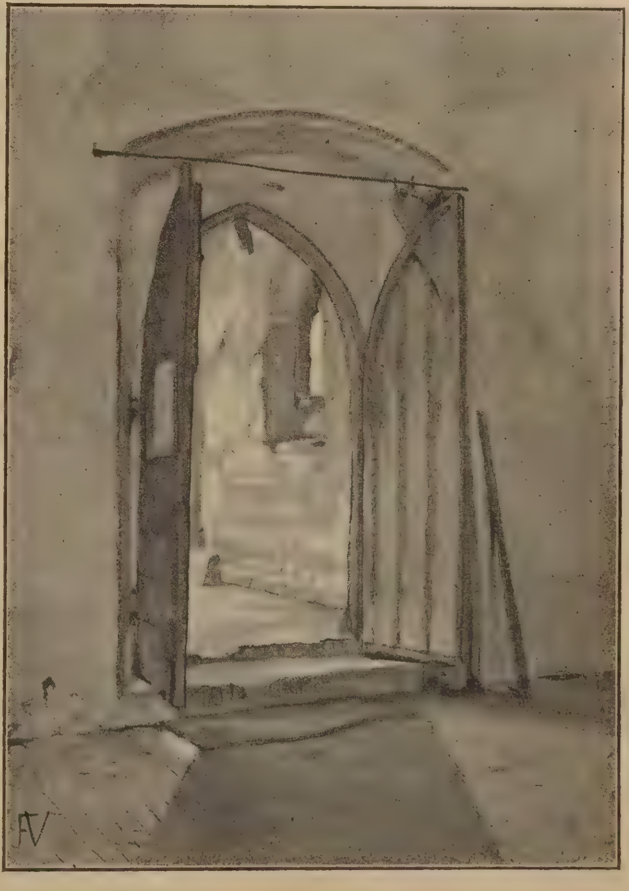
On either side of the central portion small chapels are formed by a reredos of larger panels and a return, at right angles, to the Screen itself. In the south chapel the panels, having felt the full effects of damp and sun, are very much decayed, and considerable portions of the colour have crumbled away in the last few years. In the north chapel is a very peculiar painting, representing St. John the Baptist, which has never been finished; and in the lefthand corner of this chapel is the staircase, opened only recently, leading up to the top of the Screen.

One is told of a tradition that there is a painting on the west wall, near the door, at the foot of a staircase (also recently opened), leading to a chamber over the north porch, and that it was covered with whitewash because the squire of that day was offended by the eyes in it staring at him during service! It is said of the same squire that he had the bells struck with sledge hammers on the occasion of a wedding in the family, because the ropes were too rotten to pull, and that large lumps were knocked out of them in doing so. All the traditions of that sort have been fathered on him, whether rightly or wrongly I cannot say.

Next to the church in point of interest comes the Priory, the few remains of which stand at the west end of the parish, and of them the most considerable portion is used as a barn. It is built of flint rubble, with large buttresses, and, having been repaired from time to time with red brick, it has a very picturesque appearance.

Close by this is another building, also built of the same material, which is now used as a cart lodge. It consists of a central room with the remains of the walls, which went to form others, all of them having been coated with plaster.

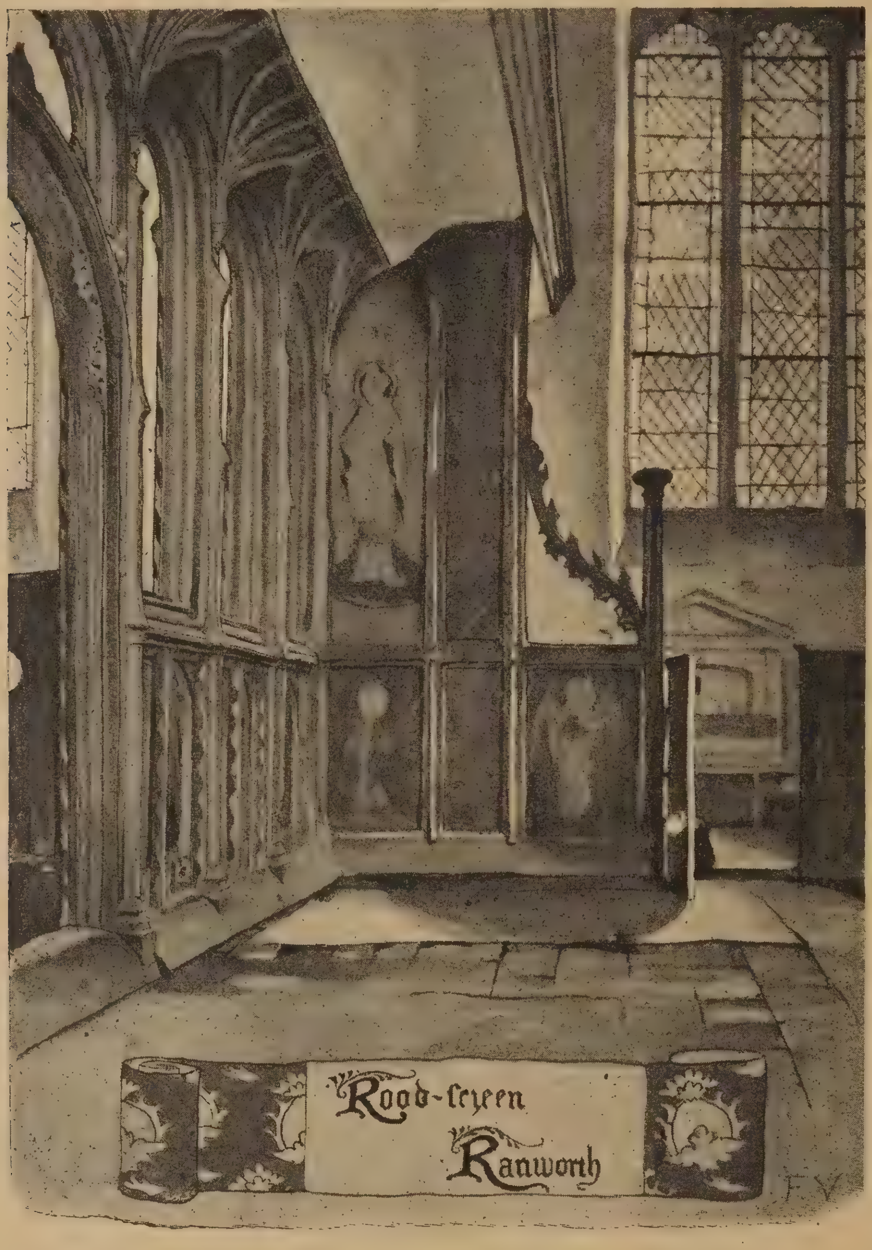
At the north-west corner of the buildings is the burial ground of the Monastery, various



SOUTH DOOR AND PORCH, RANWORTH. SKETCHED BY FREDERICK VIGERS.

stone coffins having been dug up in forming the osier bed which is there now.

With the exception of the cart lodge above mentioned, all the monastic buildings seem either to have been converted into farm premises at the time of the Dissolution, when the house known now as the Old Hall was built, or the materials from them were used in building the greater part of the better sort of houses in the parish. One comes across fragments of wrought stone bedded in the latter brick houses; and there is a considerable collection of it, such as carved capitals and shafts to pillars, portions of mouldings and various other objects, in the garden of Miss Kerrison, the lady of the manor. The Priory of Ranworth was part of the property of the Abbey of Langley, and at the Dissolution it was acquired by the family of Holdiche, a member of which, Thomas by name, son of Robert, lies buried in the church; according to the inscription on his monument he died in 1579.



SKETCHED BY FREDERICK VIGERS.

From the Holdiches it passed by marriage to the Sidleys; from them to the Houghtons; and, lastly, to the Kerrisons, in whose possession it now is.

The old hall itself is a very picturesque Tudor house of red, crossed with a network of black, brick.

The mullions to the windows and the roofs to the steps of the gables are of terra cotta.

The charm in the appearance of the old house, and also of the large barns which stand near it, lies in the very good, and at the same time sturdy-looking, proportions of them all, with, of course, the additional beauty which Time has given.

All appearance of former respectability and every sort of interest has disappeared from the interior, and the house is now occupied by farm labourers.

In the garden stands a quaint old pavilion, which till quite recently was surmounted by two graceful pinnacles of moulded brick and stone; but these have now fallen down, and the fragments become scattered about.

The parish is full of traditions (there is a ghost story in connection with this very old house) and is altogether a very interesting and, on account of its position by the side of the Broads, a very beautiful place.

Mr. William Willmer Pocock, F.R.I.B.A., died at his residence, Glendore, Tunbridge Wells, on Monday, last week, in his 86th year. He was the architect of the late Rev. C. H. Spurgeon's Tabernacle in Newington Butts. He also designed several other public buildings, the last being the hall of the Carpenters' Company, in Throgmorton Avenue. He was educated at King's College, where he received the honour of A.K.C., and subsequently passed the B.A. examination in the London University.

CONSTRUCTION OF COTTAGES FOR AGRICULTURAL LABOURERS.*

By GEORGE H. SMITH, P.A.S.I.

THE great depression of prices and diminished incomes received by agricultural landowners of recent years has made the question of cost enter largely into the consideration of cottage building. A labourer earning a wage of 14s. per week, with a wife and family to maintain, cannot be expected to pay a rent sufficient to invite speculators to build for investment, and this being the case, it would seem that £300 per pair of cottages is about the highest amount that can usually be spent in building.

Every cottage should contain a parlour and kitchen, with small larder adjoining, on the ground floor, and not less than three bedrooms upstairs. As a general rule, the size of the parlour and kitchen should not be less than 150ft. superficial, and, for the bedrooms, 100ft. for one and 80ft. for the others should be the minimum. The height of the rooms on the ground floor should be 8ft. 6in., and upstairs 8ft. is the minimum, but if the ceiling is coved they should not be less than 5ft. at the lowest part, with 9ft. for an area equal to one-half the floor surface.

The front door should never open directly into the parlour, but into a lobby at the foot of the staircase, which tends to better ventilation upstairs.

The kitchen should have a strong open range in preference to a closed kitchener, on account of its being more cheerful when the room is used for sitting in. A small stoneware white glazed sink should be provided in a convenient corner, and it is very desirable to fit up a strong enamelled iron bath near the fireplace, with a deal hinged top to form a seat when not in use. The hot water can easily be supplied from the range by means of a pail.

All bedrooms should have fireplaces to assist in the ventilation of the room, and should also have additional means of air-inlet and outlet, such as a plain bracket-box with an air brick and flue through the wall, and an outlet into a special flue in the chimney.

The external walls should never be less than 9in. in thickness, even if covered externally with rough cast or tile hanging, and on no account must the damp-proof course be omitted.

The ground-floor can be cheaply constructed with deal blocks, 9in. by 4in. and 2½in. or 3in. thick, bedded in pitch and tar, and laid on a 6in. bed of concrete cement. The upper floors, the author considers, may, with great advantage and less expense than usual, be formed of 3in. deal decking, tongued and grooved and caulked with tow, with the upper surface twice varnished, carried on timber beams about 4ft. apart.

Partition walls should always be of brick in cement.

The roofs should be boarded and felted, as this greatly lessens the cost of repairs.

Party walls should never be carried through the roof, as it adds considerably to the cost, besides increasing the risk of rain entering.

The author finds that one of the most successful methods of dealing with the waste water is to treat it by sub-irrigation by a tile drain down the garden; the solid excreta being collected in a galvanised iron waggon, with a capacity sufficient to require emptying once a week.

The water supply can often be obtained by means of a tube well at much less cost than sinking an ordinary brick-steined well, and at the same time preventing any risk of contamination of the water supply.

In conclusion, the author would insist that only the best materials and workmanship should be used; although, perhaps, more costly at first, there is a considerable saving in the annual repairs afterwards.

---

* Abstract of a Paper read before the Annual Congress of the Sanitary Institute, held at Southampton on August 29th, 30th, and 31st.

MOSAIC.

I.—SOME GENERAL PRINCIPLES AND REFLECTIONS.

By GEORGE BRIDGE.

MOSAIC is an absolutely permanent form of applied colour decoration employed as a component part of an architectural scheme. It is applicable to floors, walls, and ceilings, and is as suitable to domestic and commercial buildings as it is to edifices of a more ecclesiastical character. From its imperishableness it is equally serviceable as an external or internal decoration.

"Nuttall's Dictionary" gives a very misleading definition, although, perhaps, a popular one, namely, "Mosaic—In painting a species of representatation, &c." The dictionary makes the very common error of classifying mosaic under painting instead of describing it as an auxiliary in architecture.

The method of working is determined entirely by the position the work is to occupy, and this also governs the size and shape of the tesseræ. Thus pavements, hearths, firebacks, dadoes, and all work in similar positions should be finished with a perfectly smooth surface. This is self-evident in pavement work, and the rule applies to all work which from its position is liable to contact with passing bodies. When work is higher than six feet it can be finished with a fairly rough surface, and the higher the position of the mosaic the coarser should be the execution, as there is a certain texture in mosaic only obtainable by a studied coarseness in the method of manipulation.

Design for mosaic pavements should be extremely simple, but while keeping it flat and conventional, the draughtsman should remember that he has a perfectly free choice as to the form and subject to be used in the mosaic. The nature of the material gives him greater freedom than when designing for tiles; indeed, it is almost grotesque to see a mosaic pavement executed to a design that has been reduced to the narrow limits imposed upon the tiler, who must necessarily confine himself to severe geometrical patterns.

Wall ceilings and similar spaces can be treated with infinite variety of design, and the tesseræ being worked into a putty mastic may be of any shape or size that will suggest itself as the most serviceable for the position occupied, and that will most easily assist the flow of the design.

The most perfect architectural schemes owe a great deal to the assistance rendered to them by sculptured and coloured decoration. Indeed, no building can be considered complete without the aid of colour; if it has not been suggested in the original design, time, in all cases, lends its help to supply the deficiency. One need not be a great traveller to know buildings that have received considerable interest and beauty from natural colouring, and, indeed, many bad specimens of architecture that have been adorned and rendered beautiful by Time's tender covering.

There is a great need for applied colour upon the external elevations of London buildings, and mosaic is the art that suggests itself as being the most legitimate form such colour decoration should take. It is the most beautiful, as it is capable of greater variety and richness than any other architectural decoration.

It is the most durable form of applying colour, as so long as the building upon which it is placed exists the mosaic, being imperishable, will exist also.

Mosaic has suffered very great neglect of latter years by architects, artists, and art critics. All other crafts have been brought into popularity by being written about and practised by architects and artists, but mosaic has been almost totally ignored. Of course, there are the experiments at St. Paul's Cathedral, but these are the solitary instances in all London. Circulars sent out from galleries inviting specimens for art and craft exhibitions, mention every art and craft but mosaic. Critics when writing of the advance made in other art crafts, never seem to remember there is such an art as mosaic. Mosaic is not taught at any of the technical schools where not only every art, but every trade is taught, from plastering to jewel setting. At the Paris Exhibition mosaic is certainly given a space, but it is as a trade only. At the Royal Academy the president and council will not accept mosaic for exhibition.

Mosaic is an art that should certainly be taught, not only in the technical schools, but at all institutions where Art is taught, so that artists as well as architects, would thoroughly understand how to design for the work—the limitations imposed by the material, and the proper position a mosaic should take in an architectural scheme.

RANWORTH CHURCH, NORFOLK. SKETCHED BY FREDERICK VIGERS.

At present a student has very few opportunities to study mosaic work, or even other forms of colour decoration. In most cases the methods adopted are only instances of what to avoid from an architectural point of view.

In the streets, the more radical of our architects, in their desire to remove the stigma of want of appreciation of colour, have gone to the opposite extreme, and in a few instances have built their elevations from footings to parapet of coloured glazed bricks. The consequence is that in our chief thoroughfares are prominent buildings, looking like bold advertisements for mustard, chocolate, blue, sealing-wax, and other crude commodities, the hues of which, in their primary intensity, are more calculated to catch the eye, and give satisfaction to the feminine youth of Whitechapel than to be welcomed as an architectural feature by architects who may be practising in the vicinity. One has only to imagine a compulsory existence in a street of houses, the fronts of which have been erected with glazed bricks or faience of the tint of mustard, to appreciate the want of taste displayed by architects who use these colours in the wholesale manner indicated.

Apart from these very few hot-headed revolutionists, the architectural profession is as conservative in its prejudices and tastes as most other British institutions and professions. Mosaic is not used or specified as a decoration by other architects; therefore it never suggests itself to the individual Besides, there is always the trouble of finding designers and workers; and, again, nobody seems to know or care anything about the art, so they let it rest, and specify something from a numbered list. Even the architects who do specify that mosaic should be used are generally content with scrappy little patches of gold in their buildings, or if they intend to use larger panels they will set to work in the same manner that they would to order rain-water pipes. They will send for somebody's traveller who has pestered them a sufficient length of time, and ask him for a price per yard for ornament, a price per yard for draped figures, and a price per yard for more or less nude figures. His price being accepted, the traveller will submit designs, these will be accepted, or they will be altered to suit, and the architect is comparatively finished with the mosaic question; he will look at it at the finish to see if it is as flat as a plate glass window, wonder how it is all done, and give a certificate.

The way it is generally done by this class of so-called mosaic workers is this: The traveller is almost always a representative of an Italian firm (this kind of architect imagines that mosaic must come from Italy). The designs are stock drawings that have done service for centuries in all parts of the world, that have been enlarged, reduced, or cut up or added to from other designs, or used as stained-glass window patterns, or manipulated into frescoes. The design is faked to fit the architect's space and sent to Italy, where it is cut up into pieces and given out for the poorest class of Italians to take to their homes (the same way exactly as the sweaters among London tailors distribute their suits to be made). Whole families are employed in this way, and a fairly large mosaic is distributed among quite a number in all directions. These people buy the glass used from different makers, one tint from one firm, and, again, others from quite different people. The glass is stuck upon cardboard to the design, and sent to the firm, who, in turn, forward it to London, where the pieces are joined together and put into position like a Chinese puzzle. That is how they set about a work of art, and the best Italian firms, with world-wide reputations, reduce mosaic to this mechanical reproduction. No wonder architects, artists, and public think of mosaic only as a trade when they are in the habit of going abroad for it.

THE OLD HALL, RANWORTH. SKETCHED BY FREDERICK VIGERS. (*See p.* 113.)

Thus is the average architect conservative; if there is no desire for art, he will not go out of his way to induce his client to use it. He surrounds himself with numbered catalogues, writes his specification from them, and waits for some broader-minded member of his profession to strike out a new line of thought. Should the new line take with the public, then —good, bad, or indifferent—the idea is copied and reproduced, and often caricatured and overdone.

No; the average architect is not the one to whom the mosaic worker can look to produce a splendid mosaic, or indeed any big colour scheme. If he looks to artists, their training does not seem to fit them for any big work—it does not follow that because a man is a good portrait painter or landscape artist that he knows anything about the proper application of colour decoration. There are several instances in the Royal Exchange of the inability of the ordinarily successful artist to supply a decoration appropriately architectural in conception and execution. Here there were panels to be decorated, and the architectural scheme quite suggests that the decoration should be treated as a decorative design (and not in a pictoral sense), and that it should have been executed in some such material as mosaic, bronze, marble, or anything that being placed upon the walls would not only become a portion of the walls, but would last as long as the building existed. The artists receiving the commissions have simply painted pictures more or less perishable, and just the commonplace pictures one sees every year at the Royal Academy that would look perfectly appropriate upon the walls of some well-to-do citizen's surburban villa, but fall very short of the purpose they are supposed to fulfil from an architectural point of view.

Seemingly, even among well-known artists and architects, there are very few who appreciate the laws and limits which should confine the architectural decorator to a purely simple and direct means of making the most of the material to be used.

In South Kensington Museum are some twenty or thirty panels filled with mosaic copies of pictures prepared for the purpose by P.R.A.'s, R.A.'s, and A.R.A.'s, and not one of the mosaics shows that the artist who painted the original knew anything about the mosaic worker's art. They have just sat down and painted an oil painting and given it to a mosaic worker with instructions to copy it, and in every case the unmosaic-like design has been converted into a mosaic like an oil painting, every little brush mark has been faithfully reproduced, every minute painter's detail defined, and they have been placed (no doubt after very great expense) upon the walls of our great Art Museum. These bastard productions are neither oil-paintings nor mosaics.

There are other forms of bastard mosaics, those little monstrosities, mosaic jewellery (they have some at South Kensington), which the travelled public generally bring home from Venice. Mosaic is certainly not the proper medium for colouring jewellery. Cloisonne enamel is the most legitimate form of applying colour to gold and silversmith's work. A similar misapplication of mosaic is of very common occurrence among the Italian firms—they apply it to furniture and even to panels of doors, and, worse still, to picture frames and mirror frames. Surely inlays of wood or ivory are the only permissible forms of decoration—approaching mosaic—for such subordinate things as frames. But the Italians make the frames for pictures, themselves pictures, and worse still pictures in mosaic.

(*To be continued.*)

The Corner Stone of a New Theatre at Salford, to be called the Victoria Theatre, is to be laid by Sir Henry Irving on October 4th.

Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor.

A LAW CASE.

To the Editor of The Builders' Journal.

Sir,—Can you give us reference where we can find a report of the case *Dodd* v. *Churton?* It is a case bearing on the question of the time penalty and extras, under a building contract.—Yours, &c. C.

Dodd v. *Churton* is reported in the Law Reports (1897) 1 Q.B. 562, and 76 Law Times Reports 438, and 45 Weekly Reporter 490.

H. P. B.

ORDNANCE SURVEY MAPS.

To the Editor of The Builders' Journal.

Linlithgow.

Sir,—On the ordnance survey maps (of the largest scale) are fine dotted lines, running all over the paper, intercepted at every little bit by larger dots, and at greater distances by the sign ⊙. Could you inform me what these lines indicate?—Yours, &c., STUDENT.

We believe that the lines to which our correspondent refers are the contour lines showing the elevation. These, however, only appear on the 1in. and 6in. scales, and not on the larger, except in a very few instances. We cannot, however, be quite certain without seeing the lines in question, but there is a pamphlet published by the Ordnance Survey Department giving a description of the various characteristics, from which our correspondent could obtain all the information he needs. Its price is 6d.

DRAWING PAPER FOR PERSPECTIVES.

To the Editor of The Builders' Journal.

Linlithgow.

Sir,—I would be obliged if you could give me an answer, through the columns of your valuable paper, to the following question:—

I am desirous of making a perspective drawing and painting of a picturesque villa. I have tried several kinds of drawing paper, but they all curl up and warp when painted on. Could you recommend a kind, suitable for my purpose? STUDENT.

"Student" is unfortunate. We have used Whatman's paper for years, and many other kinds, none of which have given any trouble. Before "painting" is commenced, the paper should be strained; that is, moistened until it has expanded to its full size, and then the edges stuck down to a drawing board. When the paper dries it endeavours to contract, but, of course, cannot, and so remains stretched as tight as a drum. R. W. C.

PAYMENT FOR ARCHITECT'S SERVICES.

To the Editor of The Builders' Journal.

London, S.E.

Sir,—A friend of mine requested an architect to prepare plans, specification, and estimate for a house to cost about £600. The plans were prepared in pencil only, the specification made, quantities taken out, and three estimates procured, the lowest being £1390. This being so much more than my friend was inclined to spend, the work was abandoned. Will you kindly inform me, through your column of "Enquiries Answered," what the architect's charges should be?—Yours, &c., J. A.

So great an excess over the sum stipulated is *prima facie* evidence of negligence on the part of the architect to comply, or even to attempt to comply, with his client's wishes, in which case he can claim no payment whatever. If any claim at all can be substantiated, it would be for the full fees in accordance with the R.I.B.A. Schedule. G. A. T. M.

COVERING OF GRAVES IN CHURCH EXTENSION.

To the Editor of The Builders' Journal.

Barnsley.

Sir,—Will you kindly inform me whether there is an Act of Parliament or a law of any kind in existence regarding the covering of graves in a church extension? Is it necessary, after covering the site with concrete, to leave an air space between the concrete and the floor, and, if so, is there any minimum depth for such an air space? What is the usual method of carrying stone floors in such cases? If I am right in the idea that a law exists on this subject, I shall be pleased if you can give me the particulars of it and the best place to obtain a copy. Of course, a Faculty is granted for the work.—Yours truly,

G. W. S.

I am not aware of any law regarding the covering of graves in a church extension. The regulations as to burials will be found collected in Baker's Law Relating to Burials, 6th ed., Sweet and Maxwell, 3, Chancery-lane, 1898.—H. P. B.

INTERFERENCE OF CLIENT.

To the Editor of The Builders' Journal.

Sir,—Will you kindly inform me the proper course for an architect to pursue where his client unduly interferes with him and the contractor, and obtains the advice of an outsider for the purpose of raising vexatious and unreasonable objections to the work? Is he justified in throwing up the work, and, if so, what is the law as to fees in the case of the job being nearly completed? Would the architect be able to recover the full amount of his fees for superintending the work, after making some slight allowance owing to the work being not quite, though nearly completed, or would the fact of his electing to get out of the matter altogether prevent his suing for fees for superintendence? Also would he be justified in withholding the plans and specification from the client, when the latter applies for them for the purpose of consulting his adviser, who is evidently an amateur architect, or architectural handyman? VEXED.

If the interference is such as absolutely to prevent the architect from properly discharging his duties, he is entitled to refuse to continue to act, and to sue on a *quantum mesnit* for the value of the services rendered up to the time he withdraws, or for damages for breach of contract preventing him continuing and earning his remuneration; but if the interference is merely vexatious and annoying, however difficult it may be to bear with it, the architect should put up with it, and get the work carried out as best he can. If the client requires the work to be done in some manner different from what the architect has designed or specified, he should point out the injurious consequences likely to ensue, and throw the responsibility on him. If the client has paid for plans and specifications, they are his, and the architect cannot refuse to hand them over to him, no matter what may be the purpose the client intends to use them for. If they have not been paid for the architect may refuse to part with them for any purpose until they have been paid for. H. P. B.

BY-LAWS ON WALLS.

To the Editor of The Builders' Journal.

Colwyn Bay.

Sir,—I should be extremely grateful if you would kindly enlighten me on the following matters in the next issue of your valuable journal.

1. Can a local authority, who have adopted the Local Government Board's Model Bylaws for new Streets and Buildings (1875), insist under any clause in the by-laws, for internal brick partition walls, to be built of a greater thickness than 4½in.; seeing that section (19) provides for the minimum thickness of external or party walls only?

2. In a detached house, four storys high, is it legal under these bylaws to erect 4½in. brick partition walls from the level of ground floor up to height of topmost story?

3. What is meant by a cross wall under these bylaws?

4. Are a cross wall and a partition wall synonymous?—Yours, &c., IN THE DARK.

(1) A partition wall, if it be a "cross wall," and if it, as a return wall, determine the length of another wall, must be at least 9in. thick, and at least two-thirds of the thickness prescribed by the by-laws for an external or party wall of the same height and length, and belonging to the same class of building. Sect. 21.

(2) Not if they be cross walls which, as return walls, determine the length of other walls.

(3) A "cross wall" is one carried up to the top of the topmost story, when in each story the extent of the vertical faces or elevations of all the recesses and openings therein does not exceed one-half of the whole extent of the vertical face or elevation of the wall in that story. Sect. 18 (iii.).

(4) No. Some partition walls are cross walls, and some not.

Note.—The length of a wall is to be measured from the centre of one return wall to the centre of another, provided the return walls are party walls. External walls or *cross walls* of the thickness prescribed by the by-laws into the walls so deemed to be divided. Sect. 18 (iii.). H. P. B.

Correspondence.

STONE CHURCH, KENT.

To the Editor of The Builders' Journal.

Wolverhampton.

Sir,—In reply to the inquiry in your issue of Sept. 13th about Stone Church, Kent, there is a short description with a complete set of measured drawings of Stone Church, Kent, in Cavelar's "Gothic Architecture," part IV. (1835). W. J. R.

[Further information with regard to this church appeared in our correspondence columns last week. The illustrated article on Stone Church, which we have in hand, is held over until next week.—Ed.]

IS OUR PRESENT SYSTEM OF EXAMINATION A FAILURE?

To the Editor of The Builders' Journal.

London, S.W.

Dear Sir,—I was greatly interested by the letter under the above heading in your last week's issue, and agree with the author's remarks as far as they go. But apart from the examiner himself there are other matters which assist in showing the inadequacy of examinations in general as at present conducted. The most prominent of these is probably the amount of confidence possessed by the individual examinee.

Take, for example, two students sitting at the same time for the same examination. One may sit down calmly and put on his paper as much as he knows in answer to the questions, while the other may, owing to natural nervousness, be totally upset at the idea of an examination. The former may pass while the latter fails—not from lack of knowledge, for, in this respect, he might be by far the better of the two. This is, of course, far more noticeable where oral examination is adopted in place of, or to follow, a written paper.

It is impossible under such conditions to decide by the present system, which man or woman is the best suited to occupy any particular post, because although a person may dread an examination, it is no reason why he may not be thoroughly capable of performing his work in practice.

Again, the system at present in vogue is open to an unlimited amount of mere cramming in almost every case. The questions year after year are little more than repetitions, and a student who can work out from memory the last three or four papers which have been set will in all probability pass at the next examination. In many cases subjects are included which are totally foreign to the requirements of the examinee, and he has to waste his time in studying these, when he might be turning it to better account.

Trusting you will publish this in your valuable paper, and hoping other opinions may follow.—Yours faithfully,

PERCIVAL E. GLOYN.

Keystones.

A New Organ at the Royal Academy of Music.—A new three manual organ, by Messrs. Willis and Sons, has been placed in the concert room.

The First Monument to Brahms, in Germany, will be unveiled on October 7th at Meiningen. The monument is the work of Professor Hildebrand, of Berlin.

A New Hotel is to be erected at Padstow, to cost about £10,000, from designs by Mr. John Ennor, jun., of Newquay. The hotel will be called the South-Western Hotel.

The Foundation Stone of a New Church at Carlisle was recently laid by the Duchess of Devonshire. The church is to be built in Warwick Road, at a cost of about £8,000, from designs by Mr. C. J. Ferguson.

Proposed New Hospital for Leeds.—Dr. S. W. Wheaton, an inspector under the Local Government Board, conducted a public inquiry recently at the Leeds Town Hall, into the application of the City Council for sanction to a loan of £21,250 for the purchase of the Killingbeck Hall Estate as a site for a small-pox hospital.

The Eiffel Tower is undergoing a complete overhaul to prepare it for next year's exhibition. It is to be entirely painted with an enamel paint in five shades. The dome and summit are to be of a light yellow chrome, the shade graduating to the pedestal, which will be a rich dark orange colour. For the two coats which are to be put on the structure, nearly fifty tons of paint will be required.

A Terra-cotta Statue of the Queen has been erected by Messrs. Bulton and Co., Limited, in front of their works at Lambeth, opposite the Tate Gallery. It is about 12ft. high, and represents her Majesty, when she was some years younger, in full robes of State, and wearing the ribbon of the Order of the Garter. In the right hand she holds the emblem of sovereignty, and in the left a globe, the emblem of supremacy.

A New Primitive Methodist Church at Harrogate.—The memorial stones of a new Primitive Methodist Church were recently laid at Harrogate. The site of the church is in Bowes Road, and the building, which is in the decorated Gothic style, will have a tower and spire rising to a height of 100ft. Adjoining there will be a schoolroom, lecture hall, eight vestries, and a caretaker's house. The church will have accommodation for 550 worshippers. Mr. W. J. Morley, F.R.I.B.A., estimates the cost of the church, land, organ and other contingencies at £8,250.

New Candelabra in St. Paul's.—The candelabra in course of erection at St. Paul's Cathedral are now almost completed. One of these massive ornaments is the gift of Mr. Douglas Murray, in memory of his father, who was a prebendary of the cathedral; and the other has been given by the Decoration Committee. The candelabra are in bronze, and, mounted on a heavy slab of Irish fossil stone, rise to a height of nearly 15ft. Around the base in bold relief are three figures representing the white, yellow, and black races of mankind Figures of archangels support the stems for the lamps.

A New Gas.—The township of Hunmanby, a village between Scarborough and Bridlington, will in future be lighted with electroid gas, the new illuminant which it is claimed by the Scarborough District Lighting Company, Limited, will revolutionise the lighting of villages, urban districts, and country mansions. Electroid gas is acetylene with the admixture of inert matter and a proportion of oxygen. Its manufacture is simple, and the gas can be delivered through any ordinary gas main pipes at the ordinary pressure. It can be measured by means of gas meters and charged for in the same way as is the custom where ordinary coal gas is used. It is a light of great purity and brilliancy. The Scarborough District Lighting Company propose to light a considerable number of villages throughout Yorkshire with the new gas.

A New Organ at Copgrove Church.—The quaint old church of Copgrove has recently been restored, and a new organ, made by Messrs. Abbott and Smith, of Leeds, has been presented by Captain Bridgeman.

New Church at Sefton Park, Liverpool.—A new Episcopal Protestant Church was recently opened in Smithdown Road. The building, which is of corrugated iron and has accommodation for over 1000 persons, has been erected by the late Mr. J. A. Bramley-Moore, of Aigburth.

St. George's Church, Birmingham, has been renovated at a cost of £1,300. The chancel and nave have been cleaned and decorated, new seats have been introduced, a new hot-water system of heating has been adopted, and the exterior stonework of the west end has been restored.

A Furnishing Entertainment.—A smoking concert was held last Saturday week at the "Prince of Wales," Kensington, by the Drawing and Prime Cost office staff and foremen from Waring and Gillow's Hammersmith factory. Mr. A. E. Millington was in the chair. A very enjoyable evening was spent.

A New Granite Quarry is to be opened at Ty Mawr, Pistyll, Carnarvon, by a Liverpool syndicate, who have acquired about fifty acres of property in this district. This property includes a dock, from which the stone can be cheaply shipped. Both red and blue granite are obtainable, and the quality is said to be excellent.

The Yorkshire Foresters' Orphanage and Convalescent Home at Bridlington was opened recently by J. T. Firbank, Esq., M.P. for East Hull, in the presence of a large concourse of members of friendly societies. The building has been erected by Messrs. F. Blackburn and Son, of Hull, and the architect is Mr. Robert J. Beale, A.R.I.B.A., of London, whose design was selected in open competition.

Sir John Brunner, M.P., has made to the borough of Bulach, in the Canton of Zurich, in Switzerland, a gift of £5,000 for the purpose of building a small hospital, which will bear the name of the Brunner family, whose members were burgesses of Bulach since the early part of the fifteenth century. Sir John Brunner has also presented the new Swiss National Museum at Zurich with £1,000 to be devoted to the purchase of one or more ancient works of art for the treasure room of the museum.

The Liver Sketching Club at Liverpool intend to hold the usual Winter Exhibition at their rooms in Dale Street, commencing on Monday, November 27th. The private view will be held on the Saturday immediately preceding. Last year's exhibition was by far the most successful the club has ever held, and it is confidently expected that the coming one will not fall below the standard then established. The hanging committee will be composed of the following members:—Messrs. C. O'Neill, J. H. Tyson, S. J. Hertford, and R. Wane.

Historic Properties.—Recently, quite a number of historic properties have changed hands, or are about to do so. There is Chepstow Castle, which belongs to the Duke of Beaufort and is one of the five Norman castles built during the reign of William the Conquerer. Then there is Timber Court, Thames Ditton, formerly a favourite resort of King Charles. Another, Acton Castle, near Marazion, Cornwall, is to be transformed into a big hotel. It was built by a wealthy crank called John Stackhouse about 1775 for the express purpose of studying seaweed.

Restoration of a Cornish Well-Chapel.—The re-dedication of the restored Well-Chapel of St. Clether, was performed last week. The chapel, which had long been in ruins, was situated in a bog, and last year, when the castle was cleared away, suddenly the water resumed its old course and flowed by a subterranean channel under the east wall, bubbled up beneath the altar, and then was carried away by a second subterranean conduit into the second holy well. The chapel has been completely restored. Almost all the old stones were found.

Munificent Gift to a London Hospital.—The Governors of the London Hospital have received £60,000 from the executors of the late Baroness de Stern towards the establishment of a convalescent home.

The Arts and Crafts Exhibition will be open for two months from October 9th. The south room of the New Gallery will be devoted entirely to specimens illustrating the work of the society's late president, Mr. William Morris.

The Cromwell Statue at Westminster will be unveiled on October 31st. A committee is being formed to make preparations for a national demonstration on the same evening. Lord Rosebery has consented to speak on this occasion.

Accident at Dover Harbour Works.—On Wednesday a man named Edward Albert Knowles had charge of some blasting operations at a considerable height on the cliffs. It is stated that he gave the order to fire the explosive before he was clear, and when the explosion took place he was blown down the cliff and killed.

A Disastrous Fire at a Sheffield Engineering Works, belonging to Walker and Eaton, adjoining the Great Central Railway, occurred on Saturday, September 16th. The outbreak originated in the pattern works, and spread so rapidly that before the fire brigade arrived a large block was in flames. The total destruction of the works was prevented, but damage was caused to the extent of about £10,000.

A Fatal Accident occurred on September 18th at the excavation works in the Mile End Road in connection with the Whitechapel and Bow Railway. A staging of planks supported by heavy timber trestles, which was used for carts to back up to for loading and unloading purposes, suddenly collapsed, and Michael Flynn, a labourer, who was underneath at the time, was crushed by the falling timber. Death was instantaneous.

Improvements at Scarborough.—It is proposed to construct a new reservoir on Spring Hill, with a capacity of 3,000,000 gallons, for the supply of Falsgrave. The estimated cost is £8,500. New footpaths are to be laid out in St. Nicholas Gardens at a cost of £964, trees and shrubs are to be planted in various parts of the borough, the castle, dykes, and holms are to be improved, and it is proposed to construct a tramway down to the North Cliff near the pier.

The Comparative Breaking Strength of Concrete Slabs made with, and others made without, the addition of expanded metal was tested before a large number of gentlemen at the Gallowgate Ironworks, Newcastle-on-Tyne, on Monday, last week. The experiments were continued on the following day, and a sub-committee, which was appointed by a joint meeting of several representative local bodies, is drawing up a report showing the relative breaking strain of the two kinds of concrete.

A New Central Park at Ilford, which has just been opened, comprises forty-seven acres, and has a large lake in addition to the usual flower beds and shrubberies. The £12,000 which has been borrowed from the Local Government Board for the acquisition of the park was lent for the longest possible period—fifty years, so that the rates will be increased by only a very small amount. Councillor Griggs, Chairman of the Parks Committee has presented a drinking fountain to the Council.

The Excavations at Thermos, the ancient place of assembly of the Ætolians, are being carried out under the superintendence of M. Sotiriades, who reports that he has discovered an edifice decorated with painted metopes, on which are inscriptions pointing to figures of the Graces and of the goddess Iris. These are in terra cotta, and resemble the antique statuettes found in Sicily. There is also a fountain, with important inscriptions bearing on the history of Ætolia. Lastly, M. Sotiriades has discovered traces of an ancient city near Thermos, the walls of which were three mètres in extent, and are well preserved.

WITH GREEK BUILDERS.

By JOHN A. MARSHALL.

(Continued from page 84, No. CCXL.)

IV.—THE ERECTHEION.

"Mighty, indeed, are these figures! these limbs, how gracefully rounded!"—Goethe.

After the formal severity of the Propylæa, the student may not be unwilling to turn his attention to the effeminate beauties of the Erectheion—some twenty years younger than the Periclean epoch.

Much of the original work from this building is in the British Museum, including an inscription relating to the construction, and describing some of the very stones to be seen in the Museum. Another inscription, containing the building accounts, has also been found, and though both inscriptions are fragmentary, yet, thanks to numerous learned commentators, a great deal has been made clear, and another phase of the architectural practice of the Greeks has been opened out for us.

The student is no doubt familiar with the plan of the building, and respecting the purpose of its singular disposition it will suffice to regard the edifice as the shrine of several ancient cults, for which distinct apartments had to be provided or incorporated.

The site is bounded on the south and east by a terrace, 10ft. in height, which once served as the basement of an ancient temple. The walls of the Erectheion are carried up from the rock of the lower level, but the floor and entrance of the eastern apartment were on the level of the terrace, and this portion of the building was probably entirely shut off from the rest, but there is nothing to show what the division walls were like.

The north portico, on the low level, is of unusual proportions; it was utilised as a sanctuary, and by the side of the main entrance is a small doorway, which led into an open court.

The south wall of the main building, at its western end, is kept a few feet clear of the stylobate of the ancient temple, and advantage is taken of the gap thus left to insert a small staircase leading down from the terrace to the western compartment, and thence through a small doorway in the west wall to the open court before mentioned. It was, perhaps, to the necessity of inclosing this staircase that we owe that gem of Grecian art, the Caryatid porch which is bridged over the gap, and transforms what would otherwise have been an uninteresting stretch of plain walling into a charming composition.

At the north-east angle the difference in the levels of the ground was met by a wide flight of steps.

Taken as a whole, the arrangement of the building may be described as picturesque, while breadth and mass were ensured by the unbroken continuity of the main roof.

The spaces between the columns on the west wall were originally left open, excepting for a height of 4ft. 6in. above the bases. At this level a recess or niche is formed in the south wall just inside the building, and this recess—it has been conjectured—contained some object intended to be seen from the court.

The filling in and the windows, existing in the last century, were Roman alterations, although, from the condition of the anta at the northern end of the west wall, it has been thought probable that the filling in of this particular intercolumniation was part of the original design. Mr. Schultz has suggested, with some probability, that alterations were made to the building in late Greek times—say, the second century B.C.—especially to the large north doorway.

In the year 409 B.C., when the building was nearing completion, it was decreed by the people that the epistatæ, appointed to superintend the erection, should draw up a report enumerating the works which remained to be done. It is this report which is in the British Museum. The other inscription referred to above contains some of the building accounts rendered by the epistatæ to the treasurers of Athene, B.C. 408 or 407, when probably the building was completed, or nearly so. From these accounts we learn that the workmen engaged were of two classes, day labourers and those on piecework. The former included stone sawyers, carpenters, labourers, and the men who put up and took down the scaffolding. All these were paid at the rate of a drachma a day (9½d.). Of the latter class are mentioned the sculptors of the frieze and those engaged in fluting the columns.

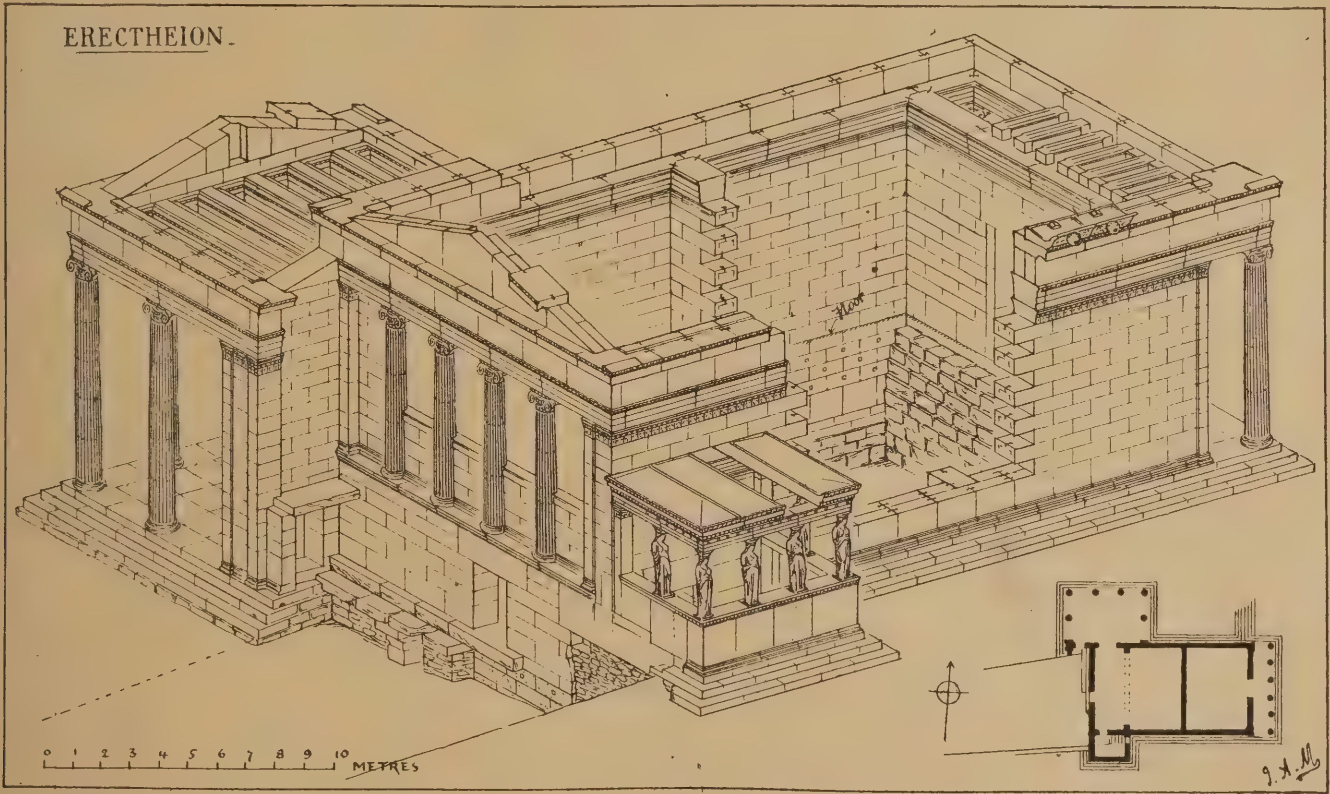
It is evident from these accounts that at this time there was no general contractor, the epistatæ dealing directly with the workman, but we cannot say whether this had been the arrangement from the commencement of the works, or only towards the close. The accounts for one prytany only (thirty-five days) are practically complete, the rest being fragmentary, so that the length of time covered cannot be determined, but it is probable, from the nature of the items, that these payments were only for work executed after the report furnished by the epistatæ in 409 B.C.

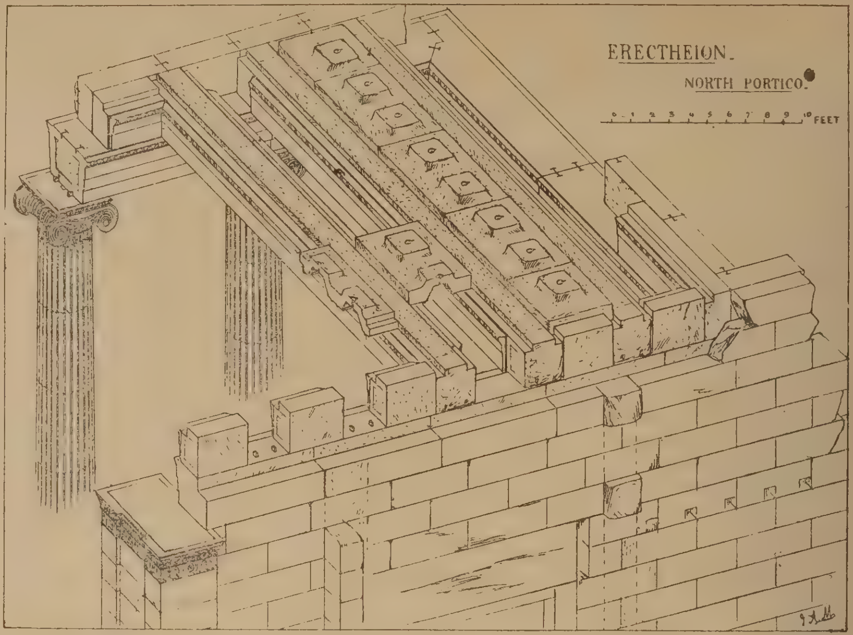
This report gives the size and condition of every stone that was being worked, or that was not placed in position; it also specifies the fluting, carving, and polishing that remained to be done.

Although the list of items is incomplete, it is clear that, at the time of the survey, the building was well advanced; the north and south porticoes were nearly finished, and some of the stones of the frieze were in position. This height was not, however, attained all round, for at the south-west angle, over the Caryatid porch, the work seems to have been kept down a few feet.

It is here the report begins, with a list of No. 5 plain walling blocks, "not placed" (see Fig. 1, p. 121). One of these was a corner stone, with part of the anta worked on (Fig. 2). The ordinary walling blocks are stated to be 4ft. long, 2ft. wide, and 1ft. 6in. high. These agree with the actual dimensions. There are also No. 5 stones 4ft. long, 3ft. wide, and 1ft. 6in. high, for the enriched course under the architrave (Fig. 3); also a corner stone of this course, with cap of anta worked on (Fig. 4). These stones passed through the wall and were moulded on both sides. In the Museum may be seen the sliced-off fronts of four stones, including a corner stone, apparently from the north-east angle of the north wall (Fig. 5). Then follow No. 5 epistylia, or architrave blocks, 8ft. long, 2ft. 3in. wide, and 2ft. high, "not placed" (Fig. 6). The architraves passed through the wall, and were enriched with a cymatium on both sides; the inner cymatium was not carved, and was worked in places on a separate stone, let into a rebate, and clamped to the architrave. Thus one item runs: "The cymatium of the 8ft. length of architrave on the inside of south wall has to be added." The sliced-off front of an architrave is in the Museum.

The following items are described as "not polished," or "smoothed off":—No. 3 epistylia, the south wall, the orthostatæ all round the building, the three steps forming the base or stylobate, and the upper surface of the roof stones of the caryatid porch.





The following are stated to be "not fluted":—The columns of the north and east porticoes, the upper torus of the base mould all round the building, and on the bases of the columns (Fig. 7).

The carving had to be done to the necking of a column on the west wall (Fig. 8), and to the architrave of the Caryatid porch. The rosettes on this architrave are still in block.

A peculiarity in the arrangement of the orthostatæ—due to the difference in the levels—may be noted here. In the western apartment, the orthostata of the north wall is repeated at the same level on the south side, although concealed on the exterior by the terrace; and on the same side, but 10ft. higher, is another deep band, the stones of which appear outside, but pass only halfway through the wall, so that they could be backed with stones made to range with the ordinary walling blocks inside (Fig. 10).

The moulded base stones under the orthostatæ, outside, are worked in two ways: for the north wall the upper fluted torus is worked on the base stones with the rest of the mouldings, but on the south side it is worked on the orthostata (Figs 9 and 10).

The "finishing-off" which remained to be done to the top of the Caryatid porch probably included the "weathering" of the stones, and the forming of raised rims or rolls along the joints to throw off the water, which eventually passed through the pierced cymatium of the cornice. This roof is formed of four stones, each 12ft. by 5ft., let into the wall at the back, and resting on the architrave in front, which is supported on the well-known architectonic figures; on the underside the stones are deeply coffered.

The construction in relation to this porch has been a never-ending source of discussion for archæologists. On the west, both the porch and the angle of the main building are supported on a huge lintel, 14ft. 9in. long, 4ft. 9in. high, and 2ft. thick, so as to be quite independent of the ground at the south-west angle of the court, as though some other building or shrine once occupied this position, and had to be maintained during the erection of the present building. Another singularity is that the porch is merely placed against the main building, not bonded to it, with the exception of the roof stones; these stones, however, do not bond accurately with the walling blocks, and, on the west, the profile of the cornice projects beyond the main building and is cut off square. The pilasters are monoliths, placed against the wall. On the west side of the porch—where the base moulding stops—there are indications of a parapet wall, which protected the terrace on the south from the open court below. The court was also inclosed by a wall on the north. A drain from the south-west corner of the court discharged through the steps of the north portico, just outside the wall; this drain may have carried off the water which found its way into the Caryatid porch, or, possibly, through the openings of the west wall, but these latter were, perhaps, filled in with trellis work.

Just inside the west wall, under the floor, a cistern—supposed to be coeval with the building—is hollowed out of the rock, but it is impossible to say with certainty how it was supplied.

We will now return to the "accounts." At the time of the survey the fluting had not been done to the columns of the north and east porticoes, nor to the upper torus of the moulded bases; this was evidently reserved, like the carving, as a "finishing off" process. From the building accounts we learn that, in fluting the columns, each column was assigned to a gang of five, six, or seven men, working under an overseer. The gangs were paid at the termination of each prytany, or every thirty-five days, and according to the number of drums completed, which seems to have generally been two. The pay per gang during a prytany differed but little. This may be accounted for by assuming that any fraction of a drum which might be worked, in addition to the two completed ones, was not paid for at the same time. For fluting two drums during one prytany, the gang of six men received 192 drachmæ, and the total cost of fluting one column has been calculated to amount to 400 drachmæ. The amount of the pay to each gang would, probably, also be affected by the length and diameter of the sections or drums, and by the termination of the flutings at the top and bottom of the column. The column from the east portico (in the Museum) is 20ft. in height, excluding cap and base; it is built up in four sections, diminishing in diameter from 2ft. 3in. at the bottom to 1ft. 11in. at the top. The columns of the north portico are 22ft. in height, in not less than five sections, 2ft. 9in. in diameter at the bottom, and 2ft. 3in. at the top.

Respecting the fluting on the torus of the base of Ionic columns, it is evident that, although this was not generally finished until near the completion of the building, yet when the torus was large and worked on a separate stone—as in the archaic type—it was necessary to finish two or three flutes at the bottom before the stone was placed, as they are so deeply undercut that it would be impossible to work them *in situ*. In the Museum there is an unfinished torus from the archaic temple at Ephesus which is quite plain, with the exception of two flutes on the under side. The fragment of a base from the Mausoleum has two flutes unworked in the middle of the torus, but the inscribed lines for the fillets can be clearly traced on the unfinished part.

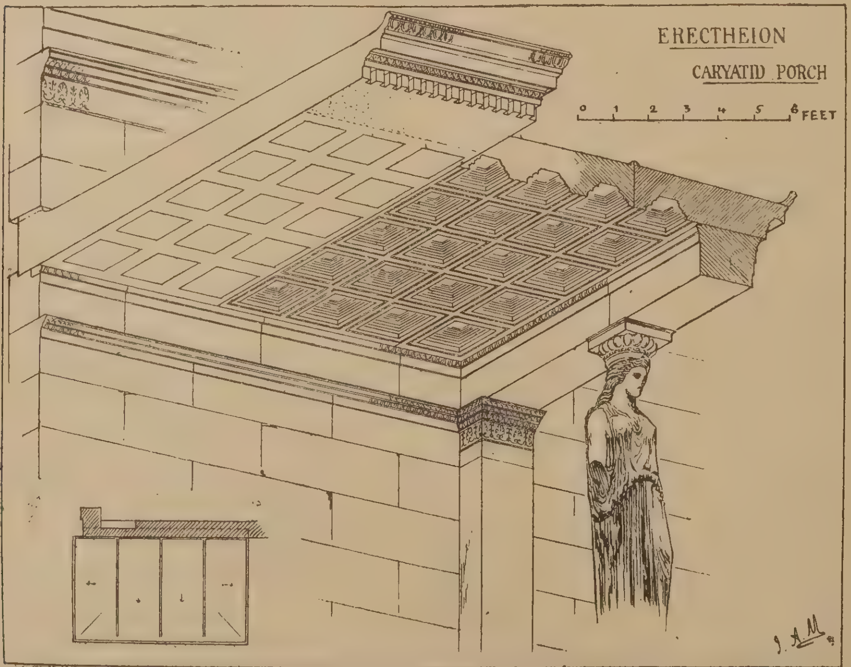
The frieze all round the Erectheion, and the tympana of the east and west pediments were in two thicknesses, the outer facing being of dark limestone from Eleusis.

This served as a background for the sculpture in white marble, which was clamped to it. The figures were worked in separate pieces, without a background, and flat at the back, for fixing against the slabs. They were about 2ft. in height, and a few fragments have been identified. In the accounts there are several sums paid to the sculptors, the prices for single figures ranging from 120 drachmæ to half that amount. A group of three figures cost 240 drachmæ. There is also an item: For the purchase of lead for fixing the figures of the frieze, 10 drachmæ; and, for the purchase of gold (two leaves) for gilding the eyes of a column, 2 drachmæ.

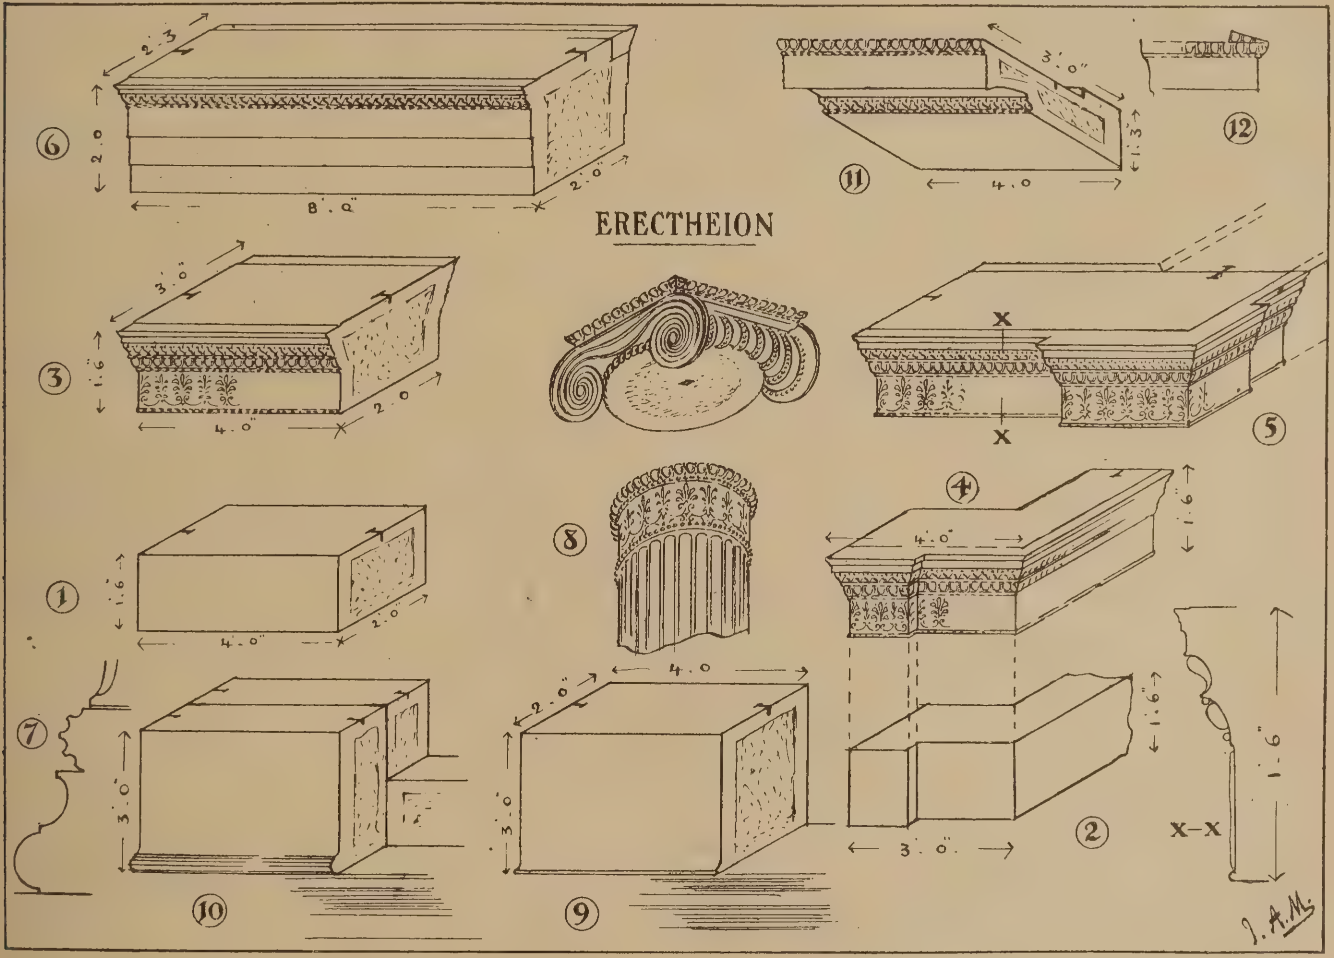
The carpenters were also very busy putting together the roofs and ceilings.

Having now arrived at the level of the frieze, we will continue our examination of the building with the help of the "report."

Several stones 2ft. wide, 1ft. thick, and from 4ft. to 6ft. in length, are given, of each of which it is stated that "the alternate joint is not worked, nor the back joint." The heading



of this list is missing—the inscription being broken at this part—but it has been held that the items refer either to the backing stones of the frieze or to the stones of the eaves gutter. The width and thickness are exactly suited to the frieze, and the difference of length is what we should expect for backing stones which were not seen. Another reason for associating these stones with the frieze is, that they immediately precede a list of stones for the corona, or cornice. According to Böckh, the alternate joint was at one end of each stone, where the sinking for the metal clamp was left to be worked *in situ*, to ensure accurate adjustment, while the back joint had to be notched for the ends of the ceiling beams, which probably rested on the architrave course. Others have thought that these joints refer respectively to the raised rims on the sides and back of the stones forming the eaves gutter, and that they were left for adjustment *in situ*. We are not aware if any of the gutter stones for this building have been found, although there is, we believe, an anthemion, from a cover tile, in the Museum.



The list of stones for the corona surmounting the frieze and the tympana of the east and west pediments, appears to be complete; but it will suffice to give one or two of the items as examples:—

"No. 7. stones of the corona (for the eaves), 4ft. long, 3ft. wide, and 1ft. 3in. thick, blocked out smooth, but not carved."

"Of two others, not carved, of the cymatium 4ft., and of the astragalus 8ft." One of these stones is in the Museum (Fig 11), and it will be seen that it is enriched with an upper and a lower cymatium, each associated with an astragalus: it follows therefore that a stone 4ft. long would have a total run of 8ft. of cymatium and 8ft. of astragalus. "Two corner stones for the east portico, 6ft. long, 3ft. 6in. wide, and 1ft. 3in. thick; of these, one was finished off smooth, but the whole of the cymatium and astragalus was unworked."

"The stones of the (horizontal) corona for the east and west pediments, 4ft. 6in. long, 2ft. 6in. wide, and 1ft. thick, one of these worked smooth and another with the smooth work half finished."

The corona stones for the eaves were 1ft. 3in. thick, but notched or rebated in front for the gutter stones.

The horizontal cornice under the pediments was, however, only 1ft. thick; but the angle stones for same were 1ft. 3in. thick, because they comprised a small portion of the inclined cornice (Fig. 12). The pediment of the north portico was completed at the time of the survey, and it may be noted that its tympanum had no facing of dark Eleusinian stone, but consisted of three solid blocks of marble 2ft. thick; the centre piece—7ft. long—was notched for the ridge of the roof; the side stones were each 10ft. long.

Some backing stones for the east and west pediments are stated in the report to be only half worked; in fact, they had not apparently been cut to the raking lines of the tympanum, as they are all one height, viz., 3ft. 6in., and 1ft. thick.

The roof timbers of the north portico were, it is stated, "not placed."

We have now gone through the more important items, and must conclude our description from the remains of the building itself. None of the stones mentioned in the inscription seem to belong to the ceilings of the north and east porticoes, and these were probably finished; although, of course, it is impossible to say what was contained in the missing portion of the inscription.

The ceiling of the north portico comes next in importance to that of the Propylæa. The beams, which have a bearing of 19ft., are about 2ft. square, and are arranged over the columns and over the centre of each intercolumination. This agreement with the divisions of the peristyle was almost necessary in Ionic buildings, where the ceiling beams rest either immediately on the architrave, or are notched on to it. Being so closely associated, any disparity in the spacing out of the columns and the ceiling beams would be unpleasant.

The beams are about 3ft. apart, and the top edges are rebated for the lacunaria stones, with a sub-sinking along the top of the moulding to relieve the latter of the weight. As usual, the mouldings and facia are mitred at the ends for the return blocks on the walls. The lacunaria stones are deeply coffered, and to reduce the weight, the top is roughly cut away around each coffer. At the joints the stones are rebated to overlap; thus each stone had a bearing on three sides, which reduced the risk of falling in case of fracture.

An astragalus around the coffers concealed the transverse joints on the soffit, and the panel of each coffer was enriched with a bronze patera, secured by a bolt, which passed through the stone and was keyed at the top. A lacunaria stone from this portico is in the Museum, but, unfortunately, the upper surface is embedded in the wall against which it is placed.

A fragment, supposed to belong to the ceiling of the east portico, is in a wall case in the same room; the coffer, which is pierced through the stone, was covered by a separate slab, probably to facilitate the carving of the egg and tongue enrichment around the opening. For the north and south porticoes the coffers and panels were worked out of the same stone, but the mouldings were not carved, only decorated in colour.

(To be continued.)

Erratum.—In the last article of this series the word "gutter" in the middle of the first column of page 83 should read "guttæ."

Huddersfield's New Drill Hall.—The whole of the tenders for the erection of this hall have been secured by Huddersfield firms. The estimated cost of the building, including new streets, heating apparatus, furnishing, &c., is about £7,500.

Bricks and Mortar.

APHORISM FOR THE WEEK.

"But when I heare our Architects mouthing those big and ratling words of Pilasters, Architraves, Cornixes, Frontispieces, Corinthian and Dorike works, and such-like fustian-terms of theirs, I cannot let my wandering imagination from a sodaine apprehension of Apollodonius his pallace, and I find by effect that they are the seely and decayed peeces of my kitchen-doore."—MONTAIGNE.

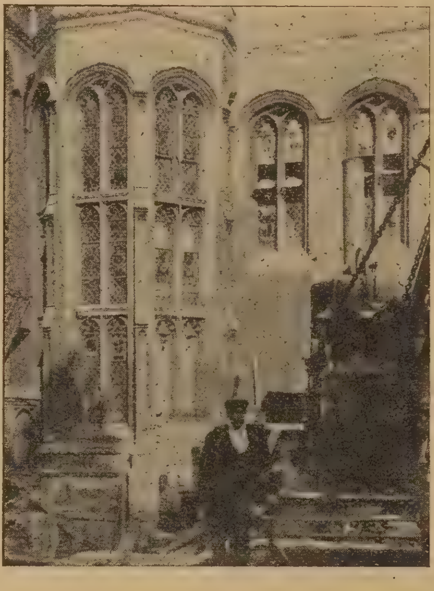
A Pair of Semi-Detached Houses THE plans and elevations, illustrated in one of our supplement plates this week, of the pair of semi-detached houses at Whitton Park, Middlesex, speak for themselves; but it may be added that the materials consist of red facing bricks wherever brickwork is exposed, but with the exception of the buttresses, bases to bays, and plinth to back lean-to buildings, the entire walls are built with stocks and covered with white rough cast. The outside timbering where shown will be tarred black with gas tar. The whole of the windows are glazed in leaded lights. The architect is Mr. J. W. Cobb, of 121, Blenheim Crescent, Notting Hill, London, W. The estate upon which these houses are to be erected is a very beautiful one, its natural advantages being perhaps almost unique in a building estate so near London, being only fourteen miles from Waterloo. One feature of the estate, especially, may be mentioned. The old mansion, with lake and about 30 acres of beautifully-timbered land, is proposed to be left intact and used as a club and recreation ground.

Accident to a Steeplejack. ON September 16th an inquest was held on the body of Martin Gallagher, a Liverpool steeplejack, who was killed at the Hardshaw Brook Chemical Works on the previous Thursday. Thomas Massey, another steeplejack, said that the chimney was originally 140ft. high, but by the day in question he and deceased had got half of it down. They should have started work at six o'clock on that day, but Gallagher said he did not feel fit for climbing, and went back again. They arranged to start work at one o'clock. Gallagher was then quite sober, and nothing, apparently, was the matter with him. He first climbed the chimney by means of a ladder, and then, sitting across the top of the chimney, handed the top ladder to witness, who was outside the chimney on the ascending ladder. Witness lashed the ladder again, and shortly afterwards a boy at the bottom shouted, "Martin has gone." Witness knew what that meant, and went down. He found Gallagher lying at the bottom of the inside of the chimney. Some loose bricks in the flue were removed, and Gallagher was pulled out. He was unconscious, and was afterwards removed to a hospital, where he died. Witness could not say how Gallagher fell from the top of the chimney, unless he in some way missed his footing. He was a practical man, and well understood the business.—A verdict of "Accidental death" was returned.

Mutilating Monuments. THE life of a prominent man is hardly ever free from some fierce attacks, but it certainly does seem hard that his monument should not be allowed to remain in peace. Some persons at Hughenden, however, think otherwise, for they have just been further mutilating the monument erected, in a somewhat lonely spot near Tinker's Wood, to Mr. Isaac Disraeli, father of Lord Beaconsfield. This time knives have been used. On a former occasion the monument was described at the Hughenden Parish Council as a target for mischievous stone-throwers. Unless some attempt is made to prevent further mischief being done, we are afraid that the monument will, one day, be entirely demolished.

The French Embassy in London. ALTERATIONS to the French Embassy, Albert Gate, W., are now in progress, and will effect a considerable enlargement to what is already the most imposing Embassy in London. Some houses are being demolished on the eastern side, where the Church of the Holy Trinity stands—a church which is often a source of curiosity on account of its having a public-house on each side. The two huge buildings which flank Albert Gate are more notable, as regards the exterior, for their bulk than for their beauty. Like many another palatial mansion in London, their grandeur is solely within. Built in 1846, they were popularly known as "the two Gibraltars," because it was thought that they "could never be taken." However, although "Gib" has hitherto remained impregnable, these immense buildings were not so long in finding tenants. That which has long been the French Embassy was first occupied by Hudson, ex-draper and railway millionaire. When the railway king's financial crash came the French Government took the house over.

Crosby Hall. THE demolition of some buildings in Bishopsgate Street, E.C., has exposed to view the part of Crosby Hall shown in our illustration. It is a good specimen of Perpendicular Architecture, and was built in 1466 by Sir John Crosby, alderman and M.P. for London. This historic hall is one of the few examples of domestic Architecture of its day which have survived the ravages of "improvement," and the disastrous fires which have periodically laid waste our ancient City. It was occupied by Richard of Gloucester, afterwards Richard III., and is the place where he planned the deposition and death of his nephew, and where Lady Anne awaited his return from Henry VI.'s funeral, as described in Shakespeare's "Richard III." It is also said that Sir Thomas More wrote his "Life of Richard III." when residing under this roof. Crosby Palace was subsequently owned by Sir John Spencer, the wealthy Lord Mayor of London, whose daughter, married to the Earl of Northampton, was one of the greatest heiresses in the kingdom, living here in luxurious style. The Countess of Pembroke, "Sidney's sister," spent part of her life within these walls. The palace subsequently became a Presbyterian conventicle. From that it sank in the social scale to a warehouse, and has finally been converted into a restaurant, much in favour among City men.



CROSBY HALL, A HITHERTO CONCEALED PORTION.

A New Town. IN the Russian journal "Rossia" some particulars are given about the new town of Dalny, near Port Arthur, which the Russians intend to build. It will take the place of the small native villages which now partly surround the bay of Talienwan, some twenty miles from Port Arthur. Each of these villages consists of a dirty narrow street of badly built stone houses with straw roofs, in which the Russian troops are at present quartered. Among the larger buildings are two Buddhist temples, one of which is used as a military hospital, and the other as a place of meeting for the soldiers. Commanding the bay, but now in ruins, are the fortifications constructed by the Prussian colonel, von Hanncke. They consist of four forts. Talienwan is connected with Port Arthur by telephone and telegraph, and the post runs twice a week. The bay makes a satisfactory harbour, but the question arises whether it will not be necessary here, as at Port Arthur, to deepen the harbour on account of the large draught of some of the vessels. When Dalny is built Port Arthur will continue to be the administrative centre, but in commercial and industrial affairs Dalny will take the leading part. The majority of the wretched Chinese houses which stand on the site of the new town were abandoned by the inhabitants at the time of the Japanese occupation.

Luxuries in Water. THERE are some people who use too much water and some who use too little, and some who use it in an unauthorised manner. Three of the latter appeared at the Waltham Cross Petty Sessions on September 19th. Mr. Arthur Gill and the solicitor for the East London Waterworks Company attended to prosecute.—Mr. Gill stated that Section 72 of the Company's Act excluded water being used for gardens, fountains, or ornamental purposes of any kind when only the ordinary rate was paid, and should water be required for any other purpose it should be obtained by meter. That was a matter concerning which no person had a right to be ignorant, as on each demand note was a notice calling attention to the matter.—John Wallace, of Chingford, pleaded guilty to using water for non-domestic purposes.—Mr. Gill said that a fountain was attached to a fishpond on defendant's premises, through which the water came in considerable quantity by means of a sprinkler.—Defendant said there was only a small sprinkler attached to the fountain. The chairman remarked that this was a deliberate taking of the water, and in entire contravention of the conditions. Defendant would be fined 20s. and costs.

Glasgow Arcitectural Association. AT the opening meeting of the twenty-second session of this Association, held in the rooms, 187, Pitt Street, on the 19th inst., the President, Mr. John Fairweather, A.R.I.B.A., delivered his opening address on the Association and its work. Briefly reviewing the many changes which had taken place in the twenty-one years of its history, the President, while acknowledging the vast increase in the membership, had to complain of a proportionate decrease of interest taken in the Association by its members, draughtsmen, craftsmen, and juniors, particularly the latter, the very class for whose benefit the Association was originally instituted. He enumerated the various benefits to be derived from the Association, both architectural and social, and pointed out that if each member would come forward, join hands with the committee, and do his utmost as an individual to further the aims of the Association, there was no limit to the influence which it might effect as an educative body. At the conclusion of his address Mr. Fairweather was accorded a hearty vote of thanks.

Queen Elizabeth's Hunting Lodge. THE building known as Queen Elizabeth's Hunting Lodge, at Chingford, which for the past four years has been the home of the Epping Forest Museum, is now being restored by the Corporation of London, so as to provide increased accommodation for the Essex Field Club's exhibits. These will be thoroughly reorganised in the course of next year, when the collection will become a supplemental one to the new museum at Stratford, which is now being erected at a cost of about £9,000, in close proximity to the municipal technical buildings and library. Here will be placed the Essex Museum of Natural History of the Essex Field Club, and in all probability a collection of art objects lent by the City Corporation. On the ground floor is a large central hall, lighted from above, which will make an excellent room for the display of scientific and other objects.

The Panama Canal. THE Panama Canal is being continued by some American speculators. When some years ago the Panama scandals were divulged at the time of the trial of de Lesseps and some of his colleagues, everyone was talking of this gigantic engineering enterprise which had ended in a gigantic failure. But great as are the difficulties of cutting through an isthmus some thirty-five miles wide, and forming a navigable canal, owing to the local conditions, the canal might perhaps have been an accomplished fact ere this, says the "Morning Herald" had there not been gross carelessness, wastefulness, and fraud in the spending of the shareholders' money. In the end, when the old company went into liquidation, £74,000,000 had been expended, and only one-fifth of the work had been done. With the new Panama Canal Company came a system of economy and most careful supervision, and the results are very encouraging. Every appliance used in great excavations has been tested, and the results have been carefully recorded. The canal entrance from the Atlantic is from the Bay of Limon. The island of Manzanillo, the terminus of the Panama Railroad, known as Aspinwall, is on the left and east.

Some Points in Construction. INSIDE the breakwater, at the upper end of the island, is a vast basin, not yet completed, where wharves and dry docks are to be built. The first real obstacle was encountered near Colon, where much submarine mining was required; but this once passed the dredgers made their way to Gatun. It is here that the Chagres River is encountered for the first time as the canal enters the river. At the Obispo Valley the Chagres bends to the left, and it was at this point that a really serious difficulty was encountered. Where the canal line enters the valley of the Obispo, the Chagres becomes a powerful river, subject to sudden and dangerous increase in volume, and striking the canal at nearly a right angle. As the excavation demanded was nearly 80ft., a tremendous dam was projected to control the waters of the Chagres at Gamboa—a dam of such unheard of proportions that no two engineers could agree as to its details, as at that time a safe foundation had not been discovered. In order to gain time for further investigation, it was determined to adopt a system of locks, ten in number, all of which were in an advanced state at the time of the disaster, but have been since definitely abandoned in favour of the project of M. Godlin de Lepinay, who proposed to convert the interior of the isthmus into a vast artificial lake. This is now regarded as the key to the problem, and on this solution is based the definite project of the New Panama Canal Company, placing the bottom level of the canal at 68ft. above sea-level. It seems now not only possible, but probable, that in not so very many years the Panama Canal will be available for navigation. Enormous advantages to the whole commercial world will then be obtained.

A Hidden Picture. A CURIOUS picture has been discovered on the walls of the Suffolk Arms, at Winchester, a house till recently known as the "Marquis of Granby," under which name it has been licensed for about a century. It appears that the landlord was having one of the bedrooms repapered when he found under four layers of "hanging" an oil painting of a humorous character, which he has decided to leave uncovered for the inspection of visitors. The painting is 2½ft. by 3½ft., with a frame consisting of foliage with roses and the Prince of Wales's plumes, and the subject is a group of four seated figures all in the costumes of the reign of George II. or George III. They are represented as sitting in quaint chairs, smoking churchwardens, and for each there is a glass containing what is supposed to represent ale. On the table there is also a large pot, on which can be traced the word "King," and this, it is surmised, is the end of a loyal phrase. One of the figures is evidently that of a soldier, in a red coat, and with a wooden leg; another is a sailor, with a pigtail and blue dress; and the two others are believed to be a lawyer and a doctor. On the wall are also representations of two horses, ridden by jockeys.

Archæological Discoveries at Chester. THE excavations being carried on for the reconstruction of the Grotto Inn, at the end of Commonhall Street, Chester, have yielded further discoveries of considerable importance and interest, undoubtedly dating back to Roman times. In addition to the base of the Roman column already discovered, another has been unearthed of precisely the same construction. Both are *in sitû* upon the original wall, and on the south side of them there is still intact the water or rain gutter, while the masonry adjoining is quite perfect. It is highly probable that these two columns joined to others discovered in Commonhall Street, and thus can be traced out the north and south sides of what had been originally a large and imposing building. In clearing off the *débris* a quantity of charcoal and portions of charred timber were discovered with other remains, such as coins of Constantinus I. and II., fragments of bronzes, roofing tiles, and portions of a pair of millstones. It is inferred from the abundance of charcoal that the buildings were probably destroyed by fire.

Art Craftsmen. AN interesting little exhibition of examples of work done by members of the Guild of Art Craftsmen was held at 31, Cantilowes Road, Camden Square, London, N.W., on Monday and Tuesday, last week. The existence of this guild is not so well known as it might be, but, although its members are few at present, it is sure to push its way to the front of the Art world. The guild claims that its existence needs no apology, since, notwithstanding the growing demand for artistic objects of applied art, no really serious attempt has been previously made to place before the public specimens of modern work designed and executed by the co-operative action of a guild. The members of the guild are all craftsmen engaged in the production of art metal work, silver ware jewellery, carved ivory, furniture, enamelling, house decorations, &c. Three of its members have exhibited objects of applied Art at the Royal Academy. The work of these three gentlemen, whose names are Onslow Whiting, R. Garbe, and G. M. Ellwood, was very much in evidence at the exhibition. Another of the members is Benjamin Nelson, whose skill in glass painting and enamelling has called forth the praise of Sir William Richmond and others.

The Exhibition. THE works exhibited were simply examples of the members' ability as art craftsmen. In some cases the works had been executed to the order of patrons, while in others they were produced as specimens of handiwork, and were for sale. The object of the exhibition, the guild's first, was to interest those who desire to see the revival of the artist craftsmen. The members of the guild modestly admit that they by no means regard themselves as having attained the limit of artistic excellence, but, being young, they confidently expect that their work will go on steadily improving. One of the most striking exhibits was a handsome oak cabinet, about 7ft. high, the work of Mr. G. M. Ellwood. Its principal characteristic was the inlaid work in the hinges, which were of steel, and had been cut out in a neat design. Underneath the hinges were seen plates of copper, which were let into the oak, and to which the hinges were fastened. The cabinet itself was of simple but somewhat heavy appearance. Another excellent piece of work was an oak chimneypiece, designed by the same gentleman The panel of this was of silver, and on it was worked a design by Onslow Whiting, the subject of which was the Road to the Tourney. There were also two smaller panels, showing the fight and the victor. There were various other small exhibits of painted glass, enamelled glass, carved ivory, needlework, statuettes, and plasterwork, all of which were well executed.

A Famous Dutch Artist. A LINK with the past has been broken by the death of the Dutch painter, David Bles, who was the doyen of his profession in Holland. He saw the new school of Art arise, and, during the later years of his life, he remained almost the last representative of the old. Dutch Art in the first years of this century was living on the reputation of its earlier schools. The spirit had fled from it, and the great ambition of each painter was to reproduce or rival the finish, or microscopic minuteness of Netscher and his followers. David Bles rescued it from this hopeless state of decline. He made Teniers his model; he took a little inspiration from our own Wilkie; he revived genre, and flavoured it, as the old Dutch masters so well knew how to do, with humour. The new school, the school of Maris and Mauve and Mesdag and De Hass, was just coming on. Bles had a great vogue, and knew how to keep it. The Italian Government selected him as the artist whose portrait should represent modern Dutch Art in the Cosmopolitan collection of painters' portraits at the Uffizzi, and paid similar honours to Leighton, Millais, and Watts. His last important work was the portrait of the young Queen of Holland, at the time of her coronation.

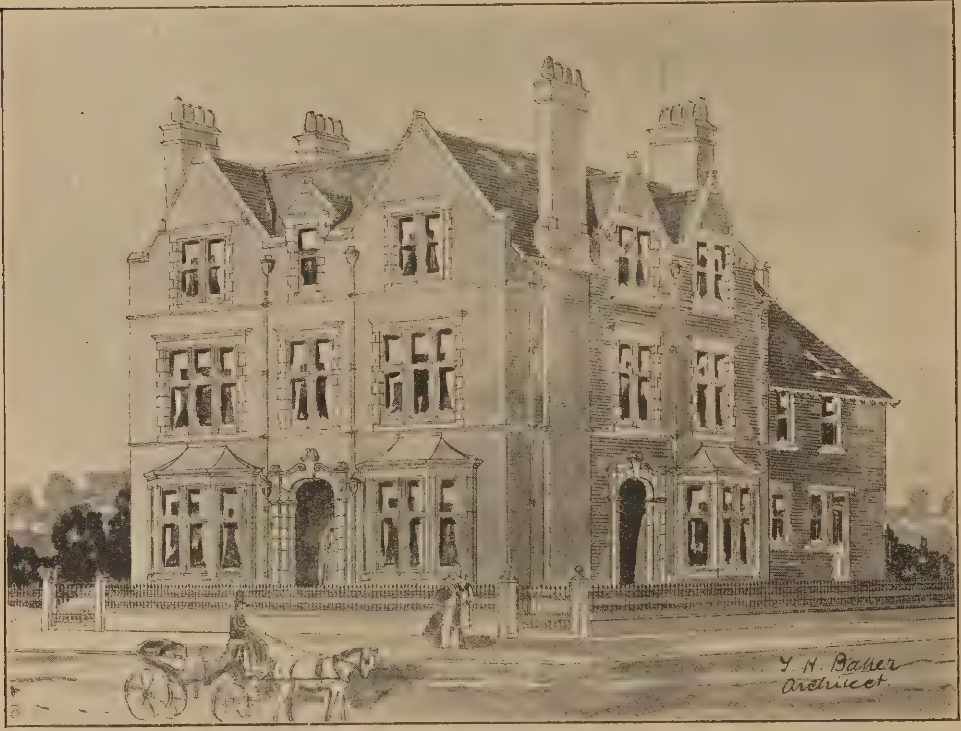
Interesting Discovery at Penn. A FACULTY applied for by the Vicar (Rev. B. J. S. Kerby) and churchwardens of the parish of Penn, Buckinghamshire, for the removal of an old high-backed pew in the historic church was granted, and the pew has just been taken down. The floor upon which it stood was found to be a false one, resting on the original one, which was dangerously perished. The decayed material having been cleared away, the coffin of William Penn, who was buried there in 1638, was discovered lying within 4in. of the surface. It was of oak, black with age, and perfectly sound. The floor having been carefully covered and sealed, was relaid and cemented round The interest of this discovery wants some further elucidation. The William Penn who occurs to everybody's mind on hearing the mention of the name lies in the Quaker's burial ground at Jordan, and the year of his death was 1718. Admiral Sir William Penn did not die till 1670, and he lies in St. Mary Redcliffe's, Bristol.

Another New London Thoroughfare. NEGOTIATIONS are now being made by the London County Council for the purchase of about twenty houses that will have to come down to enable them to form the new thoroughfare that is to run from the Borough High Street, through the churchyard of St. George the Martyr, to a point in Long Lane, Bermondsey, a little below Tabard Street. Directly the property is acquired, which may be in about a month's time, the work will be commenced. This is estimated to cost £194,000. It appears from the plans that the new road will sweep away three large shops to the left of the church, and form an open thoroughfare 60ft. wide through the churchyard, isolating the church from that part of it that abuts on the side of the old Marshalsea prison, and clearing away all the houses, and perhaps part of the courts, on the left side of Long Lane down to a place of business popularly known as "Harding's." In return for the part of the churchyard and recreation ground that is swept away, the L.C.C. will give a piece of ground of equal dimensions close by.

Professional Practice.

Bristol.—The dedication service of a new chapel at St. Anne's Park was held on Wednesday. The new building, for the present, will be used as a chapel and also as a Sunday-school, but eventually for the latter purpose only. It comprises the school chapel, measuring 40ft. by 28ft., with seating accommodation for about 250 persons, and in the rear of this a vestry, with kitchen and lavatory accommodation. The style is perpendicular Gothic. The walls are built of red pennant with freestone dressings. The large room has an open boarded roof and pitch pine dado. The floors are of pitch pine blocks, and the windows are glazed with leaded lights. The work has been carried out by Mr E. C. Norris, and the architects are Messrs. La Trobe and Weston.

Clacton-on-Sea.—The two houses here illustrated are to be built in the Marine Parade, West Clacton, on Round's Estate, facing the sea. The materials proposed to be used are local red bricks, red Broseley tiles, and Ancaster stone. The lowest tender was £2,440. Mr. T. H. Baker, of Colchester and Clacton-on-Sea, is the architect.



HOUSES AT CLACTON-ON-SEA. T. H. BAKER, ARCHITECT.

Ebbw Vale.—Sir William Harcourt opened the new county schools on Wednesday. The schools have been erected at a cost of about £2,600, and are arranged on the dual principle. The accommodation provides for sixty boys and forty girls. There are four class rooms, two of which are convertible, by means of folding partitions, into one large assembly room. Provision is also made for music and art room, cookery, laundry, and scullery, chemical laboratory and workshop, and, in addition, hat and cloak rooms for boys and girls respectively, and rooms for masters and mistress. Simplicity of plan has been aimed at, with the least possible length of corridors. There are separate entrances for boys and girls, and the cookery, laboratory, &c., form separate wings to each department. The building is of Ebbw Vale buff brick, with bands of red and dressings of Bath stone. Internally the joinery is of stained Oregon pine, the corridors, cloak rooms, and laundry are of granolithic, concrete, and the floors generally of wood blocks. The contractors were Messrs. Lawson and Co., Newport, and the joint architects were Mr. J. H. Phillips, of Cardiff, and Mr. F. Baldwin, of Brecon.

Knowle.—Board Schools have recently been commenced from designs by Mr. H. Dare Bryan, and include a large mixed school, providing accommodation for 500 children, an infants' school, seating 250 children, and, in the basement, a large cookery school, bonnet room, scullery, &c., for girls, and a manual instruction workshop for boys. Provision is made for an extension of class-room accommodation for 200 additional scholars. In the mixed school there will be a central hall 80ft. by 35ft., which, in addition to educational purposes, may be used for public meetings. Messrs. Keen and Keen are the contractors for the work.

Lozells.—The memorial stone of a new mission hall in Berner's Street, Lozells, was laid on September 16th, by Miss M. A. Wheeler, of Ealing, London, who gave the freehold of the land on which the building is being erected. When completed, the hall will be two storeys high. The ground floor will be divided into class and reading rooms, suitable for use as a young men's club, while the mission room proper will be above, and will be capable of accommodating about 450 persons. At one end there is to be a large platform or chancel, but in order that the room may also be used for social purposes, this portion will be made to screen off. The actual cost of building, which is being carried out by Messrs. Harley and Sons, Smethwick, from the designs of Mr. Daniel Arkell, will be £2,184, but the cost of furniture and other items, will bring the total up to £2,734.

Richmond.—The new Theatre Royal and Opera House was opened for performances last Monday week. Mr. Frank Matcham is the architect. The new theatre stands immediately opposite an open space known as the Little Green, to which it presents a highly ornamental front of red brick and terra-cotta. On both sides the building is surmounted by a turret, each of which has been utilised for ventilating purposes. The entrances to all parts of the house (with the exception of the gallery) are in front, a balcony, accessible to boxes, stalls, and dress circle, extending along the entire front. The main staircase, facing the entrance, is of marble. A special feature is that each corridor leading from the street has double doors, thus insuring the audience immunity from draughts. The total seating accommodation is for 1,227 persons. The decorations of the auditorium are in the Elizabethan style. The entire building, before and behind the curtain, is lighted by electricity. The design of the ceiling, which stands out in fine relief, has four subject panels representing scenes from "Hamlet," "A Midsummer Night's Dream," "King Lear," and "Romeo and Juliet." The proscenium opening is of marble, having on either side a draped column springing directly from an oak-panelled base, which forms the sides of the stalls. The act drop represents a view of Richmond Bridge. The stage can be entirely separated from the auditorium. The width of the proscenium opening is 27ft., and the stage measures 34ft. from back to front, 52ft. across the full width, and 50ft. in height to the grid, above which there is room for men to work. Beneath the stage are rooms for supers and the members of the orchestra. For the performers themselves there are eight dressing-rooms, of varying size, on three floors at the back of the stage.

Sheffield.—An important addition to St. Vincent's Church, Solley Street, that has been in progress since the close of last year has just been opened. The addition, consisting of a roomy aisle, completes the plan of the building as originally projected at the time of its erection in 1856. The church was planned with a spacious nave 110ft. long, and 30ft. wide, with an apsidal termination, and a southern aisle. The base of a massive tower was carried to the height of the church a few years later, and in 1890 a chapel of the Sacred Heart was erected in the southern aisle. The new aisle is 100ft. in length, and 22ft. in width. In arched recesses in the outer wall are placed the Confessionals. Over the recesses there are large three-light windows with marble arcaded shafts in the interior. At the end of the aisle is a transept, against the east wall of which near to the entrance to the new sacristies is to be placed an altar in honour of St. Joseph. An organ chamber has also been constructed at the eastern end of the south aisle, and an entrance porch and doorway with carriage access from Solly Street complete the new aisle. The building is designed in a lancet style of architecture to harmonise with the original edifice. The new aisle, including the re-heating of the entire church, St. Joseph's altar, and some minor alterations, will cost £3,000. The architects of the new work are Mr. C. Hadfield and Mr. C. M. Hadfield; and the builders are Messrs. O'Neil and Son.

Sledmere.—The Queen Eleanor cross which Sir Tatton Sykes, Bart., has caused to be erected at Sledmere, at the junction of the York and Malton roads, is nearly completed. Its height is about 55ft., and it is built of Portland stone. From the ground to the cresting of the first stage it is octagon in plan, and from thence all is square, excepting the second stage, which has a niche projecting from each face, so forming a cross in plan. Starting from the base is a plinth with a fine flight of eight steps. At each corner is a buttress, terminating in a pinnacle, both being freely ornamented, and between the buttresses are moulded panels with gablets enclosing shields bearing the arms of England, Castile, &c. The second stage has on each face a figure over 6ft. high, standing under a fine canopy. The canopies are very elaborately carved and ornamented. The third stage is solid, the faces being filled with panels with tracery heads, and gables with crockets and finials; while the topmost stage has on each face, between mullions, female figures with crowns on their heads, in attitudes of prayer and adoration. The figures were executed in the studios of Mr. Thompson, at Peterborough, who is also the builder of the cross, from designs by Mr. Temple Moore, of Hampstead.

New Companies.

William Townson and Sons, Limited.

This company was registered on September 18th, by C. H. Hodges, 12, New-court, W.C., with a capital of £15,000 in £5 shares, to adopt an agreement for the acquisition of the business of joiners and builders, carried on by W. Townson, at Bolton, Lancashire, and to develop and extend the same; also as timber growers and merchants, sawmill proprietors, &c.

Preston and District Brick and Tile Company, Limited.

This company was registered on September 12th, by Pitman and Sons, 14, Clements-lane, E.C., with a capital of £10,000 in £1 shares, to carry on in the township of Cottan, near Preston, the business of brick and tile manufacturers, to adopt an agreement with W. Harrison, and to build and maintain workshops and other premises. The first directors (to number not less than three nor more than seven) are to be appointed by the subscribers. Qualification, 100 shares.

John Board and Co., Limited.

This company was registered on September 13th, by Waterlow Brothers and Layton, Limited, Birchin Lane, E.C., with a capital of £60,000, in £1 shares, to acquire and take over as a going concern the businesses now carried on at Dunball, in the county of Somersetshire, and elsewhere, under the styles or firms of John Board and Co. and the Dunwear Brick and Tile Company, and all or any of the assets and liabilities of the proprietors of the business in connection therewith, and with a view thereto to adopt and carry into effect an agreement expressed to be made between W. S. Akerman of the first part, C. W. M. Greenhill of the second part, W. Brice and E. L. H. Reed of the third part, and this company of the fourth part, and, generally, to carry on business as dealers in or agents for the sale of cement, lime, brickyard goods, scouring bricks, building materials, and other articles of a like nature; as warehousemen, carriers, barge owners, steamship owners, shipowners, wharfingers, and builders; to acquire and turn to account any shops, warehouses, tenements, plant, machinery, stock-in-trade, horses, carts, or other property necessary or expedient for carrying on the company's business. The first directors (of whom there shall be not less than three nor more than five) are W. S. Akerman, C. W. M. Greenhill, and K. A. Akerman. Qualification, £5,000. Remuneration: W. S. Akerman, £300 per annum; C. W. M. Greenhill, £150; of others to be fixed by the company.

R. W. Blackwell and Co., Limited.

This company was registered on August 29th, by Messrs. Sutton and Co., 3 and 4, Great Winchester Street, E.C., with a capital of £200,000 in £1 shares. To carry on in all or any of their respective branches the businesses of electrical engineers and electricians, as producers and suppliers of electricity for the purposes of light, heat, or power, or otherwise as manufacturers of and dealers in all plant, machinery, and apparatus for the generation, distribution, supply, and accumulation of the same; to lay out and maintain all necessary cables, wires, lines, lands, and works in connection therewith; to construct and maintain any rail or tram roads, whether worked by electricity or otherwise, also omnibuses and other vehicles; builders of rolling stock, engines, trolleys, and machinery of every description, tramcars, carriages, trucks, and locomotives; boilermakers, mechanical engineers, machinists, fitters, metal workers, wire drawers, tube makers, smiths, builders and contractors, or any other business capable of being carried on in connection with the aforesaid businesses or any of them; to construct and maintain docks, piers, wharves, warehouses, irrigation works, reclamation, improvement, sewage, and drainage works; to acquire, deal with, work and turn to account in such manner as the company shall see fit any decrees, concessions, lands, buildings, works, &c. The signatories (each one share) are Messrs. A. J. F. Barker, P. Dawson, F. H. Baker, C. Dickenson, A. H. Barker, B. N. Howell, and R. Brown. The first directors (of whom there shall be not less than three nor more than five) are to be elected by the signatories. Qualification, £1,000. Remuneration, £200 per annum each.

Brightside Foundry and Engineering Company, Limited.

This company was registered on September 18th by Pilgrim and Co., 17, Coleman Street, with a capital of £90,000 in £1 shares. The purchasing of the undertaking and business of the Brightside Foundry Company, Limited, the business carried on under the firm of Walter Eaton and Co., and the undertaking and business of J. C. and J. S. Ellis, Limited, all in the city of Sheffield, and the goodwill thereof, and the works and premises whereon the same are respectively carried on, and certain hereditaments adjoining or near to the said works, and the plant, tools, stock-in-trade, contracts, and other rights and privileges belonging to or connected with the said respective businesses; and with a view to the above objects, or any of them, to adopt and carry into effect an agreement expressed to be made between the Brightside Foundry Company, Limited, J. C. and J. S. Ellis, Limited, and others and this company; and, generally, to carry on business as manufacturers of and dealers in all plant, machinery, and apparatus for the generation, distribution, supply, and accumulation of the same: to construct and maintain any rail or tram roads: as builders of rolling stock, engines, trolleys, and machinery of every description, &c., boilermakers, mechanical engineers, builders and contractors, or any other business capable of being carried on in connection with the aforesaid businesses or any of them: to construct and maintain docks, piers, wharves, &c.: to acquire and turn to account any decrees, concessions, lands, buildings, works, &c. The first directors (of whom there shall be not less than four nor more than seven) are A. Firth, G. Shaw, B. Freeborough, T. Wilkinson, and T. H. Firth. Qualification, £1,000. Remuneration to be fixed by the company.

Pinchin, Johnson and Co., Limited.

This company was registered on September 18th, by Gush and Co., 3, Finsbury Circus, with a capital of £60,000 in 4,000 preference shares of £5 each and 40,000 ordinary shares of £1 each, to acquire as a going concern the business of oil refiners, colour, paint, and varnish manufacturers, and wholesale drysalters as now and hitherto carried on at Broad Street, Ratcliff, Middlesex, under the style of Pinchin, Johnson and Co., together with all or some of the assets and liabilities of the said business and the goodwill thereof, and to carry on in such places in the United Kingdom and elsewhere as may from time to time be determined all or any of the trades or businesses in all their various branches of white lead and zinc manufacturers and merchants, colour makers, levigators, and grinders, paint manufacturers, varnish makers, oil boilers and refiners, glass, lead, oil, paint, varnish, and colour merchants, importers, manufacturers, and exporters, drysalters, sheet-lead rollers, lead-pipe drawers, and shot manufacturers, sanitary ware manufacturers, brush manufacturers, timber merchants, wood sawyers and turners, and general wood workers, seed crushers, and tallow chandlers; as dealers in all kinds of plant, machinery, apparatus, tools, utensils, products, substances, materials, merchandise, articles, and things necessary or suitable for the carrying on of the above trades or any of them; as bankers, financiers, capitalists, and general merchants; to acquire and turn to account any real or personal property, patents, patent rights, and inventions; to erect or construct and maintain wharves, factories, buildings, warehouses, works, machinery, and plant for the purposes of the company's business. The signatories are: A. C. Hill, T. Rosenberg, E. Rosenberg, C. E. Dowling, D. J. Wood, L. Weeple, and A. H. Franch, each with one share. The first directors (of whom there shall be not less than three nor more than five) are to be elected by the signatories. Qualification, £500. Remuneration to be fixed by the company.

Trade and Craft.

GRATES, STOVES, AND VENTILATORS.

Messrs. E. H. Shorland and Brother, the well-known Manchester firm of warming and ventilating engineers, whose works are in Drake Street, Stretford Road, have sent us their recently-issued catalogue. This comprehensive work runs to nearly 100 pages, is printed on three different colours of paper, and is strongly bound. The firm call particular attention to their new patent projecting Manchester grate, the firebox of which is lined entirely with fire tiles, the back portion being made to project well over the fire. This increases the radiating and smoke-consuming powers of the grate, besides increasing its warm air generating properties. The patent grate back can be used in any grate which has a projecting canopy, but for grates with flat canopies it does not project so far. The grates look very handsome in conjunction with the richly-glazed faience chimneypieces supplied by the firm. Another of the firm's specialities is the patent exhaust roof ventilator. This is made of the best rolled steel, galvanised, and painted with enamel paint. It is constructed to give the largest amount of outlet possible for the vitiated air. It is perfectly weatherproof and without down draught, and can be easily fixed on the roof, only requiring a wood box covered with lead or zinc, over which the base of the ventilator is placed and secured by screws. The patent Manchester stoves are made with either ascending or descending smoke flues, and with either one or two fires. They are largely used in hospitals and other public buildings. The catalogue contains a large number of new designs of the patent exhaust roof ventilators, inlet tubes, and inlet panels.

INTERTALK TELEPHONE SYSTEM.

One of the latest improvements on intercommunication by telephone is an instrument which has been patented by Mr J. D. F. Andrews, of the firm of Messrs J. D. F. Andrews and Co., Ltd., Fulham Electric Works, Putney Bridge Station, Fulham, S.W. This instrument has been devised for a common return and for metallic circuits, so that overhearing by induction is entirely avoided. The communication is effected by the simple pressure of a push, which calls the distant instrument while pressed and connects for speaking after removing the finger. By pressing two or more of these buttons simultaneously, a corresponding number of persons may be put in conversation with each other, a matter of great convenience in many instances. By replacing the telephone on the hook, disconnection is automatically effected and the pushes replaced ready for a future call. The objects referred to are obtained by a very simple, and, to all appearance, reliable construction of instrument. There is an oscillating bar connected with the home receiver and transmitter arranged as a common catch for the springs of all line pushes and when one of these is depressed to its limit, it comes against a contact connected with the home battery, and thus effects a call on the bell at the distant instrument. When the finger is removed, the push catches on to the oscillating bar and makes connection with the speaking instruments. It will be obvious from this brief description how easy it is to effect connection with several people at the same time. The construction of the instrument admits of easy access for examination or adjustment, the whole of the parts being mounted on one base contained in the case of the instrument, which can be easily removed.

New Patents.

The following abridged description is specially drawn for The Builders' Journal and Architectural Record *by Messrs. Hughes and Young, Patent Agents, 55 and 56, Chancery Lane, London, W.C., who will give advice and assistance free to our readers on all Patent matters.*

10,328. Roofs.—Patentee: F. W. Golby, of Chancery Lane, Middlesex (Bellinghen-Tomberg, F. van; Brussels). The slates are secured to the battens by bent metal spring clips.

10,359. Hinges for Doors, Windows, &c.—Patentee: G. Goller, Jean Paul Stre, Bayreuth, and H. Goller, Lerchenfeld, both in Bavaria, Germany. The pin and socket portions are each cast with a screw and a screw hole for an extra screw, the socket portion being attached to the door. A templet is used in boring the screw holes in the door and frame to insure correct attachment.

10,387. Guards for Wood Planing Machines.—Patentee: F. Love, 24, Stanley Street, Groves, Yorkshire. Consists of an arched or curved plate which is placed over the cutters of a wood-planing or moulding machine with vertical cutter spindle. This arched plate is fixed to the bench by a bracket, the upper end of which is fixed to the plate adjustably by means of a screw and slot. Notches are cut in the sides of the plate to admit the wood. A curved plate is fixed over the end of the arch by a slotted bracket. The guard may be applied to any machine of like construction to the above wood-planing machine.

10,401. Windows.—Patentee: H. B. Ives, 529, State Street, New Haven, Connecticut, U.S.A. The sash is prevented from rattling by pressing it against the guide rail by means of the bead which is adjustably secured to the casing. The bead is provided with a hole into which a projecting portion is driven. The bottom is somewhat thicker than the sides, and has a slot for the passage of the securing screw. The bottom of the part may be corrugated so as to firmly engage the head of the screw when driven home. The necessary adjustment is obtained by loosening the screw and moving the bead, and the part relatively to it.

CONTRACTS OPEN.

GREAT WESTERN and METROPOLITAN RAILWAYS.

The Joint Committee are prepared to receive TENDERS for the CONSTRUCTION of a new STATION at "Notting Hill and Ladbroke Grove."

Plans and specification may be seen, and forms of Tender and bills of quantities obtained, at the office of the ENGINEER at this Station, between the hours of TEN a.m. and FOUR p.m.

Tenders, addressed to the undersigned, and marked outside "Tender for new Station at Notting Hill," will be received on or before TUESDAY, the 3rd proximo.

The Directors do not bind themselves to accept the lowest or any Tender.

J. MAHON,
Secretary to the Hammersmith and City
Railway Joint Committee.

Paddington Station,
London,
September, 1899.

HACKNEY VESTRY.
TO BUILDERS.

The Hackney Vestry invite TENDERS for ALTERATIONS to and EXTENSION of the HACKNEY PUBLIC BATHS, Lower Clapton-road, N.E.

Plans and specification can be seen at the Offices of the Architects, Messrs. GORDON LOWTHER and GUNTON, Finsbury House, Blomfield-street, E.C.

Quantities can be obtained on application to the Architects upon payment of a deposit of £1 1s., which will be returned to persons sending in a bonâ-fide Tender with the priced bills of quantities.

Tenders, sealed and endorsed "Tender for Alterations and Extension of the Hackney Public Baths," must be delivered at the Town Hall, Hackney, not later than FOUR o'clock on WEDNESDAY, OCTOBER 11th, 1899.

The proposed contract will contain a clause providing that, in the case of all workmen employed by the contractor, he will be required to pay wages at rates not less, and to observe hours of labour not greater, than the rates and hours set out in the Vestry's schedule in force at the date of his Tender, and that penalties will be enforced for each and every breach of this clause.

The Vestry do not bind themselves to accept the lowest or any Tender.

GEO. GROCOTT,
Vestry Clerk.
Town Hall,
Hackney,
September 19th, 1899.

THE PROBLEM SOLVED!

ORDINARY WOOD RENDERED FIRE-RESISTING THROUGHOUT WITHOUT AFFECTING ITS UTILITY AS A BUILDING MATERIAL.

The London Non-Flammable Wood Co. Ltd.

who have recently introduced into Europe the process now being so largely used in America, have erected large works in this country, and are now taking Orders for the supply of their

NON-FLAMMABLE WOOD.

The whole of the Carpentry and Joinery in the following notable buildings in New York, amongst others, consists of NON-FLAMMABLE WOOD:—

THE COMMERCIAL CABLE BUILDING,
THE QUEEN'S INSURANCE BUILDING,
. . and . .
THE R. G. DUNN BUILDING.

NON-FLAMMABLE WOOD has been tested by H.M. Admiralty, and large Orders have been given by H.M. Government.

Quotations on receipt of Requirements, Address, &c.

CONSTRUCTING A DRUM-CURB FOR WELL SINKING.

By G. ELLIS.

WELL shafts are sunk in various ways, according to the distance from the surface of the water to be tapped. Deep wells—that is, those more than about 40ft. deep—are now invariably formed by driving down iron tubes or cylinders of small diameter into borings made by drilling machines. These are usually termed artesian wells, although, strictly speaking, an artesian well is one from which the water flows, or rather overflows, without the aid of pumping.

Shallow wells of small diameter are sometimes formed by lowering short cast-iron cylinders into the excavation, one above the other, and bolting the flanges together, then sinking them as the excavation proceeds by means of screw jacks or by simply loading the top with stones, &c. Wells of larger diameter are formed by the drum-curb process in the following manner:—

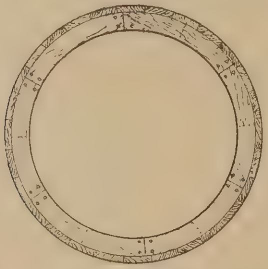

FIG. 1. PLAN OF DRUM-CURB FOR WELL-SHAFT.

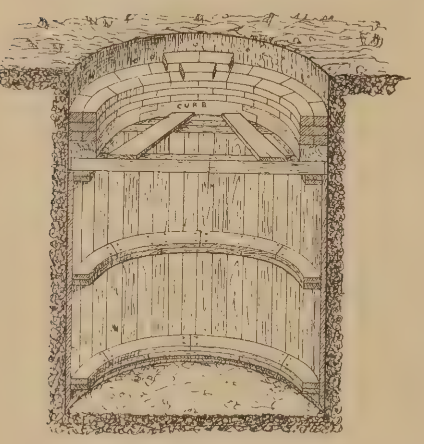

FIG. 2. SECTIONAL ELEVATION OF A DRUM-CURB.

A cylinder about 6ft. long and of an external diameter equal to the shaft to be sunk is constructed of 1in. elm boards, from 3in. to 6in. wide, nailed to the outside of three ribs; each of the latter is built up in two layers of 1¼in. elm plank, 4in. to 5in. wide when cut to the sweep. The layers are screwed together with the end of one segment lying in the middle of the one above it, as shown in the plan (Fig. 1). The bottom ends of the boards are bevelled on the inside to form a cutting edge, which, if the curb is intended to pass through stoney soil, is protected by a rim or shoe of sheet iron nailed on the outside and turned up for 1in. inside. The outside of the drum is planed smooth, or, in tenacious ground, can with advantage be covered with sheets of zinc nailed right round in horizontal strips, with the vertical joint butted. First the top sheet should be fixed, then the next below, and so on, the edges being overlapped an inch, and the edge of the lowest being covered by the iron shoe to prevent the zinc being ripped off by stones, &c.

When the drum is prepared, an excavation is made of about half its depth, into which it is lowered. A platform is then arranged on the top, and loaded with bricks. The excavators inside proceed with the digging, and as the core is removed by means of shears and tackle through an opening in the platform, the drum gradually sinks until it is flush with the ground. The platform, &c., is then removed and replaced by a thick elm curb, cut to the size of the brickwork, and lap-jointed and spiked together. Upon this, as a base, the bricklayers build the lining, or steining, in one, two, or three half-brick rings, in cement, and with as few headers as possible (see Fig. 2). The outside of the steining is kept regular to prevent, as far as possible, any rupture of the courses by friction with the sides of the shaft, and, as the excavation proceeds, the brickwork is continued above ground as high as practicable, its weight causing the whole to sink until water is reached. Sometimes the pressure on the sides becomes so great that no amount of weighting will make the drum descend. In such a case a fresh drum must be prepared, small enough to pass through the first, which is then filled in with brickwork between the ribs. The excavation then goes on inside the second drum, as in the first instance.

Smaller wells are sunk by the underpinning method, described in the article on foundations in Nos. 238, and 240, pp. xxvi. and xlii., of THE BUILDERS' JOURNAL.

SANITARY INSTITUTE.

THE ANNUAL CONGRESS.

(*Concluded from page lii., No. CCXLI.*)

PROFESSOR PERCY FRANKLAND, in opening Section III., said that England was well to the fore in practical sanitation, but was behind in sanitary science. He contrasted the amount of money expended on national defence and on hygienic education, and said that the progress of science was quite as important for commercial reasons as was national defence. He referred at length to the Bluebooks on sanitary science, which dealt with the substitution of water gas for coal gas, the use of lead in potteries and of phosphorus in matches, and said he was in favour of the recommendations of the committee. In regard to phosphorus, it was the obvious duty of everyone to abandon such matches. He next dealt with the application of bacteriology to sanitary science, and with regard to the bacteriological analysis of water he pointed out that the old idea that the bacteriologist was going to determine whether the condition of water was likely to cause disease or not was completely exploded, the real value of the bacteriological examination of water lying in the assistance which it rendered in controlling and checking the filtration and purification of water. There was no new principle in the bacteriological treatment of sewage, for it had been going on on the same lines for years without being recognized. Sewage purification was a fermenting industry, just as brewing was, but with this distinction—that, whereas brewing was one of the most remunerative of industries, there was no hope of sewage purification being carried on at a profit. Mr. W. D. Scott-Moncrieff, in the discussion which followed, said that the disappointment arising from the failure of sewage farms as sources of profit was now fully recognised and accounted for, but the solution of the sewage problem on purely national lines, if realised, must be profitable in the very nature of things, because where the cost of the necessary conditions was moderate the work itself was carried out for nothing.

Mr. W. H. Horrocks (London), in a paper on the behaviour of the *bacillus typhosus* in sewage, gave the results of numerous experiments which he had made, and said that these experiments did not by any means prove that the bacillus was not in the sewage. In the section for ladies, Miss Blanche Gardiner dwelt on the necessity for a universal practice and teaching of hygiene; Miss Wadmore on the need of teachers holding recognised certificates in hygiene; and Miss Mabel Proctor urged the advisability of physical education for girls. In the afternoon there were two water excursions, a garden party at Netley Hospital, and a visit to the corporation electrical works. In the evening a lecture to the congress was delivered in Hartley College by Mr. Malcolm Morris on "Tuberculosis."

The last sitting of the Congress was held on Friday, Sept. 1st, when the three sections met as on the previous day. In the Sanitary Science and Preventive Medicine Section Dr. A. E. Cope, Government Teacher of Vaccination, read a paper on the educational factor in the vaccination question and its relation to the securing of the best standard of vaccination, public and private, and Dr. Bushell Anningson read a paper on guarantees of the purity of milk supplies. Mr. Thomas Glover Lyon, physician to the City of London Hospital for Diseases of the Chest, read a paper on "Ventilation for Crowded Buildings, and Consumption Hospitals, with special reference to new methods of distribution and removal of air." This we shall publish in a future number.

In the Engineering and Architecture Section, Dr. D. S. Davies, medical officer of health, Bristol, in discussing the question whether the ventilation of sewers is necessary, said that in Bristol the sewers were totally unventilated, and had been so ever since they were constructed. He quoted statistics, gathered from mortality returns, to show that Bristol was more healthy than many towns where the sewers were ventilated.

Mr. W. Kaye Parry read a paper on sewage purification without filtration.

In the section for Physics, Chemistry, and Biology, Dr. S. Rideal introduced a discussion on the use of preservatives in food. A resolution was passed by the same section recommending the Institute to consider the desirability of taking steps to induce the Local Government Board to relax the requirements they usually make insisting on district councils providing land for the treatment of sewage effluents before loans for sewage disposal purposes are sanctioned, even in cases in which efficient contact beds are arranged for.

In the afternoon the closing general meeting of the Congress was held in the Council Chamber of Hartley College, the President (Sir W. H. Preece) in the chair. A statement was submitted by the Secretary of the Institute (Mr. E. White Wallis), showing that nine hundred and ten delegates had attended the Congress, representing four hundred and fifty municipal and county authorities, learned societies, and other bodies. There had also been present three hundred and seventy members of the Institute, ninety-one associates, three hundred and twenty local subscribers, and five hundred ladies, making a total of two thousand one hundred and ninety-one. Seventy-nine papers had been read and twelve presidential and introductory addresses delivered. Thanks were passed to the Local Committees for the welcome they had given to the members of the Congress and for the hospitality extended, and it was announced that the meeting next year would be at Nottingham.

Dr. Bailie J. Dick in the evening gave a popular lecture in Hartley College on infectious diseases hospitals. The following day (Saturday) there were excursions to various places of interest in the neighbourhood.

Ruskington Waterworks.—At the meeting of the Ruskington Urban District Council on Monday night, last week, Mr. J. Clare, C.E., produced a plan and estimate of the cost of the new waterworks forced upon the parish by an order of the Local Government Board. He stated that the new boring now yielded 220,000 gallons per day, and when Dr. Ashby's analysis was received it would be forwarded to the Local Government Board. He estimated the initial cost at £2075. The plan and estimate were adopted, and it was resolved that the Clerk obtain a loan of the money required. Councillor Cole offered to give the site required for the waterworks, and it was agreed to purchase an additional plot of 200yds. of land for contingencies.

PUBLIC HEALTH CONGRESS AT BLACKPOOL.

THE Public Health Congress was opened at Blackpool on September 21st, when the Marquis of Lorne delivered a presidential address. The Mayor of Blackpool presided, and more than a thousand delegates from all parts of the kingdom were present. The object of the Congress is the discussion of all questions relating to the improvement of the public health and the investigation and study of all branches of State medicine. An exhibition has been opened in connection with the Congress, and will remain open till October 14th. The exhibits afford a remarkable object-lesson on the achievements of sanitary science during recent years, and illustrate all departments of practical work in the interests of the health of the community. A special section has been devoted to appliances for smoke abatement and the economical consumption of fuel, the object being the much-needed improvement of the smoke-polluted air of cities and towns. Innumerable sanitary appliances are exhibited, and there are many interesting models.

On September 22nd, as president of the Municipal and Parliamentary section, Mr. Thomas Loftos, town clerk of Blackpool, spoke exhaustively on the responsibilities of sanitary authorities and their officers in reference to municipal and private undertakings. Any undertaking, except perhaps telephones, which directly or indirectly concerned public roads, promoted public health, provided water supply, lighted towns, or facilitated locomotion, was such as should be in the possession of a municipality, though it should be work of general public character undertaken with a view to the convenience and profit of the community.

A discussion took place in the Congregational Schoolroom on several papers, not the least interesting of which was that by Mr. George Darley, of Leeds, on the disposal of refuse; and in regard to the

Progress of Engineering

during Queen Victoria's reign, Mr. Benjamin Sykes, a North Lancashire architect, maintained that Englishmen were falling back in the race of industrial progress. The Atbara Bridge, the contract for which was given to an American firm, was delivered in six weeks. Mr Sykes further stated that he was engineer for large works in Preston where they had put down buildings and plant capable of turning out two tramway cars per day; all the woodworking machinery, engines, electric motors, and equipments were supplied from America in a remakably short time—within four months from the order being given. The buildings covered an area of between three and four acres. Then on the opposite side an English syndicate had secured eleven acres of land in connection with railways on Preston Dock. They were erecting four acres of buildings for the manufacture of electric equipment, which would be, when completed, the finest works of their kind in the United Kingdom. The roofing and girders were being made in Belgium, the machinery and electric equipment in America, and the engines, boilers, and castings in Bolton and Preston.

Dr. C. J. Whittaker read a paper on the purification of sewage by microbes; and Dr. Hartley Simpson, of Manchester, in another paper, declared in favour of cremation as the most sanitary method of disposing of the dead.

The Smoke Nuisance.

Dealing with the smoke nuisance, Dr. Graham, medical officer of Middleton, said that this had followed in the train of Watt's improvement of the steam engine at the dawn of the century. It was felt in Manchester in 1801, the records of the Court Leet showing heavy fines of owners of factories. The atmospheric impurities were preventable. The evil effects were deterioration of health, destruction of natural and architectural beauty, separation of classes, and increased financial expenditure. The loss of sunlight was a most potent factor. Attention, in our large towns, had been drawn to the dangers by the medical profession; and it had been established as clearly as any law of physics that a manufacturing district might be freed from black smoke, but action was not in accord with knowledge. For many years the community had been instructed on the proper principles on which mechanism for complete combustion could be constructed. The report of the committee formed in Manchester in 1889 showed as a result of observations of 179 chimneys a general average of 102 minutes in ten hours. With coking stokers the average was 16 minutes, but with sprinkling stokers over 100. Since the publication of that valuable report a few new appliances had been brought before the public, also smokeless fuel, but there were sufficient already to enable manufacturers to comply with the law. With regard to the practice of sanitary authorities in dealing with the smoke nuisance there was a great want of uniformity. Voluntary efforts to suppress the nuisance led to the formation of a society in Manchester in 1842, presided over by Lord F. Egerton. Glasgow, Sheffield, Leeds, Manchester, Middleton, and recently London had formed committees to cope with it. One of the principal sources of smoke was from house chimneys. It was less dense than that from factory chimneys, and the smoke was more diffusable and less under control. The evil might be greatly reduced by stoves, and where gas could be cheapened it should be used as a fuel, on grounds both of economy and cleanliness, as it was without smoke. In Birmingham the late Dr. Lawson Tait claimed a saving of £200 per annum in his establishment by its use. The subject of smoke prevention was an important though difficult one for medical officers of health and sanitary inspectors. The methods might be sufficient, but the law was lax, and a better administration of the Public Health Acts should be provided for; and to bring about this a determined pressure on the part of the community was required; he hoped they would not see the present century end without reasonable protection from such a great evil.

Public Health Laws.

On Saturday, September 23rd, the members of the Engineering and Building Construction Section visited the docks and the electric railway and tramway works at Preston. In the course of a paper on "The Codification of Public Health Laws," Mr. H. Brevitt (town clerk of Wolverhampton) pointed out that since the passing of the Public Health Act many important changes had taken place in the law, which had rendered it very desirable that something in the character of a codification should be effected in order to change existing chaos into system and order. "The Law as to Sanitary Conveniences" was dealt with by the town clerk of St. Helen's (Mr. G. W. Bailey), who proposed that the general meeting of the Congress should be recommended to pass a resolution calling the attention of the Local Government Board to the defects in the statutory provisions relating to sanitary conveniences, with a view to their being remedied. Mr. C. L. Hartley, B.A., barrister, of London, read a paper on "Humidity and Ventilation in Factories;" and Mr. W. J. Orsman, public analyst, Wigan, gave some "Notes on the Treatment of Sewage." A paper on "The Sanitation of the Mosaic Law," by the Very Rev. Dr. Adler, the Chief Rabbi, was also read.

Shifnal Builders' Failure.—On Tuesday last week at the Madeley Bankruptcy Court, Messrs. John Bradney, Harry Lloyd, and William Tappington, who have traded at Shifnal as builders, appeared for their public examination. In the statement of affairs the liabilities are put at £3,251, and the assets estimated to produce £2,305. Mr. Bradney stated that they had some heavy losses on contracts, and these, as well as the rise in the price of materials and labour, ended in a collapse of the business. The examination was formally adjourned.

Builders' Notes.

Building Houses on Damp Soil: Fine Imposed.—On September 18th, the York magistrates heard the case in which Cyrus Birkill, builder, was summoned at the instance of the City Engineer (Mr. A. Creer), for a breach of the building by-laws. There were ten separate informations in respect of ten new houses in Kensington Street, Bishopthorpe Road, but the offence charged in each was the same, namely, that the defendant had not caused the whole of the ground surface or site to be properly asphalted or covered with good cement concrete, which was required by the dampness of the site.—The Town Clerk, in his opening remarks for the prosecution, asked the Bench to impose a substantial penalty if they found the case proved. Unless this were done, it would be cheaper for any builder to evade the bye-laws, and be fined. Several building sites in York had a very damp subsoil, and it was absolutely necessary that they should be concreted. He called the City Engineer, who stated that the plans of the houses were passed provided that the site should be covered with 6in. of good concrete. The concrete which had been put down was of an inferior quality of cement, and the material was unclean. He produced a sample taken from one of the houses, which was black, and was easily broken by the chairman of the Bench with his fingers. John Oglesby, building inspector, also gave evidence. Mr. Carter, for the defence, said he should call expert evidence to show that the concrete was good, and sufficient for a damp site. Mr. Chapman de Burgh, for whom the defendant built the houses, had expressed himself satisfied with the work; the architect whom Mr. Chapman de Burgh had employed would tell them he was prepared to pass it, and there had been no complaints from the tenants. After several witnesses had been called, Mr. D. S. Mackay (chairman of the Bench) said the opinion of the magistrates was that the sample was not concrete at all. The case was a bad one, and defendant would be fined £1 and costs for each of the ten houses.—The defendant was allowed a month in which to put in proper concrete.

"Bricks Made in Germany."—At Bow Street Police Court on Monday, last week, Sir F. Lushington sat specially in the Extradition Court for the further hearing of an adjourned summons against T. W. W. Jee, A. E. Smith, A. Legge, J. L. Schiefer, and John Haggis, charging them with conspiring to obtain a bill for £50, a cheque for £10, and a quantity of bricks and cement, from Paul Borsch, of Chancery Lane.—The complainant imports bricks from Germany, and sells them on commission. In October last he arranged with the defendants Jee and Smith, who are estate agents, to pay them a commission on all orders obtained through them, and they introduced him to the other three defendants, who are builders, and who gave him orders. Trade references were given with their orders, and a report from Stubbs's Agency, and the complainant supplied part of the bricks on bills for £50 being advanced him to pay for lighterage. The bricks were not paid for, however, and the complainant now alleges that he has been deceived by part of Stubbs's report being kept back from him, and that the three builders were not in a position to entitle them to credit. On the last occasion it was shown, however, that the bricks he supplied had been condemned by two district councils, and that Schiefer had been fined over £100 for using them, while a previous summons charging Smith with fraud in this matter had been withdrawn on payment by him of £60. Arthur Pamphlett, one of Stubbs's representatives, said that in their reports respecting the three builders they recommended that all transactions with them should be on a cash basis.—After further evidence, Sir F. Lushington said that as regards the three defendants, Legge, Schlefer, and Haggis, there was not one tittle of evidence that they knew anything of the proceedings of Jee and

Smith, and they would be discharged at once. With regard to Jee and Smith, he did not consider that any case had been made out on which a jury would convict, and they, too, would be discharged.

Masters and Men.

A Building Trades' Friendly Society at Derby has been formed for non-union workmen.

The Working Slaters of Musselburgh have received an advance of ½d. per hour, making 8½d.

Strike at Havana.—A strike of men employed in various industries has occurred at Havana. Twelve thousand men are now out.

The Joiners of Dunfermline have succeeded in obtaining an advance of ½d. per hour on their wages, which are now 8½d. per hour.

Newport Building Trade Dispute.—Workmen state that only 150 members of the various men's lodges, are now left in the town, the remainder having obtained employment through their societies elsewhere.

The Carpenters and Joiners of New York have declared a general strike for an increase in wages. Six thousand men are affected. It is the largest strike in the trade that has occurred for a dozen years.

The Plasterers of Bristol Struck Work on Saturday, owing to the masters refusing their demand for an increase of a halfpenny per hour. The masters, under the new rules, ask for six months' notice of demand for any increase of wages.

The Dispute in the Building Trade at Grimsby, which has been a somewhat lengthy one, has been definitely settled by the decision of the Master Builders' Association to accede to the bricklayers' request for 9d. per hour instead of 8d. During the dispute about 100 bricklayers secured employment in other towns, but it is expected that many of them will now return.

Ironworkers Demand Higher Wages.—The Scotch ironmasters have received a circular from the Scotch Amalgamated Society of Steel and Ironworkers demanding ten per cent. advance in wages. The men hold they are paid less than their brethren in the North of England, who work only eight-hour shifts against twelve-hour in Scotland. The masters will resist the demand.

The Hull Building Dispute.—The number of members of the Joiners' Society now receiving strike pay is about 100, and they are receiving 22s. a week; there are between seventy and eighty builders' labourers out; and there have not been more than a dozen bricklayers on the books for some weeks past. It is reported that two Hull master builders have seceded from the Masters' Association, and it is regarded as quite probable that others will follow suit, and thus assist to bring about a settlement of the long-existent dispute.

The Building Trade Dispute at Leeds.—At a recent meeting of the Leeds branch of the Manchester Order of Bricklayers, the building trade dispute, so far as it related to Leeds, was briefly discussed, and it was decided that the attitude of the Manchester Order should remain the same as it has been throughout the struggle. The members of the Manchester Order, it will be remembered, have remained at their employment. The London Order, on the other hand, ceased work at the beginning of the crisis. A few weeks ago the Yorkshire Federation of Master Builders thought that a settlement might be effected by granting to them an advance of ½d. an hour, but this recommendation on being brought before the Leeds employers themselves was rejected, so that matters at present are in practically the same condition as was the case at the outset. A large number of the members of the London Order, however, have obtained work elsewhere.

A Strike Amongst the Plasterers at Nottingham has just occurred. The men complain that some members of the Master Builders' Association have been employing bricklayers to do plasterers' work, and with this grievance as a basis some fifty or sixty of them, all of whom are employed by federated employers, handed in their notices a week ago. These expired on Saturday, and nothing further having been said by the employers the men left work. There is no prospect of a spread to any other branches, at any rate at present, and the dispute does not assume large proportions. Certain firms in Nottingham have been put upon the "black list" by the National Association of Operative Plasterers, and as a result the bricklayers have still been employed and have done their work, it is reported, in a satisfactory manner.

The Engineers and the Trades Union Congress.—In the report of the Amalgamated Society of Engineers for September, Mr. G. N. Barnes, the General Secretary, has a final word with regard to the expulsion of the Amalgamated Society of Engineers from the Trades Union Congress. He says: "We have received shoals of letters, mainly from branches, but some from individuals both inside and outside our ranks, and all endorsing the line we have taken in the matter. Trade Unionism cannot exist as a beneficent force in the nation if it is to consist of a heterogeneous collection of bodies mutually exclusive and antagonistic to one another and to everyone outside of their own borders, and so long as the men who control the Congress regard it as such we must remain outside. We believe in Trade Unionism as something which should intelligently gather up and focus working-class opinion as a whole, harmonising its various phases as far as possible, and making it effective in the interests of all labour. If our quitting the Congress will conduce to that, such quitting will prove of greater service to labour than anything done during our thirty-two years' connection."

The Building Trade Dispute in Leicester.—Sir William Markby, acting as Board of Trade arbitrator made his award last Saturday, on the dispute in the Leicester building trade. The matter referred to him for decision arose out of a demand of the Builders' Labourers' Society, Leicester, and of the Navvies, Bricklayers' Labourers, and General Labourer' Union, Leicester Branch, for an advance of wages of 1d. per hour. The subject matter of the dispute is stated in two applications, one addressed by Mr. Thomas Stevens to Mr. W. E. Starkey, and the other addressed by Mr. J. W. Morris also to Mr. Starkey. The present dispute relates to the bricklayers' labourers only. By rule 1 of the working rules of the Builders' Labourers' Society, by which the Navvies, Bricklayers' Labourers, and General Labourers' Union were also governed, the standard rate of wages for bricklayers' labourers was fixed at 6d an hour, and Sir W. Markby was asked to alter that demand to 7d. His award was that the rate of wages should henceforth be 6½d. an hour, and with regard to the re-instatement of the men on strike, he directed: "That the master builders shall reinstate all their old workmen at as early a date as possible, and before putting on any new hands; and that the bricklayers' labourers shall not interfere with any men at present employed, except by using any legal means to induce such of them as are not members of either of the above-mentioned labourers' unions to become so." The award will be carried out by both parties.

Engineering Notes.

Naval Extension Works at Devonport.—It is stated that the Admiralty have decided upon a scheme of naval extension works at this dockyard, second only in importance to the Keyham Dockyard extension.

The Cottage Hospital, Lytham, is being warmed and ventilated by means of Shorland's patent Manchester grates and special inlet tubes, supplied by Messrs. E. H. Shorland and Brother, of Manchester.

Electric Lighting at Epsom.—A Local Government Board inquiry was held at Epsom on Thursday, into the application of the Urban Council for permission to borrow £16,000 for electric lighting purposes.

Lawrenny Castle has just been fitted by John King, Limited, engineers, Liverpool, with their latest improved "Small Tube" hot water heating apparatus with special economical coil heater and water way firebars.

The Lighting of Newcastle.—At a special meeting of the Lighting Committee of the Newcastle Corporation, held on September 18th, it was unanimously agreed to recommend the City Council to light by electricity all the streets in the city through which the new tramways are to run.

Institution of Electrical Engineers.—Professor Silvanus P. Thompson, President, and Professor W. E. Ayrton, Past President, having been invited to take part in the Volta celebrations at Como, have been chosen by the Council to represent the Institution as delegates on this occasion.

Electric Lighting for Newark.—A special meeting of the Newark Town Council was held on September 18th, to receive a recommendation of the Electric Lighting Committee on the supply of electricity to the borough, and as to an application for a provisional order. Mr. W. E. Knight stated that the probable cost of the scheme would be £16,000. After a lengthy discussion, it was decided to apply for a provisional order, and to have a public meeting of ratepayers.

A New Tunnel.—Under the River Spree, at Berlin, there is now being constructed the first subaqueous tunnel in Germany. It is intended to accommodate a tramway route connecting the Silesian railway station with the suburb of Treptow, and has a total length, including approaches, of 2020ft., 1500ft. of which constitute the tunnel proper. Since the introduction of iron as a substitute for the older stone or brick linings of tunnels, the usual method has been to construct them of cast-iron segments, bolted together through flanges and lugs provided for the purpose. In the tunnel under the Spree cast-iron is discarded in favour of steel, which forms a cylindrical casing, having an internal diameter of 13ft. 2in. The lowest part of the tube is 35ft. beneath the mean water level of the river, so that, given a depth of water of 11ft., there remains a thickness of the same amount between the upper part of the tunnel and the bed of the stream. Steel plates 2ft. 3in. in length, with their butt joints covered by double angle steels, are built up to form the lining, and are protected externally from corrosion by a thick layer of cement. In the lower part, or invert, concrete is used to bring the floor of the tunnel up to track level, below which is laid a longitudinal drain to carry off any water that might accumulate, which will be pumped out as required by electric power. The piercing of the tunnel was effected by the shield and compressed air (as with the Blackwall Tunnel) through strata composed of mud and dirty sand, the maximum hydraulic pressure available amounting to nine hundred tons. The work was commenced in 1895, and it is expected that the tunnel will be opened for traffic next year.

Surveying and Sanitary Notes.

Straw Paving.—A Berlin patent agency announces that a Polish engineer has discovered a method of chemically treating straw, so that it can be pressed into a substance as hard as stone and cheaper than wood-paving, for which it is expected to prove a substitute.

Otley's Sewage Disposal.—Mr. R. H. Bicknell, M.Inst.C.E., on behalf of the Local Government Board, last week conducted an inquiry into an application by the Otley District Council for sanction to borrow £4,500 for the purposes of sewerage and sewage disposal works.

Ripon Street Improvements. — An inquiry was held at the Town Hall, Ripon, on Wednesday, by Mr. R. H. Bicknell, M.Inst.C.E., with respect to an application by the Corporation of Ripon to borrow £3,060 for the widening of Fishergate, one of the three parallel and narrow streets leading from the Market Place into North Street.

Dinas Powis Sewage.—Mr. H. P. Boulnois, inspector to the Local Government Board, held an inquiry at Dinas Powis recently, with reference to the application of the Llandaff and Dinas Powis Council for sanction to borrow £11,000 for the purpose of sewerage works for the parish of St. Andrew's. The proposed outfall is in the parish of Sully. Opposition was raised to the proposed plan by the Barry District Council and several local landowners.

Proposed Improvements at Worcester.—Colonel A. J. Hepper, Local Government Board Inspector, held an inquiry, on Tuesday, last week, at the Guildhall, Worcester, into the proposal of the Council to borrow £16,250 and £800 for the purchase of land for street improvements.—Mr. S. Southall (town clerk) explained that the £16,250 was for the purchase of land in High Street for the widening of the thoroughfare opposite the Old Bank and extending to the Cross. The £800 was for the acquirement of land to complete Trinity Street and extend it to St. Nicholas Street.

London Main Drainage and Storm Flooding.—Mr. Frank Dethridge, vestry clerk of Paddington and president of the Metropolitan Local Government Officers' Association, has, at the instance of his vestry, addressed a letter to the London local authorities north of the Thames, inviting them to send delegates to a conference, to be held at Paddington Vestry Hall early next month, for the purpose of "urging upon the London County Council the absolute necessity of at once taking steps to improve the main drainage system north of the river, and thus prevent flooding of the basements of houses in the low-lying districts in time of storm."

Bath Sanitary Committee.—At the fortnightly meeting of this committee, held on September 18th, a discussion arose about some rooms in Somerset Street having windows that could not be opened at the top, the question being as to whether proceedings should be taken. The Medical Officer and the Inspector thought this deficiency of light and ventilation was injurious to health, but the former admitted that the case was not a strong test one. It was agreed that the officers should select the strongest case they could find, in order that proceedings might be taken. The new bye-laws, it was stated, contained a clause to the effect that all windows in new houses should open at the top.

Sewage Works for Halifax.—The construction of new sewage works for Halifax has been commenced. The estimated cost of the whole scheme is between £50,000 and £60,000. The work is being carried out in sections, and already two contracts have been let. No. 1 contract involves the diversion of the Hebble Brook, which passes through the site of the intended sewage tanks at Salterhebble, the amount of the tender being about £3,000. Alderman Walsh, chairman of the Highways Committee, recently laid a corner stone in connection with this portion of the scheme. The contractors (Messrs. Bower) presented him with a handsome trowel and mallet. The Corporation have also accepted the tender of Messrs. Bower for the works required in building eleven precipitating tanks, two sand tanks, and one receiving tank, and for carrying out appurtenant works at a cost of £12,800. The combined capacity is 3,706,000 gallons—somewhat above the ordinary flow of sewage in twenty-four hours—and, on the eight hours rest system, more than 10,000,000 gallons can be treated per day. The tanks are to be arranged so that they can be filled with sewage from an inlet about 3ft. below the surface, in order that the sewage may be treated in the open tank; or, if found necessary at any future time, the tanks may be covered over, and the sewage treated upon the septic tank system, which is applied to a portion of the domestic sewage at Exeter. They are also so arranged that by slight alterations and additions any chemical treatment may be applied.

Property and Land Sales.

FREEHOLD BUILDING ESTATE, fronting on main road and close to golf links and Highgate Woods, seven minutes' walk from Muswell Hill and East Finchley stations. To be LET on lease or SOLD in plots. Liberal advances to responsible builders if required. For plans and particulars, apply to Mr. GEORGE H. PAINE, Architect and Surveyor, 6, Stoke Newington-road, N. 4

TO BUILDERS AND OTHERS.—LOXFORD HALL ESTATE, ILFORD.—In a very important position, within easy reach of Ilford and Barking Stations, with their unrivalled rail facilities to the City, and in close proximity to the Ilford and Barking public parks, 50 Plots of thoroughly eligible FREEHOLD BUILDING LAND, having important frontages to Ilford-lane, Hampton, Henley, and Mortlake roads, with good depths, and absolutely ripe for the immediate erection of shops and villa residences, for which the demand at Ilford is so increasingly keen. Free conveyances. Payment by instalments.

MESSRS. KEMSLEY will SELL the above by AUCTION at the Angel Hotel, Ilford, on WEDNESDAY EVENING, OCTOBER 4th, at SEVEN o'clock precisely.

Particulars of Messrs. PATERSON, SONS, and CANDLER, Solicitors, 26, Bouverie-street, E.C.; and of the AUCTIONEERS, 41, Bishopsgate-street-within, E.C., and at Woodford Green and Romford. 1

BLUE COAT GIRLS' SCHOOL CHARITY ESTATE, GREENWICH, S.E.

To be LET by TENDER, on a repairing lease for 21 years, eleven conveniently-situated FREEHOLD HOUSES, with gardens, being Nos. 133, 135, 137 (The Little Wanderers' Home), 143, 145, 147, 149, 151, 153, 155, and 157 Greenwich-road, Greenwich, S.E., estimated to produce a rental of about £428 per annum, situate in a populous district, on a main road, and within two minutes' walk of Greenwich Station (S.E.R.)

Tenders for the above are invited, and must be sent in by SEPTEMBER 23rd next to the Offices of Messrs. BATCHELOR and BATCHELOR, the Clerks to the Charity, 52, Croom's-hill, Greenwich, S.E.

Intending takers may view the property at any time by permission of the respective tenants, and particulars and conditions of letting, and forms of Tender annexed, and any further information desired may be had gratis at the Offices of Messrs. BATCHELOR and BATCHELOR, the Clerks to the Charity, 52, Croom's-hill, Greenwich, S.E., and 15 and 16, Outer Temple, Strand, W.C.; and of Mr. THOMAS DINWIDDY, Croom's-hill, Greenwich, S.E., the Charity's Surveyor.

An acre of singularly valuable Freehold land, 270 yards from the Stock Exchange and opposite the north end of Throgmorton-avenue, Throgmorton-street, City, to be let upon 80 years' building lease direct from the Corporation, with a fully-licensed house thereon.

MESSRS. REYNOLDS and EASON are instructed by the Bridge House Estate Committee of the Corporation of the City of London to LET by PUBLIC AUCTION, at the Mart, Tokenhouse-yard, in OCTOBER, 1899, the above singularly valuable SITE of 44,038 square feet, with extensive frontages on Blomfield-street, London Wall, and Finsbury-circus.

Particulars, plans, and conditions of letting may be had, when ready, either of the City Comptroller, or the City Surveyor, Guildhall, E.C.; at the Mart, Tokenhouse-yard; and of the AUCTIONEERS, 43, Bishopsgate-street Without, E.C.

Unique Sites for Docks and Shipbuilding, extending from Chepstow Station to River Wye.

MESSRS. DRIVER, JONAS, and CO. beg to announce that they are honoured with instructions from his Grace the Duke of Beaufort to SELL by AUCTION, at the Beaufort Arms Hotel, Chepstow, on THURSDAY, OCTOBER 5th, at 10.30 a.m., in One Lot, 40 acres of valuable FREEHOLD LAND, similarly situate to the Llanarth Docks, Newport, Mon., having a frontage of about half-a-mile to the River Wye, and forming the entire block between the river and the Great Western Railway. The Chepstow Station is on the property, which has direct access from the town by the Station-road, and is especially suited for new docks, shipbuilding yards, engineering modern manufactures, or other large industrial enterprise, for using the tidal power, here the second highest in the world, the exceptionally favourable circumstances of which are seldom found in large ports. It includes the Chepstow Cattle Market, bonded yard, landing stage, and rich meadows, all let, at £140.

Printed particulars and plans may be obtained of Messrs. WILLIAMS and JAMES, Vendor's Solicitors, Norfolk House, Thames Embankment, London, W.C.; of JAMES GRAY, Esq., Solicitor (Messrs. Pemberton, Cope, and Gray), 5, New-court, Lincoln's-inn, London, W.C.; of S. H. COWPER COLES, Esq., Estate Office, Troy, Monmouth; and of Messrs. DRIVER, JONAS, and Co., Surveyors, Land Agents, and Auctioneers, 23, Pall-mall, London, S.W.

Special three months' finishing courses.—For full particulars apply to Messrs. HOWGATE and BOND, Associates R.I.B.A., Perchard House, 70, Gower-street, W.C. (close to the British Museum.

ARCHITECTURAL Institute, Society of Architects, and Civil Service Technical Examinations. Preparation by correspondence, personally, or in residence. Seventeen first places.—MIDDLETON and CARDEN, 19, Craven-st., W.C.

CITY OF LIVERPOOL.

SCHOOL OF ARCHITECTURE AND APPLIED ART,
UNIVERSITY COLLEGE.

Sixth Session 1899-1900, commences Monday, October 2. In Architecture, a Two Years Course of preliminary training is provided for students to pass through before entering an Architect's office. Classes are also held in the Day and Evening for pupils and assistants already in offices. An Advanced Class in Design is held in the evening. Classes are held in Modelling and Designing Ornament and the Figure suitable for Sculptors, Modellers, Carvers, Plasterers, &c.; in Drawing, Painting and Decorative Design, the last being divided into two classes, specially arranged for students who wish to take up Decorative Work; in Wood Carving and Wrought Iron, especially in their relationship to Architecture; in Brass and Copper Work; in Stained Glass; in Enamelling, in Furniture and Fittings Construction, and in Furniture and Fittings Design.

Six Free Studentships are offered to the day classes, and Crafts' Studentships for students before entering their apprenticeship.

Eighteen Free Studentships are offered to the evening classes, two to each of the above-mentioned classes. Prizes are awarded at the end of the session to the most successful students.

For details of Classes, Free Studentships, Prizes, and all further particulars, apply to the Director,

PROFESSOR SIMPSON,
1 University College.

ANSELL and MALLOWS, Architectural Draughtsmen and Quantity Surveyors, 21, Buckingham-street, Strand, W.C.

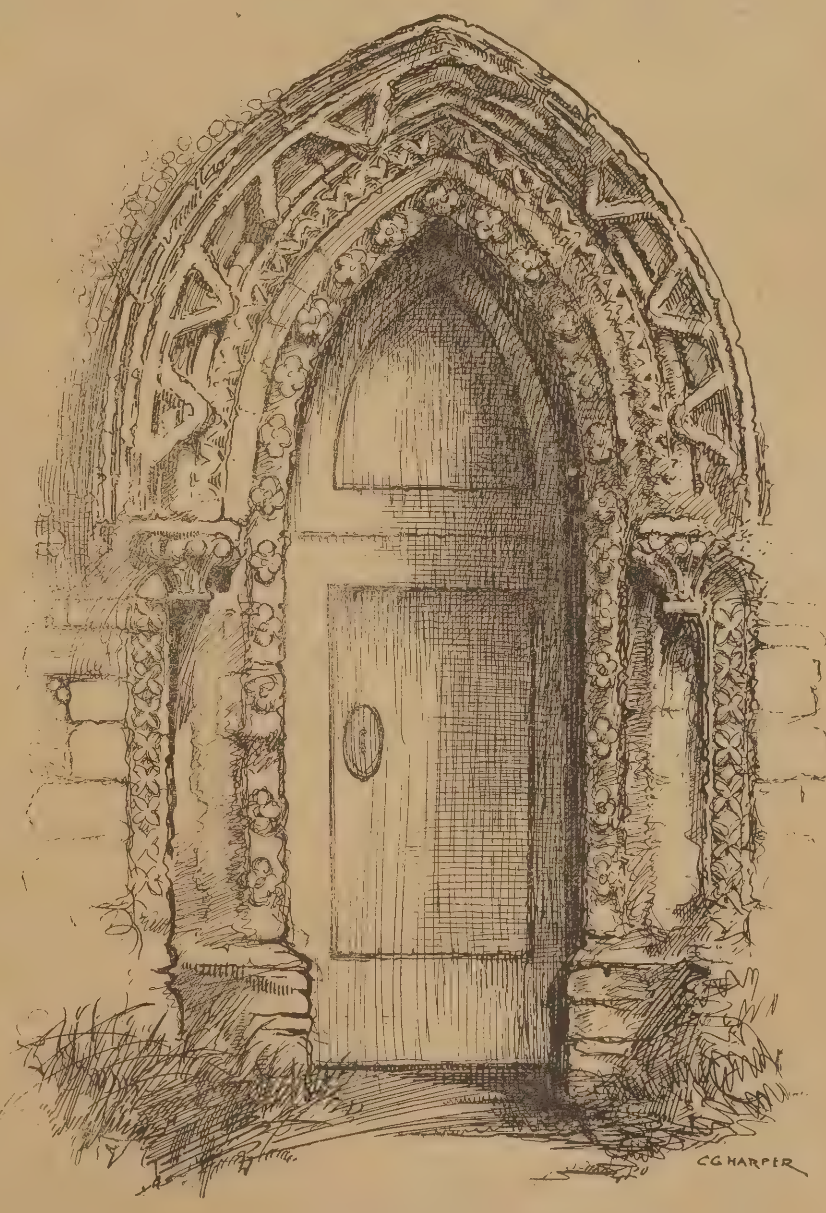
Megalomania. THE passion for hugeness appears to exercise a curious fascination upon mankind, and constantly reappears at intervals in the world's history, the impressiveness which undoubtedly does attach to great masses of material, when ordered and arranged with proper consideration for proportion, being supposed to attach to the mass of material and not to the design. One can understand that in the early days of the world's history the mere size of a thing produced fear and awe, for man was not then master of weapons of destruction with which to neutralise the attack of great beasts, and to turn their onslaught into defeat; nor had he the means of controlling natural forces and making them subservient to his requirements. But all this is changed now, and it is known that the most powerful forces of Nature may be directed and controlled by relatively small instruments; yet the passion for bigness still persists.

The Greeks discovered that it was not necessary for a work of art of any kind to be huge to be impressive, and most of their temples and statues were of moderate size, though even they, the keenest and most cultivated of the ancients, occasionally erred, as witness the Temple of the Giants at Agrigentum; but their example was soon forgotten, and the barbaric delight in size and multitude of parts resumed its sway. All through the period of the Middle Ages towns were vying with each other, each striving to have the highest tower, the largest church, or the deepest toned bell in the communal belfry, and Italy, in particular, is strewn with the unfinished carcasses of abandoned ambitions. To note only two—at Bologna the traveller sees the unfinished western façade of the Church of St. Petronio, the bare rubble work of the west wall of which soars high above the beautifully finished sculpture around the doors where Jacopo della Quercia, Nicolo Tribolo, and their fellows breathed a soul into the senseless marble; and the finely proportioned interior consists solely of nave and side chapels, the building having stopped when the transepts were reached; and at Siena the cathedral nave is but the transepts and crossing of the building as originally designed, a portion of the beautiful nave arcade standing outside in the piazza to testify to the original plan. Many other instances might be quoted in which the builders evidently did not count the cost before commencing to build, or built with an unfounded faith in the extent of their resources. The same desire for the impressiveness of vastness gave us the long perspectives and spacious courtyards of such palaces as Versailles, a type of many others in France and other countries, and still gives us, on the other side of the Atlantic, the immense office buildings of New York and Chicago.



NORTH DOOR, STONE CHURCH. DRAWN BY C. G. HARPER. (*See p.* 129).

The idea that great size must necessarily imply strength appears to be ingrained in the human mind, and the first idea of every one who wishes to have a fine thing seems to be to make it big. Yet, in fact, it is not absolute but relative size which impresses, and this can only be realised by the employment of proportion and contrast, the just use of which may give the impression of majesty to a building which is comparatively small, while the immense erection with its interminable rows of windows may, lacking these, not only fail to impress, but look much less in size than it actually is. Our great hotels, which blot out the sunlight from the streets amid which they tower aloft, making them feel like wells, may gain in the efficiency of their management by their immense size, and the public rooms in such places may be more expensively decorated than would be possible in smaller establishments; but this palatial gorgeousness is a doubtful advantage to art, and certainly there are few of them which can compete, either in beauty or impressiveness, with far smaller buildings raised a couple of hundred years or more ago.

S. S. G.

The Uses and Limits of Perspective.

To judge by the large proportion of perspective, as opposed to geometric, drawings which are published in the professional papers, it would appear that architects and their assistants spend a good deal of their time in making perspective representations of the buildings which they design, while it is well known that perspective specialists are paid highly for their work, and the inquiry is natural as to what is the good of it all. At first sight it would appear to be labour entirely thrown away. To enable a building to be carried out in accordance with its design, geometrical drawings alone are necessary, and a capable designer will understand as well how his building will look when completed without as with a perspective drawing. But to the uninitiated it is different. To the average client and the average competition committee a set of geometric plans, sections, and elevations is entirely incomprehensible, while a well prepared perspective appeals at once.

Even the plan would probably be far better understood if it were set out in isometric projection, showing the walls some few feet high; but instead of this, the attractive perspective drawing has been developed, and the time expended on its production has been found in numberless instances to have been well laid out. Its use is for the purpose of advertisement, to speak plainly; for its artistic merit is not great, exemplifying rather the skill of the draughtsman than the art of the designer and creator when at its best, while at its worst it is capable of giving false impressions, being easily "cooked," allowing of the subjugation of bad features and the undue emphasising of good ones, and almost always being accompanied by wholly fanciful drawing of surrounding scenery.

Then, again, each view can only give one aspect of the building, as it will be seen from one point only; and it is by no means an unknown thing for a draughtsman to select a wholly impossible point of view, choosing it because, theoretically, that alone would give a pleasing result. The note to be sounded, therefore, is one of caution and distrust. A perspective may be truthful, may give a really good representation of the finished building and its surroundings, and it may even be helpful to its designer in showing him where improvements either of detail or of grouping could be effected; but it may be, and more often is, utterly false, a draughtsman's exaggeration, or even a draughtsman's lie, open to the most definite condemnation. All the same, perspective drawing should not be neglected. He who possesses a full understanding of it can often assist himself when in doubt in designing, by sketching the doubtful group or the doubtful detail as he expects it to be seen; he can at times express to a workman his meaning as to a piece of construction, as a mere geometric draughtsman cannot do; and he can detect the lie, if such be there, in the tricky sketch of another. But he must avoid the lie himself, as strictly as he would avoid the spoken lie.

G. A. T. M.

On Reflection.

Building By-Laws in Rural Districts.

THERE has long been a strong feeling amongst architects and builders whose practice lies chiefly in rural districts that the building by-laws enforced by the Local Government Board are unnecessarily—even mischievously—restrictive. There have lately been indications that District Councils are beginning to take the same view. In Dartford, Eynsford, and Sutton-at-Hone, the local councils have been in communication with the Local Government Board on the subject, and have secured certain concessions which, though still inadequate, will serve very well as a starting point. The Board has sanctioned the building of one-storey cottages or bungalows, provided they do not exceed 600ft. in superficial area and 6,000ft. in cubic capacity, and provided, also, that they are separated from each other by a space of not less than 200ft. Obviously these restrictions greatly detract from the value of the concession, and it is difficult to see their necessity. The Local Government Board is naturally and rightly unwilling to sanction any building methods which tend to increase the danger to life and property through fire, and one can readily appreciate the desirability of limiting the height of wooden buildings; but the necessity for limiting the superficial area is not so apparent. The stipulation for an interspace of 200ft. seems altogether excessive, and effectually prevents the use of these buildings for the purposes they are generally intended to serve, namely, for agricultural labourers' dwellings. It is obviously impossible to provide a 200ft. frontage for a cottage which is to be let at 3s. or 4s. a week. We hope the councillors of these Kentish parishes will keep pegging away until a concession of really practical value is obtained. The authorities of the Local Government Board are apt to look with suspicious eyes upon representations made by architects and builders who are desirous—primarily, of course, in their own interests—to be allowed to build in the cheapest materials. But when similar appeals are made to them by disinterested bodies representing the public as a whole, the desired reform will not—we may fairly hope—be much longer delayed. If it is to the architect's advantage that he should be allowed, without vitiating restrictions, to build small wooden dwellings in country districts, it is not less to the advantage of the agricultural labourer for whom such dwellings are intended. Cheap construction means low rent, and increased opportunity for the occupier to become the owner of his house. Moreover, a wooden bungalow standing in an ample plot of ground may well be far more healthy and comfortable than a cottage in a terrace with only a few feet of garden at the rear.

Ancient and Modern Building.

UPON turning to the writings of old historians and chroniclers, we are told how our forefathers erected their churches and abbeys, and though their rate of progress would doubtless raise the modern speculator's mocking smile, it is very evident that we might with advantage attempt to copy them in the matter of solidity. Nobody can say that their walls were too thin or that the materials they used were defective. Mortar without lime is a novelty of the comparatively modern builder. It seems very ridiculous when we still have standing abbeys, cathedrals, and village churches built hundreds of years ago, that a clergyman should have to declare to his congregation that he was obliged to authorise immediate repairs to be made to his church in order to save the fabric—when it has only been standing twenty-eight years. Yet such is unfortunately the fact in the case of the church of St. Mary at Beswick, near Manchester. The early builders insisted on the stability of their erections. Would that their more modern brethren were equally emphatic, and then it would not be necessary to record that a church built in 1871 needed a thorough overhauling in 1899. With the jerry-built villa and the jerry-built cottage we have long been unhappily familiar, but it is with something of a shock that one learns that our modern builders of the baser part are applying their shoddy methods to the building of churches, where—if anywhere—honest workmanship might reasonably be expected.

The L.C.C. and Old Buildings.

TIME rushing along at a prodigious pace, with an army of councillors and builders at his heels proclaiming the requirements of a new population. Such is the picture—and the result is that one after another some historic house or landmark comes under the auctioneer's hammer, and is added to the long list of those set down for destruction. In no other place is this so evident as in London. "At Southwark in the Tabard as I lay . . ." sings good Geoffrey Chaucer, but where is now the Tabard? Staple Inn we still have with us, but the "Old Bell" in Holborn, taverns in Fleet Street closely associated with noted men of letters, numerous famous old houses in the suburbs—these are no more. Some time ago the London County Council devoted considerable attention to the question of preserving historic properties, and, through the powers they have since acquired, it is a pleasure to know that when future public improvements have to be made artistic and architectural considerations will not be altogether overlooked. The Council have just made another move forward in the right direction, for they have established, as a permanency, a photographic department, whose duty it will be to see that, when it is inevitable that interesting buildings shall be pulled down, pictorial records are, in all cases, made. Photographs are also to be taken when the alignment of a street is altered. We are glad that such an innovation has been made, as not only will the record thus obtained be of archæological and historic value, but it will doubtless be put to practical use when those occasional disputes occur affecting boundaries or the precise position of dismantled buildings. France and other European countries have for some time past nominated an official with authority in relation to these matters, and it is gratifying to see that the London County Council are attempting to see things from an æsthetic standpoint, and are following in the steps of our less practical foreign friends. The chief benefit will be reaped by the next generation, for, unlike us, they will be furnished with accurate representations of those structures which, though perhaps familiar to them by written descriptions, would otherwise belong to the vague and distant past.

VIEW LOOKING OVER STONE. DRAWN BY C. G. HARPER.

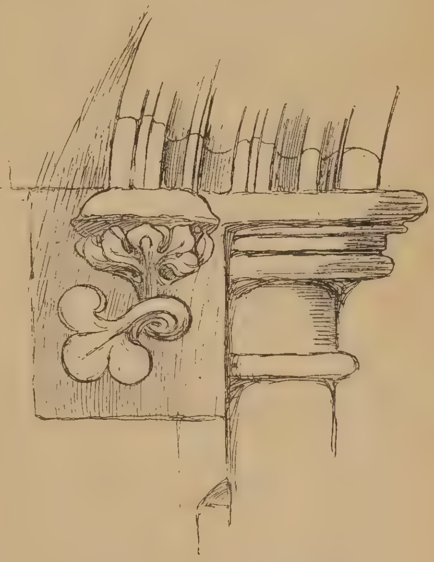
STONE CHURCH, KENT.

By CHARLES G. HARPER.

STONE CHURCH, one of the most beautiful and interesting in Kent, stands on a hill top a short distance from the left-hand side of the old Dover road, in the immediate neighbourhood of Greenhithe, and commands a wide view of the Thames. To architects and lovers of architecture it is remarkable on account of the striking similarity its rich details bear to those of Westminster Abbey, and it is generally considered that the architect of the one designed the other. This is the more remarkable since the Abbey, with this exception of Stone Church, stands alone in England as a beautiful and peculiarly personal example of Gothic thirteenth century architecture as practised in France. The architect of Westminster Abbey must have been of French nationality, and so curiously similar, in little, are not only the details of both church and abbey, but also the varieties of stone of which they are built, that they are most unlikely to have been the work of different men. Records, too, prove both to have been in course of building at the same time, towards the end of the thirteenth century, when the style known as Early English had reached its full development and was about to merge into the Decorated phase of pointed architecture.

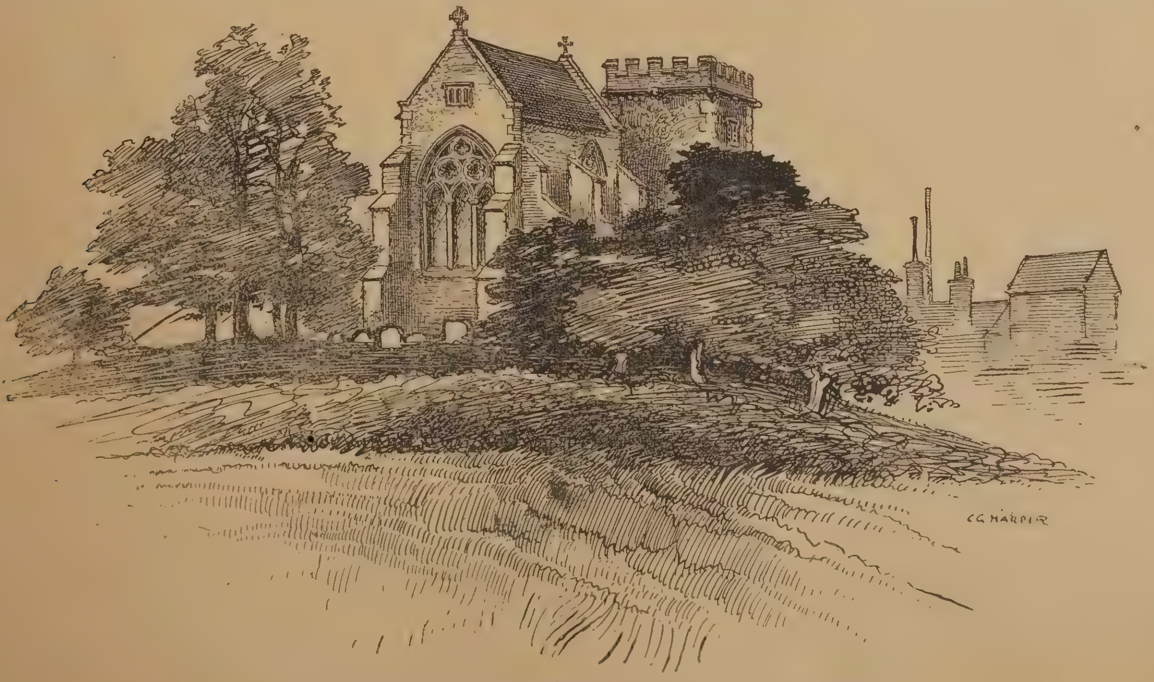
The style we call Early English was also in vogue in France, with this difference—that the French cathedrals and churches were characterised by a greater height in proportion to breadth than our own, a variation of treatment which sometimes gives to French work the appearance of an inordinate slimness and a corresponding look of insecurity. The pitch of French roofs, too, followed the loftiness of their design and was extremely acute. All these unfailing marks of nationality are seen at Westminster, and they are repeated, *in petto*, of course, at Stone, in those portions that have remained unaltered since the building was erected, *circa* 1250-80.

Stone Church consists now of chancel, nave, north and south aisles, western embattled tower of an extraordinarily massive character, and a vestry north of the chancel. Of these portions, the vestry is an addition of a century later; the tower has been altered as to details and the character of its piers changed; and certain windows of Decorated character inserted in place of the original developed lancets. The chancel has an arcade running round its three sides, and a chancel arch of great beauty divides it from the nave. On arch and arcades alike is a great deal of that beautiful conventionalised foliage, which is everywhere one of the greatest glories of Early Pointed architecture, and here it is seen in its full beauty, both of development of design and in artistic execution. A few years later than the date at which this work was done, architectural foliage decayed, in the ill-advised attempts that were made to directly imitate Nature in stone without the proper restrictions of conventional design. After the enrichments of the interior, the most remarkable feature of the church is the north door, a work whose beauty is only surpassed in this part of England by the chapter-house doorway at Rochester; and that, it must be borne in mind, was never intended to bear the rude assaults of all weathers, while this is in direct exposure to the elements, and has suffered accordingly. But it seems probable that this doorway at Stone had at least the protection afforded by a wooden porch, although nothing now actually remains to show that this was the case.



LABEL STOP, STONE CHURCH.

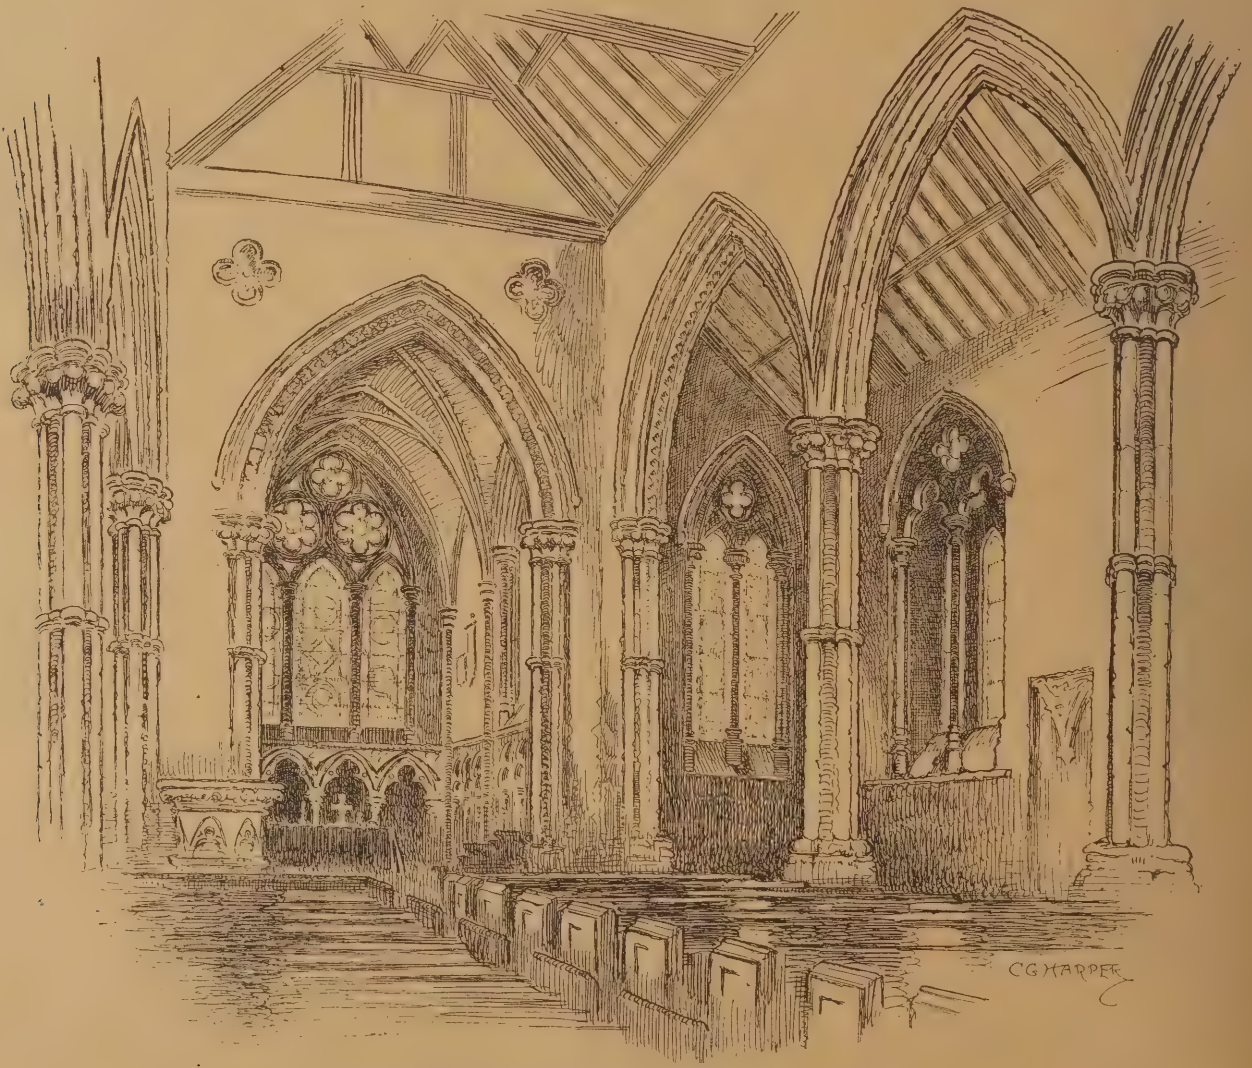
In this interesting corner of England it is curious and instructive to notice with what an artistic appreciation the old architects selected the best work of their predecessors for imitation, adding to it their own designs. At Canterbury this is particularly noticeable in the choir, where the Early English architect (his nationality was Norman, for he was William of Sens) employed alternately the round Norman arch and the pointed one of the newly-born first Gothic style; and where he grafted Early English details upon Norman outlines. Here their eclecticism, which is



STONE CHURCH FROM NORTH-EAST. DRAWN BY C. G. HARPER.

seen so rarely in other parts of England, is shown in the mouldings and decorations of this north doorway, where the Norman chevron is used in conjunction with ornaments peculiar to thirteenth century work. The drawing of this beautiful doorway is purposely copied from Cresy's work of some fifty years ago, in order to show these details, for of late years, unhappily, nearly all the carving has perished.

The history of Stone Church is equally interesting with a study of its architectural style, for it was built with the aid of offerings made at the shrine of Saint William of Perth at Rochester, and was evidently begun on a more elaborate scale than the resources of Rochester could afford to bring to a logical conclusion. This may be observed, first, from the exterior, where the chancel is noticeably higher than the body of the building, and, secondly, from within, where the chancel roof is seen to be vaulted and groined in a manner more like that of a conventual church on a small scale than that of a building devoted merely to parochial use.



INTERIOR OF STONE CHURCH. DRAWN BY C. G. HARPER.

In fact, the whole style of Stone Church decreases in ornateness as it proceeds westwards. The groined and vaulted chancel, more lofty than any other portion, gives place to a nave, beautiful indeed, with its light arcades and chaste proportion, but roofed in timber instead of stone.

This gradual declination may be noted also in the difference between the easternmost arches of the nave arcade and the others, the first being elaborately ornamented with dogtooth moulding, while the mouldings of the rest are plain. The same applies to the windows; one only of those lighting the nave —the easternmost one in the south aisle wall —being provided with external plate tracery and with an internal replica of it, supported on a slender shaft, as indicated in the accompanying drawing of the interior of the church.

The design ends with an unfinished, though massive and stately, tower. Indeed, its very strength, unnecessarily great if this were all that was intended, alone goes to prove that the original design included another stage, and possibly a tower, which all this wealth of stone and buttress was built up to support. Restoration, in 1860, has taken away some of the interest, but the work was in good hands, those of the late Mr. G. E. Street. Some hideous modern glass lessens the beauty of the chancel, and should be removed. There are brasses in the church, of which the most interesting is that to John Lumbarde, rector, who died in 1408. His figure is encircled with the Credo.

These notes would be incomplete without further reference to Street's restoration of nearly forty years ago. Cresy's monograph on Stone Church is worth referring to, in order to compare the building as it is now with the appearance it presented then. Except for this archæological interest, Cresy is utterly useless and out of date. He has, for instance, a view of the chancel as it was before Street's restoration restored the vaulting. That view shows the flat plaster ceiling which had been there since the reparation of the church after the fire caused by lightning in 1638; and also shows the Perpendicular east window which Street removed and replaced with one of his own, designed exactly to match the original ones of the same character as this in the north and south walls of the chancel. It is essential for anyone writing at length on Stone Church for technical readers to have recourse to Street's own account of Stone and his work there. This may be found in "Archæologia Cantiana," Vol. 3, 1860. He gives a view of the exterior, with the addition of a shingled spire which he proposed, but which—happily, as I think—has not been carried out. The restoration was not, for lack of funds, carried to its logical conclusion, and forty years of neglect have since then wrought much havoc, the church being unhappily situated in a poor district and immediately adjoining a railway and a great number of lime and cement works.

THE CATHEDRALS OF GLOUCESTER AND BRISTOL.

By W. LEE CLARKE.

GLOUCESTER has always been a town of importance owing to its position on the banks of the Severn. It is one of the most interesting and historic of our cathedral towns. Its chief and most important building is the cathedral, once the Abbey Church of St. Peter. It stands a little distance back from one of the main thoroughfares of the town, and is, to a considerable extent, surrounded by houses. The close is by no means extensive, but many pretty peeps of the building are obtained from the green. To get a really good view of the cathedral one should climb to the tower of St. John's Church, from which the building is seen to best advantage. Nearly the whole of it dates from Norman and Perpendicular periods: in fact, the plan has undergone but little alteration since Norman times. Gloucester Cathedral abounds in individual features, one of the most interesting being the Lady Chapel. This is an independent building, and not a continuation of the cathedral. It is long and narrow, without aisles. On each side is a two-storeyed chapel, each containing some exquisite fan-tracery vaulting. Nearly all the wall space seems taken up by windows. This beautiful chapel was built between the years 1457 and 1499.

The east window of the choir is the largest painted window in England. The manner in which the exterior mouldings of this window (and also of the west window) are carried upwards so as to form a sort of gable is worthy of note. Another individual feature is the exquisite fan-vaulted cloister walk. It is certainly no exaggeration to say that these cloisters are the finest in England. They form a quadrangle, but are protected from the weather by rows of glazed windows. There are ten bays on each walk, with a window in each bay. In the north walk is the monks' lavatory, which takes up four bays. It is a well preserved piece of work. The most noteworthy feature of these cloisters is the fine fan-vaulted ceiling, it being the earliest example of this particular vaulting. As a rule, the cloisters are situated on the south side of a cathedral or abbey, but here they are on the north side of the building. Of all the external beauties, the tower is decidedly the most striking. It forms an admirable centre to the mass surrounding it. In general scheme it is not unlike Canterbury. Rising as it does at the intersection of the transepts with nave and choir, it is the chief feature of the massive pile. Its graceful traceried pinnacles and pierced parapets give it a peculiar charm. It is 225ft. high to the top of the pinnacles, and dates between 1450 and 1457.

The peal of bells are especially interesting from the fact of their age, and also because they escaped the clutches of the church wreckers at the time of the Dissolution. The cathedral suffered but little during the historic siege of Gloucester, but we are told that during the Commonwealth its destruction was intended and the wrecking of the little cloisters and Lady Chapel had been commenced, and had it not been for the exertions of the Town Clerk, the tower would certainly have perished, as all the necessary apparatus for its overthrow was in readiness.

Bristol has been rightly called "the City of Churches." Many of them are very ancient, some dating from the Norman Period, whilst one, St. Mary Redcliffe, is said to be one of the finest parish churches in England. Although the cathedral does not rank among our large English cathedrals, it is somewhat interesting in detail, and picturesque in appearance. The original building was the Church of the Monastery of St. Augustine, founded by Robert Fitzhardinge in 1142. Some parts of the old Norman building still remain.

The position of the cathedral is certainly not a good one. There is no close worth speaking of, it flanks the street on the north side, and there is a burial ground on the south; on the east is a narrow lane with houses overlooking the burial ground. There is a small grass plot at the west end, but no comprehensive view is obtained from it. Of the old church, the choir and transepts alone remain, the nave being added in 1877 by Street.

The aisles are equal in height to the nave and choir, there being no triforium or clerestory. The nave contains six bays, and is 120ft. long, 69ft. broad, and 60ft. high to the stone vaulted roof. The Elder Lady Chapel contains some good Early English work, and dates from 1196 to 1215. The east window dates from 1320, and is filled with some of the very best glass in England. It was cleaned and restored in 1847.

The Chapter House is of Norman design, and forms a parallelogram 42ft. by 25ft. It is preceded by a vestibule of Norman arches, round and pointed. The walls of the room are lined with circular arcades with intersecting arches, all of which are enriched with carving. The central tower is of Perpendicular work, and was practically rebuilt in 1894.

Adjoining the cloister (the north and west walks of which alone remain) are portions of the Bishop's Palace, which was destroyed by fire during the riots of 1831.

The Norman archway, a little to the west of the cathedral, was originally the approach to the abbot's lodgings, the superstructure being of modern times. Viewed from a distance, as illustrated by the sketch, the massive pile has a picturesque though by no means a graceful appearance. About £16,000 has been spent during the past seven years in restoring the cathedral.

DISPUTED POINTS UNDER THE LONDON BUILDING ACT.

By GEORGE H. BLAGROVE,

Certificated Surveyor under the Act; Author of "Dangerous Structures," "Shoring and its Application," &c.

(Continued from page 102, No. CCXLI.)

III.—PROJECTIONS.

PROJECTIONS from buildings are regulated under Section 73, which applies to all buildings, wherever situated, except when the contrary is expressly stated. A shop front may project in a "street or way," and a bay window, oriel window, or turret may project in a "street," while there are sundry restrictions as to projections over the "public way." In most cases there is no doubt as to whether a locality is a "street" or "way," or as to where the "public way" begins and ends. Occasionally, however, there is room for uncertainty, and it is clearly undesirable to form projections which may have to be removed because they cannot be sanctioned.

What is a Street?

The question, what is a street? was raised in the case of *Wood* v. *London County Council*, in which the decision of a magistrate was reversed on appeal. In this case a quadrangle, open to the sky, was intended to be enclosed with buildings on every side, and to be approached through a single archway, which would be closed by iron gates. The buildings were to contain forty-two flats, which were to be approached from two entrances and staircases leading from the quadrangle. The archway and quadrangle were stated to be for the use of the tenants in the flats "and the tradesmen and others visiting them on business and pleasure, with or without carriages." Now the definition of "street" under Section 5 (1) includes "any highway, and any road, bridge, lane, mews, footway, square, court, alley, passage, whether a thoroughfare or not, and a part of any such highway, road, bridge, lane, mews, footway, square, court, alley, or passage." The magistrate held that the quadrangle was a street within the meaning of this definition, and he convicted the appellant of having commenced to lay it out for carriage traffic without the sanction of the Council, contrary to Section 7. The Court held that the magistrate was wrong, and that the quadrangle was not a "street."

It appears that in all similar enclosures the provisions of Section 73 do not apply. A case came under my notice in which several blocks of buildings were grouped around a similar open space, which was only approachable through gateways, closed at night. Here the district surveyor allowed the main cornice to project more than 2ft. 6in. over what would have been the public way had the enclosure been a "street."

Projections Requiring the Consent of the Council.

The powers conferred upon the Council in respect of buildings or structures beyond the general line, are, under Section 171, applicable also to the local authority; and Section 73 (8) provides that the Council are to consult with the local authority before giving their consent to any projection beyond the general line, when such consent is required. Nevertheless, the sanction of a local authority is not sufficient in cases where the consent of the Council is required. This was proved when the proprietors of a public house at Hackney were summoned at the instance of the Council for causing the erection of a building beyond the general line. The defendants had a convenience at the rear of their premises, which was objected to by the licensing justices because it was approached through a club-room. The justices selected a spot in the back yard for the erection of a new convenience, which was approved by the vestry, and built accordingly. But as this new structure projected beyond the frontage line of an adjoining thoroughfare, the Council took proceedings, with the result that the defendants were convicted of an offence against the Act.

What is a Projection?

It is evident that some portions of a building may project without being "projections" within the meaning of the Act. Section 73, after defining the projections that are permissible, excludes all others, excepting "water pipes and their appurtenances, copings, string-courses, cornices, facias, window dressings, and other like architectural decorations." A porch or portico is a projection requiring the consent of the Council. But a doorway may have pilasters or engaged columns, supporting an entablature and a pediment; these would be architectural decorations. The columns, instead of being engaged, might be detached, thus projecting a little more; and it becomes difficult to see where the doorway ends and the porch begins. I have known some surveyors assign the limit of 18 inches for architectural decorations; but this seems quite arbitrary. I should be disposed to define an architectural decoration as something which can be either corbelled out or supported upon a set-off; if it requires a foundation, with footings, &c., it ought to rank as a projection. A safe rule in such cases would be—"when in doubt apply to the Council."

Bays, Oriels, and Turrets.

In Section 73—(5) and (6)—it is provided that bay windows, oriel windows, and turrets may be erected, subject to certain rules, in a street not less than 40ft. wide, or "to a building, the front wall of which is not at a less distance than 40ft. from the opposite boundary of the street." It is not expressly stated, but is evidently implied, that the projections specified are intended to be erected in advance of the front walls of buildings in a street; and no rules are furnished as to projections from rear walls or flank walls not facing any street. In (5) (*g*) and (6) (*e*) we read that bay windows, oriel windows, and turrets, "to which the foregoing rules do not apply," shall not be erected without the consent of the Council, after consulting the local authority. Here the language is certainly ambiguous. Had this exception been stated with respect to projections "which do not conform to the foregoing rules," there had been no room for doubt as to the meaning. As it is, the phrase "to which the foregoing rules do not apply" admits of a somewhat wide application. The rules do not apply to projections in the rear. Is it intended that these shall not be erected without the consent of the Council? I have never known such a view adopted by any district surveyor; on the contrary, I have known of bay windows erected in the rear exceeding in dimensions the limits defined under Section 73.

What is a Bay Window?

To understand what a bay window really is we must refer to Section 73 (5), where we read that bay windows to dwelling-houses may be erected "on land belonging to the owner of a building." This clearly implies that every bay window must have a foundation upon the solid earth. I knew a case in which it was proposed to build a bay window, corbelled out like an oriel, in the ground storey only of a dwelling-house, there being a basement and forecourt below. This could not have been allowed under the rules for oriels, no part of which may be less than 10ft. above the level of the street (6) (*b*); and the district surveyor treated the projection as a bay window, and required it to be supported upon columns with proper foundations.

No rules are prescribed for the construction of bay windows, and they are usually built with walls whose thicknesses are determined by Part I. of the First Schedule. This may perhaps be justified under Section 1 of the Preliminary part of the Schedule: "Every building, unless otherwise sanctioned in accordance with this Act, shall be enclosed with walls constructed of brick, stone, or other hard and incombustible substances." I have heard it contended that the walls of a bay window cannot be regarded as external walls within the meaning of the Act, because they are obviously not intended to be regulated by Section 54 (1) (*b*), which limits the proportional area of openings in external walls. As a matter of fact, they are generally built so as to be out of conformity with the last-quoted section. It is to be wished that the Act had been more explicit as to the construction of bay windows, or that there were some authoritative decision upon the question.

Oriel Windows and their Construction.

It may be observed that, under Section 73 (5) (*b*), bay windows are permissible provided that they "do not project more than three feet from the main wall of the building to which they are attached." The presumption is that bay windows may have cornices and stringcourses projecting beyond the limit of 3ft. But in the case of oriel windows the phraseology of the Act is different. These are permissible provided that (6) (*a*) "No part of any such projection extend more than three feet from the face of the front wall of the building." Here the words, "No part of any such projection," may be taken to mean that cornices and stringcourses must be kept within the limit of 3ft. There would thus be a fundamental distinction, as regards the amount of projection, between bays and oriels, because the former rest upon foundations and the latter are corbelled out. But I am aware that the opinions of surveyors are not unanimous upon this point.

There is nothing in sub-section 6 to regulate the construction of oriel windows. On the contrary, it is expressly provided that (*e*) "every such projection be constructed to the satisfaction of the district surveyor, or, in the event of disagreement, to the satisfaction of the superintending architect, whose determination shall be final." A case came under my notice in which an architect designed an oriel window of wood, hoping that its construction would be "to the satisfaction of the district surveyor." The district surveyor, however, objected to it, not on the ground that it was not to his satisfaction, but that he had no power to sanction it; and he based his contention upon Section 55, which provides in effect that no woodwork (except shop fronts) may project beyond the external face of a wall. An application was then made to the Council, who sanctioned the construction of the oriel on condition that it was of "oak, teak, or other hard wood." This was in accordance with the last paragraph of Section 55, which provides that the Council may, "by bye-laws or otherwise," exempt from the provisions of the section oak, teak, or other wood, "provided the work be constructed to the satisfaction of the district surveyor."

The conclusion to be drawn from this case is that the district surveyor was right in his contention, otherwise the Council would have held that the application was unnecessary, and would have refused to entertain it. It is evident, also, that the stonework or brickwork of an oriel must be an external wall within the meaning of the Act, otherwise the oriel could not contain any woodwork beyond the external face of the main building.

Trade Signs.

With the exception of Part XII., relating to sky signs, there appears to be no provision in the Act expressly dealing with trade signs as such. Much ingenuity is expended in devising new sorts of signs, and some of these, when permanently fixed to the walls of buildings and projecting over the public way, would appear to come within Section 73. There is, for example, an illuminated sign, semi-elliptical upon plan, frequently fixed so as to project over the entrance of a public house. Architects, as a rule, are accustomed to regard such signs as rather detrimental than otherwise to architectural effect, and some of them would possibly not be sorry if the erection of some trade signs were prohibited. But such matters are of vital importance to tradesmen, and it is to be wished that some definite regulations were laid down in regard to them.

(To be continued.)

Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor.

BACK NUMBERS OF THE BUILDERS' JOURNAL.

In reply to NEW SUBSCRIBER (Hamilton, N.B.), the present volume began with number CCXXXV., dated August 2nd; back numbers of these can be had, price 1d. each.

W. B. (Croydon) can obtain the numbers for February 1st, 8th, 15th, and 22nd, and for March 1st, 15th and 22nd at this office, price 1d. each (post free 1½d.)

A BOOK ON PERSPECTIVE.

To the Editor of THE BUILDERS' JOURNAL.

KEIGHLEY.

SIR,—Will you please tell me through the medium of your valuable paper which is the best book to be got on architect's (direct method) perspective. Please let me know the name of publisher and price of the best book. Thanking you in anticipation of an early answer.—Yours, &c., F. L. S.

We advise you to get Mr. G. A. T. Middleton's book on "Linear Perspective," published by B. T. Batsford, of 94, High Holborn, London, W.C.; price 1s.

BOOKS ON DRAINAGE.

To the Editor of THE BUILDERS' JOURNAL.

ISLE OF MAN.

SIR,—Will you kindly give me the names and publishers of works by reliable authorities dealing with the drainage of small towns and villages built in an uneven and hilly country, and oblige, yours truly, NEMO.

The following books are recommended:—"Drainage of Lands, Towns, and Buildings," by G. D. Dempsey, C.E., with additions on "Recent Practice in Drainage Engineering," by D. Kinnear Clark, M.I.C.E. (post free 3s. 9d. nett); "Sanitary Work in the Smaller Towns and in Villages," by Charles Slagg, Assoc. M.I.C.E. (post free 2s. 6d. nett); "Sanitary Engineering," by Colonel E. C. S. Moore, R.E, M.S.I. (30s. nett), all obtainable from B. T. Batsford, 94, High Holborn, W.C.

"RICKMAN'S GOTHIC ARCHITECTURE."

To the Editor of THE BUILDERS' JOURNAL.

LONDONDERRY.

SIR,—Can you tell me whether "Rickman's Gothic Architecture" is now only to be obtained on secondhand bookstalls, and by similar chance, or can I obtain it through a publisher? I have already made inquiries locally, but have not been able to obtain information.—Yours truly, H. E.

"Rickman's Gothic Architecture" is out of print, and is scarce. The best edition would cost about 22s. Mr. Bloxam's book on the "Principles of Gothic Ecclesiastical Architecture" (two vols., post free, 12s.) would be the best substitute. "English Church Architecture," by George Gilbert Scott, F.S.A., should be useful to you. Its price is 26s. Both works are published by B. T. Batsford, 94, High Holborn, W.C.

BOOKS FOR STUDENTS OF ARCHITECTURE.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Would you kindly advise me as to what books would be most serviceable to me in preparing myself for the examination in architecture (South Kensington)?—Yours truly, J. B.

We would suggest Hamlin's "History of Architecture," Spiers' "Orders," Glazier's "Historic Ornament," Parker's "Glossary of Architectural Terms" (small edition), and Anderson's "Italian Renaissance," combined with ample study, preferably by making measured drawings in pencil on the spot, of English Gothic work. All these can be obtained from B. T. Batsford, 94, High Holborn, W.C., possibly secondhand in some cases.

G. A. T. M.

ANCIENT LIGHTS.

To the Editor of THE BUILDERS' JOURNAL.

HYTHE, KENT.

SIR,—I shall be glad to receive an answer to the following questions: I am about to secure a piece of ground which has one window overlooking it, which has been built about six years. Shall I have to allow the owner of this building ancient lights, or shall I have to allow him in any way for the same? I should also like to know how long a house has to be built to claim ancient lights?—Yours, &c. H. O.

Six years does not constitute a right of light. The term to obtain a right of light is twenty years, provided no obstruction has taken place for one year after the party interrupted shall have had, or shall have, notice thereof. It follows that if uninterrupted light has been had for nineteen years and one day, the right of light is obtained, seeing that a twelvemonths interruption cannot be made in the remaining time to complete the twenty years. This right of light can, however, be foregone by consent or agreement expressly made, and it is the wisest course to pursue to try and obtain such an agreement, which will avoid the expense of erecting a hoarding to keep out the light. The adjoining party will probably not mind doing this, for it would not avail him anything to oppose; the only pleasure he might get being to cause extra expense.

TENANT'S LIABILITY FOR DILAPIDATIONS.

To the Editor of THE BUILDERS' JOURNAL.

EAST TWICKENHAM.

DEAR SIR,—I should be very much obliged if you would tell me through the columns of your valuable paper the proper methods to pursue with regard to the service of a schedule of dilapidations on an outgoing tenant. Also the form such schedule should take, and whether any clause should be inserted relative to referring the matter to arbitration.—Yours faithfully, SURVEYOR.

The lease on which the premises are held should be carefully read. Probably it contains a clause permitting entry for the purpose of measurement. The schedule should then be prepared much in the form of a bill of quantities, only instead of division being by trades it should be by rooms, only such items being inserted as are clearly dilapidations according to the lease, fair wear and tear being always excepted, and particular attention being paid to such small matters as lost keys and broken sash fasteners. No mention should be made of arbitration unless the bill be objected to by the tenant, in which case he should be asked to appoint a surveyor to go into the bill, the two surveyors meeting and signing a fair award, or referring the matters in dispute to a third surveyor. It would be well to read Stevenson's book on the "Measurement of Dilapidations" (Batsford).

Correspondence.

A QUESTION OF CULT.

In our issue for September 20th, on page 108, appears a perspective view and plan of some houses to be erected at Claygate in Surrey. In reference to these illustrations we have received some interesting and somewhat amusing correspondence. We are always pleased to publish good humoured criticism on matter appearing in our columns, especially when—as in the present instance—the subject is one of general interest to the architectural profession. The author of the drawing is invited to reply, and we shall be glad to have the opinions of other readers on the subject. The following trenchant letter by a well known architect seems to show that the cult of Aubrey Beardsley does not altogether commend itself to architectural draughtsmen :—

A Bolt from the Blue.

To the Editor of The Builders' Journal.

London, S.E.

Sir,—Your interesting paper is delivered to me, with other weekly publications, usually upon a Saturday. That arrangement enables one to give more time to study its contents. In doing so this week I was much amused by one of the illustrations in your issue of Sept. 20. It is supposed to represent some houses at Claygate, Surrey, and seldom have I ever enjoyed so good a laugh as that evoked by this illustration.

Apart from the "design" of the houses, which—well, one can hardly call a "striking" one, did ever any human being, much less an artist, ever see such surroundings? Examine the clouds, they are evidently modelled from that palatable vegetable the kidney bean, and if kidney beans could be grown in proportion to the size of the houses, the producer of these in this picture would soon make a fortune.

I should imagine that the "producer" of this view (I think this is the best term to use for him) must be a vegetarian, for look at his fearful and wonderful trees, they are evidently drawn from some illustration of a cocoa pod just bursting with seed, while gigantic crocus lie prostrate in the road, and the poor sheep are trying to make a meal off the bare stones, thus evincing the "producer's" hatred of mutton.

The little toy windmill, in the view, on the top of a mountain, and the little house on the right-hand side of it, whose eaves are built at the same angle as the mountain side, is "so like Surrey, you know." And as to the sign-post in the left-hand front of the view—well, there is a good deal of "post" in it, but, puzzle, "find the sign."

To finish this masterpiece, look at the stout lady dressed in the costume of the period of the late George Morland, who, by the bye, only painted coarse women and coarse pigs. This lady should not, evidently, be entrusted with the care of an infant (as shown), for she would certainly come to grief if she advanced a step further into that pond of water lilies to which she appears to be rushing to her fate; she is apparently making a "bolt from the blue" of the kidney bean sky.

Surely, if to be eccentric is to be famous, hen the "producer" of this view has sueeded in obtaining some sort of notoriety. I hould presume he belongs to some "cult" or ther; but, then, alas! great criminals are ften more notorious than great statesmen.

It is quite refreshing, after these wretched cult" productions—these Aubrey Beardsley anities—to look again at the splendid archiectural illustrations, many of them sunny ictures, that have been published from time time during the last thirty years from the ilful pencils of such men as A. H. Haig, Deshon, the gifted but unfortunate H. A. Fribble, and that prince of architectural delineators and clever artist, James Langham. If some of the present sickly "cultists" would study these men's work a little, it would, I am sure, do them good and brace them up a bit, even if it could not make them strong men. And again, if they want to see what trees and skies really should look like in pictures, let them study the grand works of Arran Penley's on water-colour painting.

I feel that some stand should be taken against such grossly perverse views of beautiful Nature, and this must be my apology for trespassing so much on your valuable space. H. T. B.

Nor is it only with respect to the drawing of the perspective that our readers have exercised their critical faculties upon this design. Here is a letter from a correspondent who finds the plan also open to grave objection :—

An Amended Plan.

To the Editor of The Builders' Journal.

Bishop's Stortford, Herts.

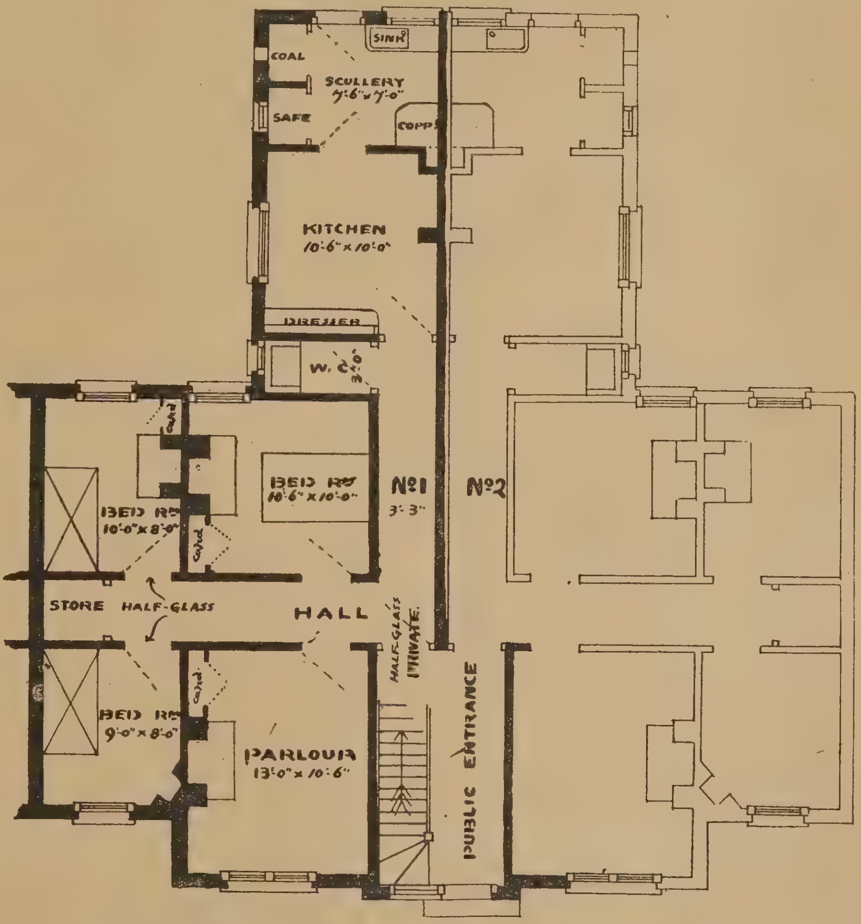
Sir,—I am afraid that the houses proposed to be erected at Claygate, in Surrey, as self-contained dwellings, will not be a commercial success.

Where will the twenty or more families be found to occupy them that are not hampered, say, with three or four children; are they to be crowded into the one bedroom, as shown on plan, page 108, No. CCXLI.? What would the medical officer of health say to this?

My experience of cottages and houses for the working class is that two bedrooms is not sufficient, and if three can be given, for the sake of decency let each be private.

I inclose you an amended plan of the one on page 108. By reducing the size of parlour and bedroom, and a slight increase in the frontage, a very convenient block is obtained, which, with the broken front, would give the elevation a much better effect.

ALFRED BRETT.



SUGGESTED PLAN FOR WORKMENS' COTTAGES. A. BRETT, ARCHITECT.

Another correspondent founds upon this drawing the following interesting reflections on the tendencies towards eccentricity manifested by present-day draughtsmen :—

Eccentric Architecture.

To the Editor of The Builders' Journal.

Brixton Hill, S.W.

Sir,—May I be permitted to call attention to the tendency among exponents of the modern school of architectural draughtsmanship to affect the "eccentric" in their productions? Some of the perspectives recently published in your journal show very plainly the extreme lengths to which such draughtsmen can proceed when their imaginations are given full play. Take, for instance, the latest method of drawing a shrub or bush as an architectural accessory. On examination it will be found to consist of very carefully drawn leaves and berries to a huge scale inclosed in a net or bag of some transparent material. If the gauze envelope be removed, we have remaining an admirable botanical study no doubt, but that such a feature is in any sense appropriate to an architectural perspective, few people, I imagine, would have the temerity to maintain. Similar absurdities, doubtless considered "original" and "clever" by those unthinking individuals who can always be relied on to worship the unintelligible, are to be detected in this class of drawing. Surely those to whom consistency in matters appertaining to art is of the first importance have a right to offer a protest against the introduction of these crude perversions.

The climax is reached, however, by the author of the houses at Claygate, a "perspective" of which appeared in your issue for September 20th. The subtle conception of sheep kicking the dust off their hind feet into little bags tied to their hoofs is of the highest order, and, apart from its value to rural surveyors as a suggestion for an economy in road cleansing, throws a new light on the intelligence of a hitherto neglected performing animal.

The same drawing shows us how a "clever" sky effect may be produced by trailing skeins of unravelled thread diagonally across the picture, and attaching to their ends a few inflated sacks. The result is positively realistic, and only needs the potato salesman's name stencilled here and there to be exactly what an up-to-date Arts and Crafts sky should be. Equally hideous and fantastic are the crops of rissoles sprouting up amidst the boulders with which stray patches of the road are paved. The drawing is full of such oddities, and one is tempted to infer by their presence that the author of the design was a little afraid of the reception which might be accorded his simple and altogether satisfactory treatment of the elevations without such aids or "distractions."—Yours faithfully,

FREDERICK CHATTERTON, A.R.I.B.A.

GYPSUM.

To the Editor of The Builders' Journal.

Exeter.

Sir,—Under this heading, in No. CCXLI., page 103, "Student" asks: "Is gypsum used for any other purposes besides making plaster of Paris?" And this query has produced the very remarkable answer: "Gypsum is used by brewers in some districts to soften the water used for making beer. A coarse kind of gypsum is also used as a fertiliser in districts where the raw material is cheap." Gypsum, as everyone knows, is alabaster, and has been largely used in this country for the internal beautification of churches and large buildings ever since the time of the Norman Conquest, and probably long before. The old alabaster used within Westminster Abbey was quarried at Chellaston, near Derby, in the eleventh century, and I have had admirable blocks from the same place myself in recent times. The best comes from Derbyshire and Staffordshire. Blocks can be obtained of almost any size—certainly up to 26ft. long. Italian alabaster runs very much smaller—2ft. by 2ft. is a goodly size—and these foreign blocks are always misshapen, and hence wasteful in use. White Italian alabaster, however, is purer in its colour than is anything to be obtained in England. Most of our native alabaster is richly veined. The white variety is rare. The largest block of English white I ever had was just over 6ft., widest measurement. I have had blocks of grey alabaster from Luxemburg, Germany, of medium size (4ft. by 6ft., and thereabouts), but this variety seems to be more used in Belgium than in this country. Somersetshire alabaster is not worth speaking about. I quarried some at Blue Anchor, on the north coast of that county, in 1876, at the suggestion of the late Mr. G. E. Street, R.A., and used it largely in the restoration of the Mohun Chapel at the east end of Dunster Church, the renovation of which we had in hand at the time, but I have never cared to obtain alabaster from the same neighbourhood again, as it is not good enough for architectural or sculptural purposes. — Yours obediently,

HARRY HEMS.

IS OUR PRESENT SYSTEM OF EXAMINATION A FAILURE?

To the Editor of The Builders' Journal.

Harpenden.

Dear Sir,—I quite agree with your correspondent, Mr. Gloyn, that nervousness is a great drawback, but so are many other physical weaknesses, and they must be regarded in the same way. There are cases where nothing can be done to strengthen the nervous; but this is the exception, not the rule (the same with any other weakness). The system of examination must meet the requirements of the rule, not exceptions.

Furthermore, a very nervous man is not generally the one best suited for any particular post, though he may be the cleverest. This is especially the case with the Architectural profession and other occupations connected with the building trade. If a man is so nervous when he is before an examiner, what will he be should he be in the Law Courts? Little can now be done without an occasional dispute.

Some students will, no doubt, always resort to cramming, but this, I think, is minimised when a series of examinations is adopted, this insuring to some extent a course of study. The fact that similar questions are asked from year to year simply shows that the same course of study should always be followed. The questions asked at an examination cannot be arranged to suit the requirements of any particular class of students. It is, therefore, better to ask too much than too little, and so meet the requirements of all. What may apply to one examination may not apply to others. It is, therefore, difficult to discuss the system of examination in general.—Yours, &c.,

A. H. S.

MODEL ANSWERS TO EXAMINATION QUESTIONS.

Answers to Questions set in the Examination held by the Society of Architects in April, 1899.

By G. A. T. MIDDLETON and R. W. CARDEN, Associates R.I.B.A.

(Continued from page 105, No. CCXLI.)

IV.—CONSTRUCTION.

(Part I.)

1. *A church has to be built on light soil, and there is some doubt whether detached foundations for the columns would be sufficient. The columns being of Mansfield stone, 2ft. diameter and 16ft. from centre to centre, show what foundations you would recommend. Scale ½in. to 1ft.*

The nature of the soil is not sufficiently described for the question to be properly answered, nor is the source from which failure is to be apprehended indicated (whether lateral sliding, vertical settlement, &c.). If the soil were of a "pea-soup" consistency, as that near the docks in the East End of London, pile driving might be necessary, or a concrete raft over the whole site with metal joists embedded therein to stiffen it; or, if the soil were rather more solid, making the concrete continuous from one column to the next might suffice. Again, in the case of lateral movements it might be imperative to put inverted arches between the bases of the columns. The foundations as shown (see illustrations) should be sufficient for a detached column on any soil about whose bearing power there is only "some doubt."

2. *A trench, 4ft. wide and 10ft deep, has to be made in average soil. Give sketch of the timbering that should be employed, with figured scantlings. State what difference would be made if the soil were a running sand.*

The boarding (see illustrations) is shown 3in. apart. In a firmer soil the boards might be further apart still. For sand they would be placed close together, and, for very fine sand, the joints caulked roughly. The straining poles are cut rather longer than the space they have to span, and are forced into position so as to remain rigid. This being a "two-throw" excavation, the intermediate staging would rest upon the middle row of straining poles.

3. *Show how the thickness of a brick wall is determined, say for a warehouse, 40ft. frontage, with five floors above ground level and a basement, the heights from floor to floor being 10ft.*

Under the Model Bye-laws this is a building of the warehouse class, 70ft. high and less than 45ft. length, so that the base of the wall must be 22in., or 2½ bricks thick. Also, the uppermost 10ft. must not be less than 13½in. or 1½ bricks (the rule as to no storey having walls less than $\frac{1}{16}$ of the height in thickness does not apply), so that the wall may be as shown:—20ft. at 22in., 30ft. at 18in., and 20ft. at 13½in. There is no empirical rule.

4. *Give sketches to illustrate the following:—Hoop-iron bond, hollow wall ties, herring-bone bond, garden wall bond. How is the thickness of a concrete foundation determined?*

(The following slight notes would really in the examination be added on the sketches.)

Hoop-iron Bond (see illustrations).—There should be two for about each 1½ brick in thickness of wall, and they should be built into every fourth course. To be tarred and sanded. 1in. to 1½in by $\frac{1}{16}$in.

Hollow Wall Ties.—3ft. apart in every fourth course.

Herring-bone Bond.—Not suitable for walls less than three bricks thick, and is rarely used.

Garden Wall Bond.—Used in 9in. walls so as to obtain a fair face both sides, as, with three courses of stretchers to one of headers, only the bricks for heading course need be picked of the same size, the others being brought up fair by regulating the joint in the centre.

The simplest method of arriving at the requisite depth of concrete is that shown—drawing lines at 45deg. to the horizon from the top of footings until they meet perpendiculars dropped from the furthest projection of the base; these points of intersection give the required depth.

5. *The roof of a billiard-room, 30ft. by 20ft., is formed of rolled joists carrying a lead flat, with a lantern light in the centre, 14ft. by 7ft.; give vertical section through one side of lantern, showing connection with roof. Scale 1in. to 1ft.*

(We have assumed a 14in. by 9in. steel joist at each end of the lantern, and shown cross girders from these to frame the opening. The illustration to this question is double the scale of all the others shown on the page.)

(To be continued.)

BUILDING TRADE LEGENDS.

Most persons have heard of the legend associated with the erection of cathedral and other edifices devoted to ecclesiastical purposes, that the Powers of Darkness always claim one human life as a sacrifice during the process of building, and there is hardly a cathedral or minster in the world which has not some such sinister legend associated with it. At Shottesbrooke, in Berkshire, the story runs that when the capstone was being fixed on the spire the architect called for wine to drink the health of the king, and that after drinking it he fell down and was killed. A coffin-shaped stone in the churchyard, bearing the letters "O! O!" his exclamation as he fell, is stated to denote the spot where he lies buried. The legend of St. Francis of Assissi, who rescued a poor mason from falling, and that associated with Sir James Thornhill's painting in the dome of St. Paul's are too well-known to need recapitulating.

Some of the legends handed down have reference to disputes among the workpeople. Thus, the church at Minchinhampton, Gloucestershire, is stated to have a portion of its roof formed of old gravestones, because there was a strike among the carpenters, and the woodwork in consequence could not be finished. Chesterfield Church is said to owe its distorted spire to the perversity of the builder, who built the church without adding a spire. Being compelled to finish the work, he constructed the spire in such a way that it has remained a curiosity ever since.

History gives us many legends of persons who, after being engaged in the construction of secret chambers, have been put to death to prevent their divulging the secret, while at other times it was the architect who was so treated to prevent him setting up any other building equally beautiful. Thus in the Church of Gouda, between Utrecht and Amsterdam, there is a beautiful window of stained glass, the tradition concerning which is that on its completion the artist's eyes were put out for fear any other church should have a window so grand.

ILLUSTRATIONS TO ANSWERS TO EXAMINATION QUESTIONS 1 TO 5.

Bricks and Mortar.

Aphorism for the Week.

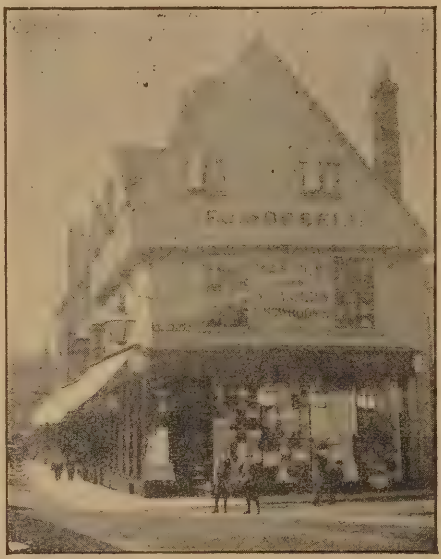
"Das einfach Schöne soll der Kenner schätzen;
Verziertes aber spricht der Menge zu."
—Goethe.

Lych Gate at Dovercourt. The lych gate erected by the Queen at Dovercourt Parish Church has been opened. The church has been thoroughly restored, and stained glass has been placed in every window except two. One of these is to be erected by the German Emperor, in memory of some men of the German Legion who died at Dovercourt after the Walcheren expedition, and were buried in the churchyard. The Queen's lych gate is to the memory of British soldiers. It is built of carved English oak, and is very massive. Messrs J. E. K. and J. P. Cutts, of London, are the designers, and Mr Edward Saunders, of Dovercourt, is the executor of the work. It bears the following inscription: "Erected by Her Majesty Queen Victoria, Empress of India, to the memory of British soldiers buried in this churchyard, particularly those who died from disease contracted during the Walcheren Expedition, 1809—1810." These words surround the Imperial Crown, and on the reverse side of the gate is the Royal coat of arms. Upon the cross in the front is also carved, "Blessed are the dead which die in the Lord," and "A.D. 1899."

Old Vauxhall Bridge. The demolition of Old Vauxhall Bridge is now completed almost to the water level. While at work on the abutment on the Westminster side Messrs. Pethick, the contractors for the work, came upon the foundation-stone. In the stone was a pocket containing a glass case. Inside this was a solid slab of silver, measuring 8in. by 5¼in. and weighing just 3lb.. on which the promoters of the bridge had inscribed their record. John Rennie, the architect of the bridge, also carried out Waterloo Bridge at a cost of nearly £1,000,000, against £259,681 spent on Vauxhall. The old Vauxhall Bridge was the first iron bridge built over the Thames, and Sir A. Binnie's design which is to replace it will be the first concrete bridge over the river. The old bridge has been found by Messrs. Pethick to have been most solidly and enduringly built. The overhead cable trucks have proved of the greatest service in removing material, and the contractors, who have also to reconstruct up to the springing line, contemplate using a double set of cables for the work of erection. Before the superstructure comes to be built it is to be hoped that the London County Council will allow architects some voice in altering the design regarding which so much dissatisfaction has been expressed.

Reconstruction of Thetford Town Hall. The work of reconstruction of the Thetford Town Hall revealed that the foundations of the County Court were so bad that it was necessary to take out the soft soil upon which it had been built and lay in a solid concrete bottom. At one of the corners of the building a concrete column has been sunk to a depth of 23ft. and steel girders have been laid. When the walls and floors of the large court and council chamber were cleared of plaster, it was found that the joists and timbers of the floor and the bond timbers were very much gone. In some cases the oak beams are to a great extent gone to powder. The walls appear to have been built of any material that came to hand—old chalk, tiles, brick on edge, and bond timbers—and are loose and cracked in all directions. In fact, there is very little sound work in the whole building, and it is quite clear that the jerry builder was known in the seventeenth century as well as at the present time. Several members of the committee charged with the work of reconstruction met the architect and clerk of the works, and made a very careful and minute inspection. After hearing the report of the architect, Mr. Green, it was unanimously resolved to take down the great court walls to the ground level. Mr. Green was instructed to go through his plans and see what modifications could be made consequent upon this decision. In the course of pulling down and removing two closets at the top of the first flight of stairs and at the rear of the big chimney, there was found, very many feet below, a large cesspool, and just above, on a piece of plaster work, was the inscription "G. B., January 31, 1800," these being the initials of George Burrell, a son of George Bird Burrell, a distinguished townsman and antiquarian of that period.

A Threatened Beauty Spot. On this page we give a picturesque view in the market place of St. Albans. This view is threatened to be marred by the alteration of the present shop in the centre. The block of tenements, of which this particular house forms the northern extremity, is rightly considered as the most picturesque relic of mediæval St. Albans, and the old plaster gable, with its overhanging upper story fronting the Market Place and St. Peter's Street, imparts to this portion of the town a character at once so quaint and beautiful that its destruction would prove most lamentable from an artistic and archæological standpoint. The building bears date 1637, but is probably earlier than that date. On the right of our illustration is French Row, with the gables and high-pitched roofs of the "Old Christopher"; in the centre the Clock Tower rises above chimneys and dormers; while dominating these is the grand old Norman tower of the Abbey Church. On Saturdays, the pictorial effect is enhanced by the ever-moving crowds of market people, and by the primitive hooded stalls laden with merchandise. A petition, signed by, amongst others, the Lord Bishop of St. Albans, Sir Arthur W. Blomfield, and the Mayor of St. Albans, has been sent to Messrs. Boots and Co. Limited, wholesale chemists, of Nottingham, who have bought the premises. The petition expresses the hope that in carrying out the alterations the firm will endeavour to preserve the characteristic features of the building, especially the north and east fronts, as they now exist. The managing director of the firm has replied courteously, promising to meet the petition if possible.



OLD ST. ALBANS: HOUSES THREATENED WITH DEMOLITION.

Preserving Ancient Monuments. It is to be hoped that the bill introduced in the House of Commons last session, "to amend the Ancient Monuments Protection Acts," will be passed without delay, for the above incident provides an instance of the need of such a measure. The object of the Bill is to empower the Council of any administrative county, if they think fit, "to purchase by agreement any monument (by which is meant any ancient or mediæval structure, or remains thereof) situate in such county or in any adjacent county," the same Council consenting, at the request of the owner, to become the guardians of any such monument, and undertaking or contributing towards "the cost of preserving, maintaining, and managing any such monument, whether they have purchased the same or become the guardians thereof or not." Another clause provides that "a monument of which the Commissioners of Works or any County Council have been constituted guardians shall not be assessed or rated to any county, or borough, or parochial, or other local rate or cess, or to income tax, or any other Imperial tax, and no such monument shall be chargeable with estate duty or any other duty, leviable on or with reference to death."

In Need of Preservation. The whole of the Monmouthshire estates of the Beaufort family have been in the market for private sale since last year. The property is only 26,000 acres in extent, but is remarkable for the large number of historic ruins it contains. It lies in a district of singular beauty, in that half of the country which is bounded by the Usk, the Wye, the Severn, and the Monnow. Perhaps its best known feature is the remains of Tintern Abbey, but besides this the estate embraces nearly every old castle of repute in the shire, which, being a border county, is rich in remains of early British stonework, Norman keep, and fortified Tudor hall. Tintern Abbey remains unsold, although several attempts have been made to secure it for the public. Usk Castle, said to date from Roman or Roman-British times, was sold by auction this last spring. The castle is mainly feudal in character, and still survives in its walls and towers, its inner keep, and in the more or less distinctly indicated baronial hall, and other living apartments. It has fortunately passed into private hands, from whom appropriate treatment may be expected. Within an easy ride of Usk is Monmouth Castle. The remains of the old Saxon fortress are now principally to be found in the cellars and foundations of the houses of Monmouth, the present building dating mainly from the time when the Dukes of Lancaster made it their seat. Further up the valley of the Monnow are the castles of Skenfrith and Grosmont, while at an angle with these on the road to Abergavenny is White Castle, by the village of Llandeilo. The Castles of Chepstow and Raglan are better known but have a comparatively modern history. Chepstow Castle will be offered for sale to-morrow. Near Raglan is Troy House, the work of Inigo Jones. The sale of these remains seems like the dispersion of a celebrated library or picture gallery, but there is the difference that there is a certain organisation to which the tax-payer makes direct contribution for the acquisition of rare books and noted works of art. A beautiful historic ruin is of interest to thousands of persons, whereas a rare manuscript interests but few; yet the National Trust, formed but recently, is the only organisation for the preserving of such relics, and this is purely voluntary.

The New Cathedral. London is the place of great undertakings. Reference has already been made in these columns to the new Roman Catholic Cathedral in course of erection at Westminster; but now that it has been carried roof-high, the general body of the structure and the character and size of the building can be viewed from the streets surrounding the site. When it is completed this huge Byzantine Cathedral will become one of the sights of the metropolis, and will no doubt be given a prominent place in the guide books, enabling ravaging sightseers to rush in and repeat book-read opinions about the building in the same way as Mark Twain's pilgrims. Cathedral building is always a slow process, and it is impossible to say exactly when this one will be completely finished; but it is anticipated that it may be opened for worship on September 29th, 1900—the golden jubilee of the Roman Catholic Hierarchy in England. The roofing has been begun, and will probably be completed by the end of the year; some of the minarets and domes are almost finished; and the lofty tower, which will form a striking feature of the building, has been carried to about half the intended height. The nave is the largest in England, having an area of 14,040 square feet, as compared with the 13,244 square feet of York Minster. During the recent Greco-Turkish war some exquisite Grecian marble columns were seized in Thessaly by the Turks; these have been brought over, and will be used for dividing the nave from some of the chapels of the new cathedral.

A Big Scheme. The vice-president of the import section of the Cardiff Chamber of Commerce (Mr. J. Kyte Collett) comes forward with an improvement scheme on a very liberal scale, so liberal, in fact, that it is considered to be impracticable for the present. Here are the chief features of it:—(1) The making of an underground self-working double canal from the West Bute Dock to the Crown Patent Fuel Works; (2) the levelling up of the supplanted canal for thoroughfares and building sites; (3) the widening of the river Taff, and the formation of an embankment on its west side; (4) the building of a western sewer on a system to combine the services of a sewer gas consumer, a refuse destructor, and an electricity generator; and (5) the opening up of the Leckwith Moors for manufactories. Mr. Collett claims that by this plan Llandaff, Penarth, and Cardiff would be brought nearer to each other, with the idea of forming one large city. A Napoleon may re-organise a continent, and Mr. Collett may propose gigantic improvements, but, unfortunately, all these things require an immense amount of money, and as the town of Cardiff is already committed to several costly schemes, this new one will, we fear, be received with much head-shaking when those in authority see the number of figures at the bottom of the estimate.

Prospective Fire Tests. The arrangements of the British Fire Prevention Committee for the winter session will again include a comprehensive series of fire tests, to which it has also been decided to invite distinguished guests from abroad, the almost international interest accorded to the work having led to a number of applications from foreign officials, architects, and engineers to attend the experiments. In October there will be further investigations with doors of various materials, with floors, patented partitions, and non-flammable materials. The operations of the testing station will then probably be extended to experiment with automatic fire alarms. An entrance fee will be shortly instituted, in addition to the annual one guinea subscription. Membership will henceforth also give the right to copies of of the reports of the testing station beyond the ordinary publication of the committee. Special arrangements have been made by which local authorities can take up membership if represented by an individual member or official, and several local authorities have already availed themselves of this facility. Mr. Geo. E. Monckton has again resumed his duties as secretary to the committee, which he had to relinquish in February last owing to ill-health.

St. Leonard's Church, St. Andrews. The ruin of St. Leonard's Church is claimed by the heritors to be a repairable church. The church consisted of a nave 86ft. long by 20ft. 7in. wide internally, a western tower standing on ground about 25ft. 6in. by 15ft. all over, a sacristy about 24ft. by 9ft. 6in. internally, and possibly a small south transept or porch, which could not have exceeded 12ft. in size from east to west. The existing structure measures internally 80ft. by 20ft. 7in. The church had the roof taken off about the year 1763, and has remained in that state ever since. At the same time all the interior woodwork was removed. The tower of the building was demolished in the latter part of last century by Principal Watson. In 1840 Sir David Brewster was permitted to take possession of 9ft. of the west end of the church, agreeing to restore the space if ever the church was rebuilt. Part of the north and south walls was also taken down by him, by which operations the nave of the church was shortened by, it is thought, 6ft.

The Sacristy. The church possessed a sacristy or session house, an old building in the shape of a "tofall," against the north wall. It communicated by a door through the wall, now built up, on the session house side. It is this sacristy that the heritors' agent (Mr. J. Ritchie Welch) stated to the sheriff recently that the heritors were willing to acquire. The University Court have agreed to contribute £1,000 towards the restoring the old church. If it is decided that a church must be built elsewhere than on the site of the old one, the heritors will lose the benefit of this sum, besides being forced to build an entirely new church at a cost of between £4,000 and £5,000, whereas the cost of repairing the old church, according to Mr. Ritchie Welch, would only be about £1,400.

Statue of the Duc d'Aumale. The equestrian statue by M. Gerôme of the Duc d'Aumale has been completely cast in bronze, and has been conveyed to Chantilly, where it will be erected at once, and unveiled in about a week's time. The Duke, in full uniform, is saluting with outstretched arm, hat in hand. The figure is rendered with extreme finish of detail, but at the same time with great breadth and simplicity. The charger is a fine piece of sculpture, and the animal, which has been brought to an abrupt halt, is wonderfully natural. The statue, the bronze material of which has been finely gilt, will be erected in the Park of Chantilly. The artist has plainly striven to give the impression of life and motion in the figure of the soldier, and in the charger which he is riding.

Prodigious! In many parts of New York there are what might be called forests of lofty structures; but a building has just been raised which must surely overtop all the others. It is the Park Row Syndicate building to which we refer. This building is somewhat irregular in plan, having a frontage of 104ft. on Park Row, and extending backward a distance of 178ft. Buildings of twenty storeys spring up like mushrooms in New York, but this one runs up to twenty-six storeys from the ground level to the main roof, five storeys in each of two towers at each side, and one storey in each dome. In addition there are a tenement and sub-cellar below ground, making a total of thirty-four storeys in all. The height of the building is 424ft. Pile foundations are used throughout, and the total weight of the building is estimated to be about 65,000 tons.

Model Flats. A French syndicate has been formed to construct model flats in New York that will be leased at a price within the means of working men. All the plans have not yet been drawn, but to some extent ideas will be followed which are introduced in the model tenements now almost constructed in the Broux with money invested by the Baroness de Hirsch. In the de Hirsch apartments the suites of rooms vary from three to six, and the rental has been fixed at from 6dols. to 15dols. a month. Every suite has a private bathroom, and opens either on the street or a wide courtyard. All have steam heat and electric light. On the ground floor are a model meat shop, grocery store, and bakery, at which the lowest prices are to be charged that will make the stores a little more than self-supporting. The company is capitalised at 10,000,000dols., and expects that between six and eight per cent. interest will be obtained on the money invested.

Carisbrooke. Since the end of last year, Mr. Thomas Cochrane, the Deputy Governor of the Isle of Wight, and Mr. Percy Stone, F.S.A., have been superintending the restoration work at the Royal Castle of Carisbrooke, and the castle has now recovered some of its old dignity. Carisbrooke, it is truthfully said in the "Daily Graphic," is one of the most beautiful of ancient ruins, and all who know the Isle of Wight will be glad to hear that it is being gradually rescued from the degraded state into which it had been allowed to fall. A movement is now in progress to restore the Church of St. Nicholas-in-the-Castle, which was rebuilt by King II. in 1738, on the site of the ancient church endowed in 1806. In 1860 the roof of the church was taken off and the seats removed. It is now proposed to restore the ruined church in memory of King Charles the Martyr, who was imprisoned in the castle.

Preservation of Footpaths. The preservation of the footpaths in England and Wales is a big undertaking, and the National Footpath Preservation Society should always be helped and never hindered in its work. There are numbers of these footpaths, says the annual report of this society, "yearly closed for want of enlightened opinion. Instances are constantly accumulating in the Society's record where effective advice might have secured to posterity rights which, once lost, can only with the greatest difficulty be ever regained." There is little chance of successfully protesting against the closing of a path in which there is a common interest, when once the opportunity has been lost, without incurring serious outlay in law costs. The secretary of the society points out, in an appendix to the report, that if a Parish Council is satisfied that any right of way within its area has been obstructed it can appeal to the District Council, or, if necessary, the County Council, to take proceedings. The Parish Council can also repair gates or stiles on a public footpath, although they may form part of a private fence.

Clare Church Tower. One of the most beautiful churches in Suffolk is that in the parish of Clare. The tower of this church has been for some time in a most perilous condition, the core being practically rotten about 10ft. from the base. The lower part of the tower is thirteenth century work, and the upper part is of fifteenth century construction. It was evidently originally contemplated to hang only one or two bells in the belfry, and the hanging of a peal of eight bells, in a slovenly manner, subjected the tower to an overwhelming strain. Deep fissures appeared on every side, the buttresses cracked and bulged, while the turret was separated as if by a knife from the rest of the building. The keystone of the fifteenth century window in the front of the tower was cut right in half, and the weight of the tower consequently resting on the window instead of on the arch, it was a wonder that the whole did not collapse.

Its Restoration. The tower was inspected by architects, who pronounced it to be in a hopeless state, and that the best thing to do would be to pull it down and re-build it. The Rev. James Vatcher, the vicar, did not follow this advice, but consulted Mr. Detmar Blow, the architect of the Society for the Protection of Ancient Buildings. Mr. Blow promised that he would preserve the building without any injury to its external appearance. This he has done, and the tower is now in a substantial condition. The tower, which is 77ft. in height, and 4ft. thick at the base, tapering to three at the summit, was built of flint and rubble. The work of restoration involved the scooping out of the old core and the insertion of concrete blocks of Portland cement and tiles, which were solidly united to the outer shell by the pouring of grout in the interstices. The strength of the structure has been further increased by bonds of the best blue Staffordshire bricks, which line it in places, and also secure the turret to the tower, and the latter again to the church. Altogether, it is estimated that 43,000 bricks have been used, besides all the old flints which have been put back. The work was commenced on July 4th of last year, and has just been concluded at a cost of £1,160, £300 more than was estimated, the excess being partly due to an increase of masons' wages by 12 per cent., and partly to the fact that the old wall turned out to be rotten to a greater extent than was thought. The blue bricks were supplied by Messrs. J. Knowles and Co., of London; the red bricks by Mr. Garrett, of Cavendish; the tiles by the Burham Brick and Tile Company; and the cement by Messrs. Gibbs and Co., of Grays.

St. Bartholomew's, Birmingham. The Church of St. Bartholomew, in Masshouse Lane, Dale End, has been considerably beautified under the superintendence of Messrs. Franklin, Cross, and Brookes, architects, Temple Row, Birmingham. Three stained glass windows have been placed in the east end, which have been recently removed from St. Peter's, Dale End. The subject of the centre window is "The Ascension." The side windows represent a chalice and a dove respectively. The windows were originally designed by Mr. F. Pemberton, of Birmingham, and have now been adapted, with slight alteration, and fixed in their new positions by Messrs. J. R. Lee and Co., Limited, Paradise Street, Birmingham. The appearance of the interior of the church is greatly enhanced by the addition of the windows. A handsome font has been presented to the church by several persons who have been baptised there. It is of Bath stone, and stands on four square columns, with Ionic carved capitals in Caen stone. The base and step are in Darley Dale stone; the bowl is octagonal in shape, and is moulded and fluted. The font has been designed to harmonise with the style of the east end of the church.

Reconstitution of Pompeii. The Paris correspondent of the "Times" writes that the Chevalier Pesce, the architect of the Italian Embassy in Paris, proposes to reconstitute, at the Universal Exhibition, Pompeii—not the Pompeii of the familiar ruins, but the brilliant city as it existed before the stream of fire from Vesuvius buried it from sight. This project has been in preparation for the past two years, and the most eminent men in all branches of Art and Science, have unhesitatingly promised their support to M. Pesce. "He proposes to restore to us the life of the forum, the camp, the gladiators, the Temple of Isis, the theatre bordering on the forum, the numerous shops and public baths, and all those houses, squares, and open spaces where formerly were concentrated the life, the activity, the pleasures, the celebrations and public spectacles which made this watering place by the Mediterranean one of the most attractive spots in the Italian peninsula. No detail in the life of Pompeii known to archæology in the period before the disappearance of the ancient town seems likely to be neglected in this magical evocation, and the spectator wandering across the city will find himself suddenly in the midst of that ancient life which, without this artificial aid, it would be so difficult even for the most learned imaginations to evoke. Numerous actors, in costumes archæologically accurate, will give to the city its former animation."

Ptolemaic Monuments. The shaft of a handsome rose granite column was discovered at Alexandria about twenty years ago, and presented to the municipality, but no use was made of it until recently. Dr. Schiess Bey, director of the Government hospital, offered to erect it on a prominent site near the hospital, from which it is visible far out to sea, taking upon himself the responsibility for all risks and expenses. His excavations resulted in finding the capital almost uninjured at 30ft. distance from the shaft. The length of shaft is over 34ft., with a diameter of 3½ft., and a weight of 27 tons. The base, a separate piece, is 2ft. 4in. in height by 5ft. 5in. in diameter, and the capital, which consists of two pieces, is 4ft. 6in. in height by 7ft. 9in. in diagonal breadth. One side of it is not carved, but has cuts made for inserting metal cramps, as though it was originally attached to a building, the capital considerably overhanging the base of the column. The monument when completed will measure 55ft. 7in. from the ground to the summit. The column is believed to have belonged to the temple of Saturn, which early in the fourth century was transformed into the Church of St. Michael. An inscription stating that it has been erected in commemoration of the fall of Omdurman and Khartoum, on Sept. 2, 1898, has been placed on a scroll deposited in the pedestal of gray stone, built to support the column. Another monument, also due to the initative of Dr. Schiess, is a beautiful marble column with a composite capital of green granite which he discovered during his excavations in ground belonging to the hospital. This column he erected in 1897 to commemorate the Queen's Jubilee. It stands on a knoll in the hospital garden overlooking the sea, and bears on the pedestal the following inscription: "Victoriae Britt. Reg. Fid. Def. Ind. Imp. Ivn. xxii a.d. mdcccxcvii."

The Church of the Sacred Heart, Paris. The last column of the cupola surmounting the Church of the Sacré Cœur, Paris, was placed in position on Sunday morning, last week. The edifice externally is now practically finished, with the exception of the erection of the huge cross that is to crown the central dome. The foundation stone of the building was laid in June, 1875. The interior decoration of the church is hardly begun, and it is said that it will take twenty years to complete it. Up to the present time about 1,300,000 francs have been spent on the basilica, and it is thought that as much again will have to be spent before it is definitely finished. The bulk of this sum has been supplied by private subscriptions and gifts.

A Chance for a British Firm. At the time of the recent plasterers' strike the Americans thought of sending metal walls and ceilings, which do away, to a great extent, with the use of plaster, and remove the unsightly cracking and damp stains which very often appear. Mr. Consul Powell, in his report on the trade of Philadephia in 1898, says that "the plated ceilings also, besides being extremely decorative, are a very great protection against fire. I venture to hope that before these American metal walls and ceilings can be placed on the market in Great Britain some enterprising British firm may be equal to supplying the requirements of the British public. I am informed that there is a firm in this country who are turning out large quantities of paper tiles, which are used for roofing, but I am unfortunately not in a position to give details as to the process of manufacture. They are reported to be very hard and tough, and the glazing appears to be of the nature of Japanese lac. They are reported to be exceedingly cheap, and can be fashioned in any colour or shape to suit the purchaser."

Barrow Conservative Club. The new Conservative Club at Barrow-in-Furness, which has been erected by Sir Charles Cayzer at a cost of about £10,000, was opened recently. The building, which has been designed on the lines of the architecture of the seventeenth and eighteenth centuries, has a handsome and imposing appearance. The main entrance opens into a vestibule and large entrance hall, from which wide corridors lead to the reading room, smoke room, billiard room, bar, and lavatories. The reading room, when occasion arises, may be used as an assembly hall. From the entrance hall a wide stone staircase leads to the first floor, where there are the secretary's office and committee rooms, from which there is access to a balcony. From the corridors on the ground floor entrance may be had to the Queen's Hall, a room capable of seating over 500 persons. A large gallery faces the platform or stage, on which there is sitting room for about eighty persons. It is a lofty room, well lighted by a spacious lantern roof and heated with hot water pipes. This hall may be made entirely independent of the club premises, and from the platform there is a retiring room, and below the stage are cloak and dressing-rooms.

Professional Practice.

Aston.—A new church, which has been erected at the corner of Frederick Road and Whitehead Road at a cost of £5,000, was opened recently by the Bishop of Worcester. The nave of the new structure is 83ft. long and 21ft. wide, and divided from the aisles by arcades each of five arches. The aisles are 72ft. long and 13ft. 6in. wide; width of church inside from north to south, 52ft.; north and south transepts 32ft. 6in. wide. The chancel, which is apsidal, is 32ft. by 19ft. 6in., and there are north and south chancel aisles; that on the north is used as an organ chamber. There is a well-proportioned chancel arch. The church is very bright and cheerful, and has a large west window and clerestory window, and the effect generally is good and substantial looking. The building is faced inside and out with white Leicester bricks, with bands of red Leicester bricks. The windows and columns of arcades and copings are of Bath stone. The work has been well executed by Mr. John Webb, of Villa Road, Handsworth. Messrs. J. A. Chatwin and Son, of Birmingham, are the architects; Mr. Meredith, of Aston, was clerk of works; the heating apparatus was supplied by Benjamin Parker, Limited; and Messrs. Thomason and Co., of Graham Street, made the gas pendants, &c.

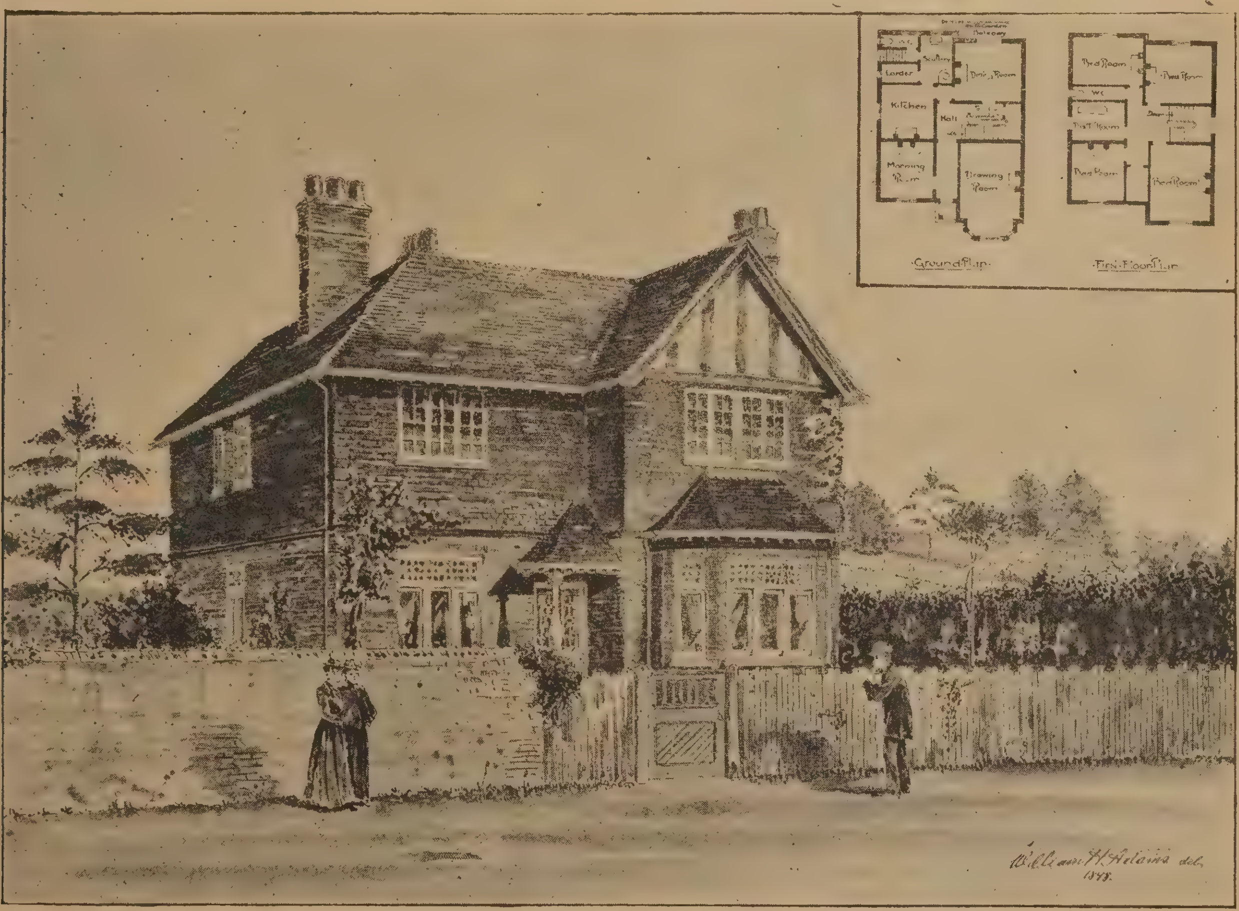
Dorking.—The small house illustrated on the next page has recently been completed for Mr. R. Adams at Dorking, on rising ground commanding a good view of the surrounding hills. Owing to the levels extensive cellerage is obtained. The materials used were red sand faced bricks of a good colour, and the upper part hung with tiles, with portions in rough cast. The builder was Mr. J. Pledge, and the architect Mr. William H. Adams.

Edinburgh.—The plans have been passed for the John Usher Institute of Public Health, which is to be erected, at a cost of £20,000 (provided by Sir John Usher, of Norton), on a site facing Warrender Park Road. A continuation of Spottiswood Street to the south will run alongside the building on the east side, and a new street—Lauderdale Street—will bound the ground on the west. The front of the building will stand back a considerable distance from the street. The building will consist of three storeys, in which will be provided a museum, large chemical and bacteriological laboratories, a lecture theatre, reading-room, and numerous rooms for scientific purposes. The extract ventilation from the rooms and fittings will be taken direct to the roof by means of fans and the building generally will be heated by hot water. The flooring throughout will be fireproof. The Institute has been planned after careful examination of similar buildings in this country and on the Continent. The walls of the principal elevations are to be built of grey stone ashlar from Doddington Quarry, lined with hollow brick inside. The exterior has been designed in a phase of classic Renaissance, taking the form of two end blocks connected by a recessed centre part. The roofs are to be covered with red tiles. The contracts having been arranged, the work will be commenced at once. A considerable portion of the ground, which altogether is about 250ft. long. and 110ft. broad, will be reserved for extensions. The architects are Messrs Leadbetter and Fairley Edinburgh.

Newcastle.—On September 29th the Bishop of Newcastle consecrated the new church of St. Gabriel's in Heaton Road. It is to take the place of the present iron church, which was erected at the east end of Rothbury Terrace in 1890, and has for long been entirely inadequate to meet the wants of the neighbourhood. Only about one half of the scheme in connection with the new church has been carried out, the cost of the structure dedicated being about £5,000. The completion of the full design, including tower, &c., is estimated to raise the total cost to about £10,000. An Order in Council, which will be made in November, will create the new parish of St. Gabriel's. The new church, when complete, will consist of nave, with north and south aisles, transepts, chancel, morning chapel, baptistry, organ chamber, vestries, &c. The design includes the erection of a fine tower on the north side of the church. The complete church will accommodate 1,000 worshippers. The dimensions will be: Length from east to west, about 150ft.; breadth across the naves and aisles, 55ft.; breadth across the transepts, 114ft. The nave arcade is of moulded stone, with shafts joining a hammer beam roof. The clerestory and other principal windows are worked in open tracery. The baptistry, situated immediately to the west of the south porch, is apsidal. The morning chapel, situated at the east end, is also apsidal, and will be fitted with inclosing oak screens, as also will the arcading between the chancel and the ambulatory. The floor is of solid concrete covered with wood. There are five doors to the church for ingress and egress. The whole edifice will be built of stone, and the roofs covered with green slating. The interior wood fittings, and especially the benches and screens in the chancel, morning chapel, and baptistry, are intended to be in oak—marble, alabaster, and bronze being used for other fittings. These, with stained glass windows (which are at present glazed with plain glass), will afford abundant opportunity for individual generosity. The church is designed in the style of architecture which prevailed in England in the fourteenth century. Immediately to the west of the church, the vicarage will be erected, and space has been allotted on the church site for a parish room, &c. Considering the very fine site these buildings will occupy, they should form a very dignified and picturesque group. The portion of the church as already built consists of nave, south aisle, and porch only, and will accommodate 500 worshippers. The short chancel and vestries are temporary. The stone of which the church has been built has been obtained from several quarries, chiefly from Burradon and Blaxter on Ottercaps. The internal fittings are all of the most temporary nature, all resources having been devoted to the permanent building. Mr. Frank W. Rich, of Newcastle, is the architect.

Sunderland.—On December 8th, 1897, after several years' consideration, the Sunderland Town Council decided to erect a technical college. The site in Green Terrace was purchased in March, 1896, for £3,150. Mr. J. M. Brydon, the architect for the new Government offices at Whitehall, was nominated by the President of the R.I.B.A. to adjudicate on the plans, and upon his recommendation those of Messrs. Potts, Sons and Hennings were selected and secured the first premium of £100. For the building and part equipment of the college, the tender of Mr. John White, of Sunderland, amounting to £18,560, has been accepted. The building has been designed in the English Renaissance style and so that all the departments of the college may be readily reached and be under the easy supervision of the officials. The main corridor will be 8ft. wide and the examination hall 50ft. by 30ft. Over the large hall is the chemical laboratory, 71ft. by 30ft. There is a clear space in this room of 29ft. to the ceiling, which contains a turret covering an extract ventilator to convey fumes from the benches. Space is provided here for eighty-four workers, while the chemistry lecture theatre is designed to seat sixty students. The physical laboratory, the preparation room, and the physics lecture theatre are situated in the basement. The corner block has been carried up as a dwarf tower, providing an observatory. The college will have an extensive curriculum. The authorities of Durham University have been approached with a view to a connection being established between the two institutions that would enable the students at the Sunderland college to take the Science of Arts and Letters degrees with the least possible trouble and expense, and it is probable that an application for affiliation will be made by the Sunderland authorities, to be followed by incorporation if the requirements of the Durham senate are complied with. In the latter case Sunderland students will be as favourably placed, so far as science degrees are concerned, as their brethern at the Newcastle College of Science. The foundation stone of the new building was laid on September 27th, and the work is expected to be finished in the spring of 1901.

Wolverhampton.—A new swimming bath has been built at the side of the old baths in Bath Place by Messrs. Wilcock and Co., of Wolverhampton, from designs by Mr. Bradley, the borough engineer. The bath itself is 81ft. by 31ft., and is roofed over with a single span, and lighted by a skylight of rough plate glass. On the sides of the bath there are windows provided, in which electric lamps will be placed to light the bottom—an ingenious contrivance. There is a gallery on three sides of the building. The prominent feature of the main elevation is a large gable with circular windows. The building is built of brick with terra-cotta dressings.



A HOUSE AT DORKING. WILLIAM H. ADAMS, ARCHITECT.

The Crystal Palace School of Art has just commenced its fortieth session. A more extensive suite of rooms than those previously occupied has been set apart in the south wing for the students.

The Smithfield Martyrs' Memorial, which was erected at St. Bartholomew's Hospital in 1870, and provided by the Protestant Alliance, has been renovated, and was recently unveiled by Mr. B. Nicholson, of the Executive Council of the Alliance.

Keystones.

A New Church at Brynmaen, Colwyn Bay, has been built, at a cost of £10,000.

The temporary Bridge at Kew will not be opened before October 16th.

A Bunyan Memorial Window is shortly to be erected at St. Saviour's, Southwark, S.E.

A New Church at Woolmer Green, Herts., is being erected at a cost of between £3,000 and £4,000.

A New Station at Stannergate, Dundee, is being erected by Messrs. D. P. How and Son, at a cost of £7,000.

A Crematorium at Leeds is proposed to be built, and a committee is now gathering information on the subject.

Medmenham Abbey, Bucks., is for Sale, after being restored at a cost of £10,000. It was founded by the Cistercians in 1200.

A handsomely-carved Oak Pulpit has been removed from Curzon Street Chapel, Mayfair, W., to the parish church at Penn, Bucks.

Kirkstall Abbey, Leeds.—A waiting-room, a tramway office, a lodge, and an ornamental gateway are to be erected near the tram terminus at Kirkstall Abbey at a cost of £2,833.

A New Organ at the Church House, Westminster, S.W., has been erected in the Great Hall, and Sir Walter Parratt will give a recital on it on October 7th. It has 1,774 pipes, and is enclosed in an oak case designed by Sir Arthur Blomfield.

A New Wesleyan Church at Penarth is being erected at a cost of £7,000. Messrs. Jones, Richards, and Budgen are the architects, and Messrs. Jones Bros., of Cardiff, are the contractors. The foundation stone was laid on September 27th.

Big New Wharf on the Thames.—The Dundee, Perth, and London Shipping Co. are now building a new wharf at Limehouse, E., at a cost of £100,000. It will take between two and three years to complete.

Proposed Improvements at Nottingham.—It is proposed to set back the building lines of High Street, so that this street will be more than double its present width. The proposal has been under consideration for years, but is now coming to a head.

A New Theatre at Berndorf, erected a year ago by Herr Arthur Krupp, for the workmen employed at his huge metal factories, was opened on Wednesday. The theatre is in old German style and is decorated in excellent taste, the prevailing colours being white and gold. There is accommodation for 500 persons.

A Diminutive Village is that called Perivale, which lies two miles north of Ealing. It is 626 acres in extent, and consists of thirty-four inhabitants, who occupy five houses which have at sundry times been built. The village boasts of a church, which is a quaint-looking edifice, picturesquely surrounded by trees.

The Loan Collection of the Artists' Guild Exhibition, to be held at Albert Hall in November, under the patronage of her Royal Highness Princess Christian of Schleswig-Holstein, is under the direction of Lady Agneta Montagu, who will be extremely obliged if anyone willing to contribute eighteenth century plate, miniatures, snuff boxes, Battersea enamels, or other *objets d'art*, will communicate with her immediately at 69, Eaton place.

The Doge's Palace at Venice.—A correspondent to the "Times" points out that the statement made by the Rome correspondent of that journal to the effect that Cavalieri Boni, director of the Forum excavations, restored the Doge's Palace at Venice is incorrect. Signor Yendrasco, of the Public Works of the Kingdom of Italy, did the work, Boni being a young draughtsman under him. It is a stupendous piece of civil engineering, probably the best piece of restoration ever done.

York Minster.—Nearly £12,000 has now been received towards the cost of restoring this Minster.

Frome St. Quinton Church has been restored from designs by Mr. J. Nicholson Johnston, architect, of Yeovil.

The Smoke Nuisance.—For causing black smoke, about eight Manchester firms were fined on September 27th.

The Statue of Daniel Owen, the Welsh novelist, is to be executed by Mr. Gosforth John. The model is now nearly finished.

The Famous Muckross Estate, embracing the Lakes of Killarney, will be put up for sale by public auction on November 28th next.

Mr. Geo. Pearson, architect and surveyor, formerly of 32, Finsbury Pavement, E.C., has removed to new offices at 58, Moorgate Street, E.C.

The Jules Simon Statue.—The French sculptor Frémiet has completed his sketch of this work, which is to be set up in the Place de la Madeleine.

The New Blea Tarn Reservoir, to supply Lancaster and Morecambe, is now nearing completion. It will hold 120 million gallons, and is costing £60,000.

Building Accident.—At Dunoon, on September 26th, a wall about 15ft. high collapsed (on account of the wet weather), burying two workmen, both of whom were injured.

Westminster Bridge is being painted at a cost of £4,000. The metal grooves running alongside each kerb are to be removed and concave channels will replace them.

A Fire at a Kilmarnock Brickworks, belonging to Messrs. Gilmour, Morton and Co., Ltd., occurred on September 28th. About a thousand pounds' worth of damage was done.

Two New Piers for Floating Fire-engines—one near Blackfriars Bridge, the other at Deptford—are now being erected for the London County Council at a cost of about £1,500.

Bath Abbey.—At a meeting held on September 29th, it was finally resolved to proceed with the restoration of the west front at a cost of £2,000. Mr. Jackson is the architect in charge.

A New Park at Glasgow, called Richmond Park, extending for forty-four acres on the south side of the Clyde, was opened on September 27th. The purchase money was £44,000.

Improvements at Plymouth.—A Local Government Board inquiry was held at Plymouth on September 28th with regard to certain sewage and street improvements, estimated to cost £44,300.

A New London Park.—The Ealing District Council have decided to purchase the Manor House and park adjoining Ealing Green and Lammas Park, at a cost of £40,000. The Manor House is a fine specimen of Inigo Jones's work.

A £300,000 Scheme for Southend.—The Southend Town Council are pressing forward a scheme for widening the Marine Parade, and for constructing a long sea wall to form a marine lake in which a certain depth of water can always be kept.

Another Hampstead Landmark to be Demolished.—The house at the corner of West End Lane, Hampstead, N.W., known as "The Chimes," has been sold with the estate on which it stands. It was built from Pugin's designs for the eccentric Royal Acadamician, J. R. Herbert, who named it after Dickens's famous Christmas story.

A New Paris Art School.—An American School of Fine Arts, Music, Singing, and Declamation will shortly be inaugurated in Paris. The institution is in the Avenue d'Iéna, and has been taken up by the Government at Washington as the result of the efforts of an American lady, Miss Mathilde Smedley. It is stated that forty-five American States will send over ninety students to form the nucleus of the school, and that it is contemplated to build a palace to accommodate five hundred students, at a cost of £200,000.

A Statue to Richelieu is proposed to be raised at either Poitou, where the cardinal received his political education, or at Lucon, the episcopal throne of which he occupied.

A New Organ for St. Augustine's Church, Sheffield, is to be built, at a cost of about £800, by Mr. Albert Keates, of Charlotte Road, Sheffield. The church itself has only recently been erected.

Smoke Prevention in Berlin,—At present there is no Smoke Act in force at Berlin, but it is announced that after January 1st, 1900, reforms will be introduced, and no black smoke will then be allowed.

The Statue of Mr. Gladstone by Mr. Adams Acton, who was commissioned by the Gladstone Memorial Committee at Blackburn, is finished, and will be unveiled by the Earl of Aberdeen early in November.

Alterations to the Royal Vaults at Windsor are now being carried out by command of Her Majesty. They are beneath St. George's Chapel. An arched doorway is being put up at the entrance, and the electric light is being installed.

Belfast Shipbuilding Accommodation.—It is reported that the Belfast shipbuilders are in negotiation with the North British Railway Co. for the purchase of Seafield Docks, Kirkcaldy, and a large area of adjacent land, for the purpose of removing a part of their works from Belfast.

New Thames Lock.—At a recent meeting of the Hammersmith Vestry a report was presented from the conference of local authorities convened to take steps for the construction of a new lock on the Thames below Wandsworth. The proportionate cost to Hammersmith is £29,995, and the cost is estimated at £220,000. It was agreed by the Vestry to contribute its proportion of the cost as specified.

New Seamen's Institute.—The Missions to Seamen Society have purchased what was formerly a public-house, opposite the Board of Trade Shipping Office, near the Victoria Docks, and are converting it into a free institute for sailors and fishermen. Expensive drainage works have been effected, but the necessary alterations and equipment of the building have now been stayed for lack of an additional £200.

New Memorial Window.—A window has been placed in the church at Scrivelsby, Lincolnshire, by Mrs. Dymoke, in memory of her late husband, Francis Seaman Dymoke, the Queen's Champion. Before the time of George IV. it had been usual for the Dymokes, after performing the office of Champion at Coronations, to receive the honour of the Bath, but that custom then ceased.

Opening of a Church at Dunfermline.—About three years ago a dispute arose in the Viewfield Baptist Church, Dunfermline, and as the result a section of the congregation left and have since worshipped in halls. In the interval a church, with 500 sittings, has been erected at the south-east end of Dewar Street at a cost of about £2,000. The edifice, which is to be known as the West Baptist Church, has recently been opened for public worship.

Cheltenham's Art Gallery.—The Earl of Rosebery has provisionally consented to formally open the new Municipal Art Gallery at Cheltenham at the end of October. This building has been erected as a memorial of the Diamond Jubilee, and was presented to the town by Baron de Ferrieres, who has stipulated that one of the galleries shall be reserved for thirty-five works by old and modern masters that will be included in his gift.

Free Library for Keighley.—It is understood that in connection with the scheme for widening North Street, Keighley, the Improvement Committee of the Corporation will probably purchase the whole of the North Villas estate, as well as the vacant land to the south of it, and that a proposal to that effect will come before the next meeting of the Town Council. Although not bought ostensibly for the purpose, it is thought that the surplus land may be utilised as a site for the Carnegie Free Library.

New Patents.

The following abridged description is specially drawn up for THE BUILDERS' JOURNAL AND ARCHITECTURAL RECORD *by Messrs. Hughes and Young, Patent Agents, 55 and 56, Chancery Lane, London, W.C., who will give advice and assistance free to our readers on all Patent matters.*

11,013. Door, &c., Knobs.—Patentee: F. H. Collins, of Cumberland Street, Birmingham. Relates to the introduction of a ball bearing between the neck of the knob and the rose of mortice and rim locks and the like. A groove is made in the rose to serve as a race for the balls. A corresponding race is made in the neck of the knob. The balls are inserted by removing the screwed plate.

11,043. Roofing Tiles.—Patentee: A. Leszynski, of Sackheimrechte Strasse, Konigsberg, Prussia. The lower edges are rounded or bevelled to diminish the resistance to wind and prevent lifting of the tiles, and the upper surface of each tile is made concave to facilitate the discharge of rain water when the roof has only a slight fall.

11,094. Paint, Whitewash, &c., Brushes.—Patentees: W. W. Kinniburgh, of Park Terrace, and W. Barr, of Stirling Street; both in Airdrie. Relates to a device for fixing a brush at a variable inclination to the handle. The handle is fixed in a socket carrying a sector, on which pivots a frame, in which the handle of the brush is clamped by screws. The frame can be fixed at any inclination by the screw engaging with the holes or recesses in the sector.

New Companies.

Kitson Lighting and Heating Syndicate, Limited.

This company was registered on September 15th, by Ingle, Holmes and Sons, 20, Threadneedle Street, E.C., with a capital of £10,000 in £10 shares, to acquire under certain agreements made by this company with A. and E. Kitson and W. Clapham, patent rights relating to improvements in lighting and heating apparatus, and to develop and work the same.

Shoeburyness Brick Company, Limited.

This company was registered on September 19th, by E. F. and H. Landon, 53, New Broad Street, E.C., with a capital of £40,000 in 10,000 cumulative preference shares of £1 each and 30,000 £1 ordinary shares, to acquire, upon the terms of an agreement made by this company with W. Weeks and others, certain freehold and leasehold properties at Great and Little Wakering and Barling, in Essex, and to carry on the general business of brick, tile, and pipe manufacturers. There are to be not less than three nor more than seven directors. Qualification, £500. Remuneration to be fixed by the company.

Societe Generale Des Ciments Portland Sestao, Limited.

This company was registered on September 23rd, by H. B. Brandreth, 9, Jermyn Street, S.W., with a capital of £40,000 in £4 shares, to adopt an agreement made August 31st by Paul Lafarge, for this company, with G. Maurel, and to carry on the business of cement, brick, tile, and pipe manufacturers; to explore, work, manage, and control quarries or properties containing chalk, limes, phosphates, &c.; to carry on all kinds of agency and commission business; to acquire, develop, and work any patents, patent rights, &c. The directors are to be elected by the signatories. Qualification not specified. Remuneration to be according to profits.

Chorlton Land and Building Company, Limited.

This company was registered on September 15th, by Waterlow Brothers and Layton, Limited, Birchin Lane, E.C., with a capital of £10,000 in £1 shares, to adopt an agreement made by this company with E. Nicolas and J. Beresford, and to carry on the general business of builders and contractors, joiners, plumbers, glaziers, gasfitters, brick and tile makers, financial and general agents, carriers, &c.

J. Whitehead and Co. (Peckham Wharf), Limited.

This company was registered on September 22nd, by Wickes and Champion, 7, Union Court, Old Broad Street, E.C., with a capital of £10,000 in £1 shares, to acquire the business of brick, lime, cement, and timber merchants, as now carried on at Peckham Wharf, Peckham, Surrey, together with all or any of the properties, stock-in-trade, assets, and liabilities thereof, to develop the said business, and to carry on the business of builders and contractors in all its branches; to acquire and turn to account any patents, &c., and as house and estate agents. Registered without articles of association.

Giddings and Dacre, Limited.

This company was registered on September 8th, by Messrs. Crowders and Co., 55, Lincoln's Inn, with a capital of £90,000 in £10 shares (5,000 preference, 4,000 ordinary), to adopt and carry into effect two several agreements, each made between A. Giddings of the one part and this company of the other part, for the acquisition by purchase or otherwise, as a going concern, of the business of engineers, &c., as now and hitherto carried on by Messrs. Giddings and Co., at 19, Chapel Street, Salford, near Manchester, to develop and extend the same, and, generally, to carry on in all or any of their respective branches the businesses of manufacturers of and dealers in chemical lead, sheet lead, lead and composition pipes; as sanitary engineers, manufacturers of and dealers in every description of sanitary ware and appliances, glass embossers, cutters and engravers, glass painters and stainers, lead light makers, lead, glass, brass, iron, copper, and zinc merchants, plumbers and glaziers, builders and contractors, ironmongers, ovenmongers, bar fitters, lock and bolt makers, boiler makers, lacquerers, bronzers, gas engineers and gas fitters, gas meter makers, manufacturers of tanks, cisterns, gasfittings, oils, colours, varnishes, boiler and roofing felts, stoves, grates, and all kinds of heating apparatus, agricultural implements of all kinds, lightning conductors, wire drawers and workers, wheelwrights, indiarubber manufacturers, tin-plate makers and workers, stone and marble masons, picture frame makers, pump makers, electro-platers, gilders, window-blind makers; as chemists and druggists, drysalters, drug grinders; as electrical engineers, producers and suppliers of electricity for the purposes of light, heat, or power; manufacturers of cables, wires, lamps, meters, and other electrical apparatus and appliances; as metal founders, forgemen, iron and steel converters, engine and boiler makers, mechanical engineers, machinists, fitters, metal workers, wire drawers, tube makers, smiths, builders and contractors, or any other business capable of being carried on in connection with the above businesses or any one of them; to develop the resources of land by clearing, draining, planting, farming, or building thereon. The signatories (each one share) are Messrs. A. Giddings, S. Dacre, S. Giddings, F. W. Holmes, J. E. Perkins, L. Giddings, and F. Giddings. The first directors (of whom there shall be not less than three nor more than five) are Messrs. A. Giddings, F. W. Holmes, and J. E. Perkins. Qualification, £2,000. Remuneration, £15 per annum each.
